SWENSON GRAY GRANITE.
SWENSON ANTIQUE GRANITE.
ROUGH, DRESSED and POLISHED GRANITE for Buildings and Memorials.

Swenson Gray Granite

A warm toned, light gray granite, of fine to medium grain and of even texture. It is technically known as "muscovite-biotite" granite. The soft brownish color of the muscovite crystals, blended with the light gray of the quartz, feldspar and finely distributed biotite crystals, produces the warmth and pleasing texture which make this granite especially attractive and desirable.

Swenson Antique Granite

A special variety of granite which is meeting with enthusiastic approval. The delicate blending of brown and gray gives the warm, antique character to the granite which one associates with fine, old ivory.

Strength, Durability and Working Qualities

The high crushing strength of our granite, indicative also of its other high grade qualities, especially adapts it for exterior uses. Watertown Arsenal tests give this granite a crushing strength of 30,830 lb. per square inch square to the rift, and 23,860 lb. parallel to the rift.

As to durability and weathering qualities, few materials can offer more convincing proof. We refer to two splendid examples of Concord Granite exposed to the rigors of New England climate for over a century, namely the State Capitol at Concord, N. H., erected in 1816-1819, and the Old State Prison erected at Concord in 1812. Quoting Dr. Geo. P. Merrill, Curator of Geology, U. S. National Museum, "both buildings are in admirable state of preservation, and evidently, so far as the stone is concerned, good for centuries to come."

The fast working qualities of both our standard gray and antique granites contribute materially to maximum economy in production. Again quoting Dr. Merrill, one of the remarkable features of Concord Granite "aside from its color, texture and freedom from flaws, pyrite and other injurious constituents, is the remarkable ease with which it can be worked."

Facilities and Economy of Operation

Our present quarries, in active operation over sixty years, have been carefully developed and modernly equipped for large scale and economical production.

In our cutting plant it has been our constant study to make this the most up-to-date and efficient granite plant in the country. The equipment includes sawing, polishing, turning and handling equipment of the most modern character, also a completely equipped sandblasting department. Dust removal systems, installed throughout the plant, provide exceptionally healthy working conditions, giving us the pick of skilled workmen. This, combined with a fast working granite and efficient plant facilities, ensure the best of workmanship and service at minimum cost.

Services

Our Concord, New York, Chicago, Cleveland and Detroit offices are always prepared to render estimating or consulting service. Samples of our granite, finished as desired, will be furnished on request.

We are prepared to handle any type of granite work, whether it involves highly skilled and intricate handwork or the more modern type adapted to maximum use of machine processes.

For general information on granite, its economical use, design and specification, see the catalogue in this section of SWEET'S ARCHITECTURAL CATALOGUE of the National Building Granite Quarries Association, of which we are a member. Samples of our granite and the standard building granite finishes are displayed in the Association exhibits in New York, Philadelphia and Boston.

Sandblast Carving and Ornament

We are experienced and well equipped for sandblast work. See the Association pages for description of this process and its interesting possibilities.

References

Our Concord Granite has been used for many years in fine buildings and memorials in all parts of the country. We will gladly furnish a list of such projects most accessible for your inspection and reference on request.

Concord Granite

Composition—A holocrystaline, granular rock composed of quartz, a potash feldspar, and muscovite-biotite (potassium and magnesium iron mica). The feldspar crystals being very small, the granite is of very fine grain.

Color—The color of the granite is blue gray, the shade being determined by feldspars in the quarry.

Quality and Usage—Being of a very fine grain and of especially high quality, Concord granite is primarily used for buildings of artistic merit and imposing design, such as memorials, public buildings, mausoleums and other structures of a permanent character.

Production—The cutting plant—one of the largest and best equipped in the United States—is located near our quarries at Concord, N. H., enabling us to turn our large quantities of polished, dressed and rough granite in a comparatively short length of time.

Shipping Facilities—We are located on the Boston & Maine R. R., with connections with the Boston & Albany R. R., the Central Vermont Ry., and the New York, New Haven and Hartford R. R., thus making possible the shipping of our granite to any part of the United States and Canada.

Advice on Proposed Work

Our designers will be glad to consult with you regarding the cutting of designs and the reduction of cost.

Unnecessary expense may be avoided by considering the finish of the stone for different parts of a building and the adaptability of design to cutting methods generally employed, depending on the location and the exposure of the granite to smoke and dirt, and its position as regards visibility to the public eye.

Estimates and samples gladly submitted on request.

WOODBURY GRANITE CO., INC.

Quarriers and Finishers of Woodbury Gray and Bethel White Granites Standard for Buildings, Monuments, Memorials and Mausoleums

BURLINGTON, VT.

BRANCH OFFICES

NEW YORK, N. Y., 1258 Graybar Building — CHICAGO, ILL., 734 Builders Building

HARDWICK, VT. — BETHEL, VT.

QUARRIES: BETHEL, VT., WOODBURY, VT.

Products

Woodbury Gray, the standard building granite.

Bethel White, the whitest and one of the hardest granites.

Woodbury Gray

This granite has come to be recognized as one of the three or four granites in this country accepted as standard building granites. It is of a medium grain and medium gray in color. Its technical classification is biotite.

Bethel White

Bethel White has the distinction of being the whitest and one of the hardest known granites. It is ideal for the highest type of buildings, memorials and mausoleums. Its grain is coarse inclined to medium and is of a beautiful warm white faintly mottled with gray. It is technically classified as quartz-monzonite.

Quarries and Cutting Facilities

The quarries of the Company are three in number. Two are located at Bethel, Vermont, where the beautiful Bethel White is produced. The largest plant of the three, at Woodbury, Vt., produces Woodbury Gray granite.

The production of Woodbury Granites demands the full facilities of the two largest cutting plants in Vermont. Located at Hardwick and Bethel, these plants have banker space for 900 granite cutters and carvers, with attendant helpers and clerical force. With our new facilities for cutting, our production will be increased many times over.

NEW DELIVERY SERVICE OF INTEREST TO ARCHITECTS

By means of new processes for the finishing of granite, adopted by this company for commercial production, we are now able to produce and deliver granite in a fraction of the time that was required by the old hand methods. With a properly run job and orders placed promptly, we can deliver granite as soon as required.

Some of the machining and methods of producing granite by us under the new processes have been used to some extent by monumental granite cutters. We are taking the lead in adapting new machinery to commercial uses. From this it can be seen that the Company is in a most strategic position with regard to the delivery of granite on short notice.

Our new method of finishing granite produces surfaces in kind and character superior to any produced by the old hand method and the time required to produce the finish is greatly reduced.

The ability of a quarry and organization to supply sufficient granite for a large job is of vital importance to the architect who specifies granite. Woodbury granites have been used for years and are a recognized standard for fine granite work.

Although thousands of feet of both Woodbury Gray and Bethel White have been taken from our quarries, the quarries are among the largest granite deposits in the country and contain a sufficient amount of the finest granite for years and years to come.

Continued on next page

WOODBURY GRANITE FOR FINE BUILDINGS, MONUMENTS AND MAUSOLEUMS

Quality and Quantity

The granites quarried by Woodbury Granite Co., Inc. are of the finest quality and suitable for monumental, public, commercial and residential buildings. Woodbury Gray granite, under Government test, withstood a pressure of 20,836 lbs. before its particles separated and the stone crushed.

The State Geologist of Vermont, in specifying the size of a monolithic column of Woodbury Gray says, "It is doubtful if a larger shaft can be obtained at any quarry in the world than upon this mountain."

The great ledges of Woodbury show that large sheets of gray can be measured on the quarry face 20 and 30 feet in depth, 200 feet in length and extending back into the ledge without seam or flaw.

The Reputation of Woodbury Granites

Woodbury granites are so well known to the Architectural profession that they hardly require a description. They have been used for the last 40 years for all kinds of U. S. Government, State and Municipal Buildings as well as private residences where the finest and most enduring material was desired. As to how the granite stands up and what its general appearance is after exposure for a number of years, we can refer you to examples within a short distance of your office.

The Grading of Standard Granites

Granites are graded according to the following characteristics: Color, hardness, grain and workmanship. The color is determined by its feldspar, the hardness by the quartz and feldspar and the proportion and hardness of the feldspar govern the grade of hardness. The grain is graded from very fine to very coarse according to the size of the feldspar crystals. The size of the crystals give to granite its various natural textures but do not affect its structural qualities.

Classification of Workmanship

Commercially the qualification of workmanship obtainable with these granites has been graded by usage into three classifications:

Monumental Building Grade—For buildings monumental in character, where architectural merit predominates over utility and economy, such as national, state and city government buildings, court houses, libraries, public memorials, etc.

Commercial Grade A—For high class buildings designed for utility, dignity and stability, such as banks, insurance and office buildings, churches, schools, etc.

Commercial Grade B—For buildings designed for utility and economy, the workmanship will meet all structural requirements and present a good appearance.

Product

INDIANA LIMESTONE, in such recognized grades as: Select and Standard Buff, Select and Standard Gray, Variegated and "Old Gothic."

Facilities

BLOOMINGTON LIMESTONE COMPANY operates proven quarry properties consisting of 497 acres located in Monroe County (Bloomington District), Indiana. These properties are already producing approximately 3,000,000 cubic feet of Indiana Limestone annually.

Two sawing mills and two cut stone plants are operated by the BLOOMINGTON LIMESTONE COMPANY, having a capacity of approximately 30,000 cubic feet of finished cut stone per month.

Service

Architects, general contractors and owners are invited to write to us for any information or special service which the extensive experience of members of our organization may enable us to render; with the assurance that such request will not entail annoying sales follow-up on our part.

100 YEARS OF SERVICE

ST. PAUL STONE QUARRIES CO.

Pioneer Quarriers and Manufacturers

OFFICE, QUARRIES AND MILL

ST. PAUL, IND.

REPRESENTATIVES IN FOLLOWING CITIES

CHICAGO, ILL. CINCINNATI, OHIO CLEVELAND, OHIO COLUMBUS, OHIO DETROIT, MICH.

Product

St. Paul Stone, a non-absorbent, non-staining extremely dense "Blue-white" Crystal Limestone. Not to be confused with sandstones, hard or standard Indiana limestone. We invite comparison of the physical analysis with that of other stones.

ST. PAUL STONE
IMPERVIOUS-DURABLE
Retains its original Color indefinitely

CHEMICAL ANALYSIS

Calcium carbonate	70.54%
Magnesium carbonate	20.53%

CHEMICAL ANALYSIS (Continued)

Silica	6.57%
Alumina	1.33%
Iron oxide	0.71%

PHYSICAL DATA

Specific gravity	2.69
Weight per net cu. ft.	168 lb.
Compressive strength parallel to bed	25,700 lb. per sq. in.
Perpendicular to bed	24,400 lb. per sq. in.

Adaptability

Due to our product's unique and individual ability to retain always its original color in place (minus honing and polishing) at or above the grade line, it is particularly adapted for base course and step work, together with such items as door and window sills, platforms, flagging, curbing, coping, chimney caps, etc.

Besides machine cut stone, our product is available in any quantity for rustic work such as hand cut steps, rock-faced ashlar and any other stone need, be it landscape or architectural; for the finer types of churches, residences, etc., where a true marble appearance that will remain is especially desirable.

Facilities

The architect may specify "St. Paul Stone" for any purpose with full assurance that this company with its modern equipment specially adapted to working this hard close grained stone will deliver it promptly, cut ready to set. Samples and estimates sent upon request.

Specification Notes

Need not to be other than a paragraph mentioning where our stone is desired. We will comply with the usual stone specification in every other way. Savings can be made at the job by omitting waterproofing, non-staining cements, etc. Any hard stone finish is applicable to "St. Paul Stone." We recommend smooth finishes, bush-hammered 4 to 12 cut with or without margins, etc.; for rustic work, rock-face and pick pointed.

Low Cost

St. Paul Stone is more expensive than sand or lime stones but less costly than granite (to which its durability favorably compares); the user will appreciate the opportunity our product affords.

St. Paul Stone assures an enduring building free from unsightly stains and deteriorating moistures which are conspicuous because close to the eye.

Product

INDIANA LIMESTONE (which is often called "Bedford Stone").

Gray (or Blue), Buff and Variegated (or mixed); also certain other varieties, including "Old Gothic"—a grade showing interesting texture and color-tone variations; also the rough Sawed-four-side Indiana Limestone of Short-length stock for Random Ashlar, range work and other informal types of Ashlar Facing for moderate cost buildings.

See complete listing of classifications under the present system of grading the product on following pages.

Indiana Limestone

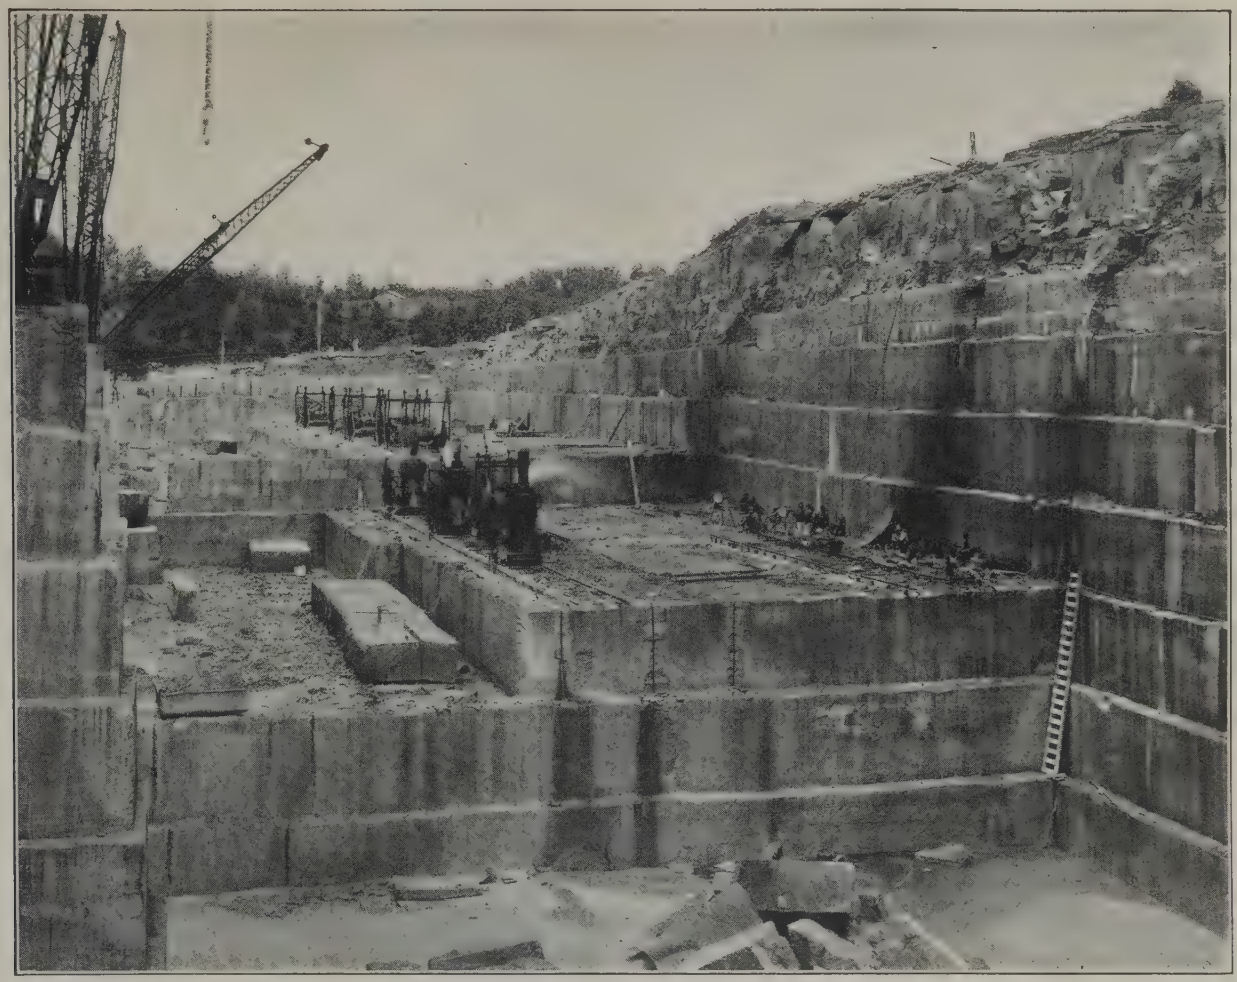
Indiana Limestone is a *natural stone,* not a manufactured product. It is a fine even-textured non-crystalline limestone of beautiful soft color-tone, ranging in the various grades from a somewhat grayish buff, on through silver gray to a medium-toned gray of slightly bluish cast. The massive deposit forming the ledges in the hills of Southern Indiana, from which this fine, easily worked, yet durable and permanent stone is quarried, constitutes one of the most wonderful and probably the most useful, of building stone deposits in the world. An interesting booklet, Volume 1 of the Indiana Limestone Library, which describes the stone and its structural qualities, will be sent free upon postal request.

Cost

The cost of this stone compared with substitute products is always such as to make it economically available for use in all classes of buildings—especially store fronts and small commercial buildings, schools and institutional work—as well as for larger and more monumental work for which a natural stone is always used.

The rough sawed strip stone makes it in every way suitable for use in decidedly moderate cost houses.

Continued on next page



Ledge at the Indiana Limestone Company's Dark Hollow Quarry

The largest single ledge in operation in the Limestone district, measuring 1400 ft. long, 140 ft. wide and 60 ft. deep. This will cube 11,760,000 ft., approximately 20,000 large car loads of Indiana Limestone.

The New Company's Facilities

Indiana Limestone is found only in two counties of the state of Indiana (Lawrence and Monroe).

The INDIANA LIMESTONE COMPANY owns, approximately, 6,600 acres of land, of which over 1,600 acres are proven stone land available for immediate quarry development.

Engineers estimate that at the present rate of production and shipment, there is sufficient stone in these proven areas for seventy years' operation.

INDIANA LIMESTONE COMPANY has a quarrying capacity of 16,000,000 cu. ft. per year, a sawed stone capacity of 6,000,000 cu. ft., and a cut stone capacity of 3,000,000 cu. ft. per year.

Millions of dollars are invested in machinery, equipment, buildings, and a network of railway tracks.

The entire production operation is handled with precision and efficiency, more like large-scale manufacturing than quarrying, as quarrying is ordinarily carried on. This enables the industry to give rapid delivery and most satisfactory service, regardless of the quantity of material required, or the size or number of contract operations.

The merging of these vast limestone interests into one well-financed and properly managed organization is in line with the whole trend of modern large-scale business, the object of which is to secure the benefits of quantity production and the efficiency that goes with this method. More effective co-operation with the architectural and building professions, and the production of Indiana Limestone at a price that would make it more attractive to the public, were the principal ideas behind the consolidation.

Practically all of the long established and proved quarries from which this dependable stone has been produced for generations are owned by this company.

Transportation Facilities

Owing to the fortunate central location of quarries and unsurpassed railroad facilities, Indiana Limestone can be transported to all points in the United States and Canada with exceptional promptness and at minimum cost.

Distribution of Stocks

Good sized stocks of Indiana Limestone are carried by cut stone contractors in nearly all the principal cities of United States and Canada.

It is a standard product available in quantity for prompt deliveries at all times.

Architects Service Bureau

Architects and builders are cordially requested to make free use of the Architects Service Bureau of the company as a source of reliable information regarding its product, its most effective and economical use and for assistance on any problems pertaining to structural design and use of Indiana Limestone in building construction.

The activities of this Technical Department are chiefly educational, comprising investigation and research work, publicity, technical service and assistance to the architectural profession, to the trade, and to others directly interested in the use of the product.

Continued on next page

Selection of Most Suitable Material

The selection of the kind or grade of stone to be used for a particular building often does not receive the careful consideration which it deserves. When a building is intended to become the art or cultural center of a community, its administrative headquarters, or the realization of the life-dream of some influential citizen, it is natural to think that only the very best is good enough. In such cases, there is a temptation to specify the fine-textured "Select" or what is really selected stone, the highest in cost, for all parts of the work. This is rarely necessary or desirable.

All grades of Indiana Limestone are equal—in-so-far as soundness is concerned. The production processes employed in a cut stone mill, further, are such as will automatically eliminate any blocks or pieces that contain planes of weakness, as in the average run of work the stresses set up in machining the stone and in handling it by the travelers from one machine to another, are greater than would be permitted in building, and serve to test effectively all of the stone as it passes through the various milling operations that are employed to shape and prepare it for its position in the building.

For many types of structures, especially for sawed-finish wall facing, the "Old Gothic" grade, which is decidedly low in cost is the most fitting to use. The moderate cost Variegated grade is suitable for all purposes, either for trim or for all-stone faced buildings.

During the past few years the proportionate use of the gray stone on account of its fine, close, even texture has been rapidly increasing. Many architects now prefer and specify it regularly, on account of its density, uniformity and fine weathering qualities, together with dignity and pleasing color-tone which becomes progressively lighter in shade with the passing years. It most effectively resists the accumulation of grime and in appearance is the nearest approach to a costly light-colored fine grain granite that it is possible to obtain in the field of an easy-working, moderate cost building stone.

Architects will never regret specifying this material for their best work, as exemplified by some of the finest buildings in America that have been constructed of it.

The well-known Oolitic Limestone of Indiana, formerly called Bedford Stone, is commercially available only in Lawrence and Monroe Counties, and the architect should protect both his client and himself against substitutes. All of the long established and proven quarries from which this dependable stone has been produced for generations are located within these two counties, a majority of them owned and operated by the Indiana Limestone Company.

Colors and Textures

The Indiana Limestone Company classifies its product by color-tone and texture and recommends the use of these terms to indicate the character of stone required.

Regular classifications are as follows:

Select Gray	Select Buff
Standard Gray	Standard Buff
Coarse Gray	Coarse Buff

Variegated

Special classifications are as follows:

Rustic Buff	Special Hard Gray
Old Gothic	Special Hard Buff

Buff Statuary Stock

Other specialties, ranging in color-tone from very light, almost a cream white, to distinctly dark, are also usually available, samples of which will be furnished by the Company upon request. A general description of the various grades and recommendations as to their selection and employment is given below.

Architects should remember that the classification established by the former Indiana Limestone Quarrymen's Association which, with minor changes in the system of grading, was adopted by this company, is for their direct benefit and the protection of their clients in the specifying of Indiana Limestone.

"Select" Stock (Either Gray or Buff)—"Select" stock is the average finer grained stone. It is more uniform in color-tone and texture than standard and is finer in texture than is required for the average run of exterior work. "Select" stock is suitable for the finer class of exterior work in monumental buildings and especially for entrances and those portions of a building that are within ready range of vision, also for carving, interior work and other particular uses. The use of this grade is also recommended for carving, important entrance and other prominent features of commercial and various other types of buildings in which standard or the coarser textured grades are otherwise employed. "Select" stock as produced by the quarries may contain some fine streaks of crystalline calcite and minor variations in texture that do not impair the strength or appearance of the finished stone or that can be eliminated readily from appearing on the face of stonework in the finished building.

"Standard" Stock (Either Gray or Buff)—"Standard" stock is the average product of the quarries and constitutes the bulk of the total output. It is thoroughly sound stone, having some variation in color-tone and texture. It may contain some streaks of calcite or slightly coarse grained formation, but such variations in this grade are confined with reasonable limits in the grading of the quarry blocks that will usually make it impossible to determine in the finished work at a short distance any difference between the general appearance of this and "Select" stock. Stone of the "Standard" classification is suitable for all purposes in the regular run of building work.

"Coarse Stock" (Either Gray or Buff)—This stock is the average coarse grained stone having a greater variation in color-tone and texture than "Standard," somewhat shelly in formation and may contain some pit holes, but is not as variable, coarse or open in texture as "Rustic."

"Coarse" stock is suitable for large cornices and other boldly detailed work in the upper part of any building, the lower part of which is built of "Standard" or "Select." It is also recommended for the cut work, trim, etc., in combination with sawed ashlar of "Rustic" or "Old Gothic" stock.

"Variegated" Stock—The "Variegated" stone is an irregular mixture of the gray and buff produced from the blocks that are quarried where the buff and gray color-tones adjoin in the quarry, showing some variation in color-tone as well as in texture. Such material, when cut up for building purposes, will, in the finished work, produce pieces of each color-tone and a small percentage of stone with both color-tones in one piece. It is unusually effective in giving variety to plain surfaces and is a desirable class of material for trim as well as for wall facing.

"Variegated" stock will embrace stone that will range in texture from a fair grade "Standard" to "Select," and consequently will include some stone containing streaks of crystalline calcite and shelly formation that do not make the quarry blocks too coarse or variable to be used for the average run of cut stone work, trim, etc. The coarser grained and more variable of the "Variegated" stone is included in the "Old Gothic" Classification.

Where only a uniform fine grained selected grade of "Variegated" stock is desired, "Variegated Statuary Stock" may be specified. This is not a regular classification and is not included in price list or segregated in the stock piles. Stone of this character is usually available in moderate quantities, and will be furnished on special order only at a differential in price covering the cost of selecting the quantity required from the stacks.

"Rustic" Stock (Buff Only)—"Rustic" stock is the coarser grained stone, having an interesting, more or less open shelly texture, with a varying amount of crystalline calcite intermixed, some of which will have a decidedly coarse somewhat honeycomb formation; some of it is likely to be darker in color-tone, and some of it is quite hard, due to the size of grain and amount of calcite that it contains. It is therefore coarser and more distinctive in texture, showing a wider range of granular formation and more variation in color-tone than any other grade, except "Old Gothic."

This grade is particularly suitable for the sawed ashlar facing of walls, for which purpose it may be to advantage combined with trim of either "Variegated," "Standard," "Coarse" or "Select" stock. "Rustic" stock is not generally recommended in place of "Standard" or other grades for any portions of a building on which there is much molded work and cutting, on account of its texture and hardness and the consequent greater cost of cutting this kind of stock.

"Old Gothic" Stock—This class of stone is unselected as to color and texture, and embraces the gray, buff and variegated stone, which, although varying in texture from medium fine to distinctly coarse, will generally be of fairly coarse texture, containing shelly formation with both white or dark crystalline streaks, and streaks of calcite, shelly matter, crowfeet, etc., that do not affect the structural soundness of the stone. It has the widest range of variation in color-tone and texture and is recommended especially for all forms of rough-sawed masonry field work; range work, random ashlar, etc.

Buff Statuary Stock—This grade covers only the very fine uniform grain buff stock as produced by certain quarries in comparatively limited quantities. It is not a regular grade and is sold principally for sculpture and carved doorways, tracery, sculptured panels, memorials and elaborate interior work, for which purposes the higher cost of this stock is fully warranted. For all exterior work with the possible exception

Continued on next page

of occasional pieces of statuary, fine tracery or intricate carving, "Select" stock available at lower cost will be found eminently satisfactory.

"Special Hard" Stock (Either Gray or Buff)—"Special Hard Gray" and "Special Hard Buff" are especially adapted for base or grade courses, steps and platforms, buttresses, floor tiling, terrace paving, and other work that is subject to abrasion, or constant wear under foot traffic; for which purposes these special grades of stone are principally recommended. This class of stone is not recommended in place of the regular classes for the average run of work, such as ashlar, trim, etc.

Ease of Working

No other commercial stone is so easily worked as Indiana Limestone. In spite of its great strength it can be freely sawed, planed, turned and carved, and be otherwise worked by machinery, as well as by hand.

Physical Characteristics

Indiana Limestone is *non-crystalline*; the aggregate filler and matrix are all pure carbonate of lime.

Chemical Analysis (Average)

Carbonate of lime	97.23%
Carbonate of magnesia	1.20%
Silica	.74%
Alumina	.56%
Oxide of iron	.15%
Water and loss	.12%
	100.00%

Physical Data on Indiana Oölitic Limestone

Average weight (dry)	144 lb. per cu. ft.
Average absorption by weight	4.6%
Average crushing strength seasoned stone	from 6000 to 8000 lb. per sq. in.

It is not a hard or brittle stone, and can be cut with equal ease in any direction. For all practical purposes it is considered a free stone, having no evidence of cleavage plane. It possesses far greater strength than required for any ordinary building purpose, the seasoned stone having an average crushing strength as given above and a remarkably uniform modulus of rupture value, whether tested parallel to or at an angle with the grain, making it safe for long lintels, etc. It is unnecessary to set this stone on its natural quarry bed.

Indiana Limestone is to all intents and purposes fireproof. It calcines above 1500° F. and will not spall, crumble, split nor check at temperatures up to 1000° F. when drenched with cold water.

Possessing a wonderful internal elasticity, adapting itself without damage to extreme temperature changes and other conditions of permanence that exist in modern building structures, it is for this reason alone particularly well adapted to use both in building masonry and as a facing material in the colder northern sections of the United States and in Canada.

Permanence

Durability and resistance to atmospheric action is proved by the exposed quarry ledges that are centuries old and by many fine existing structures of considerable age. The soft light color-tones are permanent, and no other building material remains clean so long or better resists the accumulation of grime from the smoke-laden atmosphere of manufacturing cities.

Many fine monumental and commercial buildings in the South and in Canada may be referred to as attesting the beauty, adaptability, permanence and genuine value of this fine natural building stone under varied climatic conditions.

Finishes

Any hand-tooled, machine, or sawed finish, including rubbing and honing, may be applied, except bush hammering and other so called "hardstone" finishes which are used only infrequently for special purposes.

Additional information on finishes will be found in the service publications of the Company.

Uses

Indiana Limestone, to the extent of many millions of cubic feet, is used each year for all classes of buildings. A large proportion of the United States Government buildings have been built of this stone.

Many of the finest office buildings, banks, stores, and other commercial structures, churches, school and college buildings, residences, apartments, as well as monumental buildings of all sorts have been built of Indiana Limestone.

It is unsurpassed as a material for residence trim, and for the trim of schools, factories and industrial buildings of all types where it is used in walls of brick or other native stone.

The finer grades of Indiana Limestone are much used for interior work in churches, public buildings, fine residences, etc. The fine grained buff stone, when in place, can scarcely be distinguished from the caen stone of France; and having much greater strength and durability is conceded to be its superior.

The finest and most elaborate carved work, both interior and exterior, is easily, beautifully and permanently expressed in this material.

It is widely used for the larger kinds of architectural sculpture and statuary groups, gateways, pergolas and memorials with most gratifying effects. For such uses, the practically unlimited size of the perfect units which may be had is a great advantage. Monolithic columns, up to any size which can be transported, are always obtainable.

In addition to its regular use as cut stone for the various purposes already enumerated, it is also used in the rough-sawed form, for masonry facings, forming the field work of walls trimmed with cut stone, as described on the next page.

An example of this class of usage in church building is illustrated on the fourth following page.

In engineering, Indiana Limestone is extensively used where an architectural effect is desired for walls, piers, bridge abutments, etc., and especially for the balustrades and trim of bridges built of other masonry, or of reinforced concrete.

Literature and Samples

Literature useful to architects in the form of service publications, including technical information, construction details, service plates, etc., is constantly being prepared, and as published will be furnished gratis to those requesting it.

Samples of the stone will also be furnished to architects and others interested.

Data on anchorage, setting mortars, stain-prevention and cleaning, and other related subjects will be furnished on request.

Every architect should have on file a copy of the latest edition of the Indiana Limestone Specification Manual.

All architects should also obtain a copy of the new specifications for random ashlar masonry.

Rough-sawed Indiana Limestone

Rough-sawed Indiana Limestone in "Old Gothic" and Short-length "Variegated" or other classifications is one of the Company's more recent developments

Continued on next page

for the facing and building of moderate cost masonry walls.

The wall construction and facing schemes that are embraced within the class of random ashlar, range work, etc., as covered by this specification, are many and varied in detail and effect, and cover a wide field of usage in buildings of various types. These forms of stone-faced wall construction are especially adaptable for church, scholastic and institutional buildings of all kinds, as well as for residences, and, in fact, for all other classes of buildings for which a somewhat informal architectural style is considered most suitable.

The architect will find these forms of construction are decidedly economical and possess advantages that are worthy of careful study.

On account of the saving in labor that is afforded by the use of material already squared to the exact height and thickness of the different units required by the particular jointing scheme adopted, ashlar of this rough-sawed limestone will frequently be found less costly and more effective in the finished building than walls built of or faced with cheap local stone; especially so, as the facing units may be dimensioned to fit and bond with the brick or tile backing units; also by reason of the easy working qualities of Indiana Limestone, which make possible the breaking and trimming of the sawed stone strips to the proper lengths at a minimum of labor cost.

The Rough-sawed, "Old Gothic," "Variegated" and "Rustic" Indiana Limestone in strip form gives the architect a wider range of choice in the employment of stone for the facing of buildings, by filling the gap that has heretofore existed between the regular cut stone ashlar, on the one hand, and the rougher types of wall such as field stone or rubble work and other forms of rock-faced masonry, on the other. It also affords a means of using stone in an economical manner for buildings of moderate cost, for which any form of cut stone facing, however desirable, might be considered as involving an unwarranted increase in cost.

Send for Random Ashlar booklet and for further information and data address the Architects' Service Bureau at Bedford, P. O. Box 308.

Tribune Tower, Chicago, Ill.
JOHN M. HOWELLS and RAYMOND M. HOOD, Associated Architects

Preface to Standard Form of Cut Stone Specifications for Indiana Oolitic Limestone

For the convenience of architects and others using this specification, it has been prepared and published both in loose leaf typewritten form and in folder form, and *will be mailed free to architects on receipt of postal request.*

It is particularly important that the Company's bulletins in reference to setting mortar, sand for setting and pointing mortar, flashing and calking of projecting members, detailing of stone in connection with reinforced concrete and the protection of cut stone at time of delivery, during and after erection, also be carefully studied.

Note: It being more or less usual for cut stone to be furnished to the contractor either f.o.b. cars at destination or delivered alongside curb at the building site by trucks or teams, the specification is so arranged that either the setting only, or the delivery and setting, may be readily separated under an entirely separate "Setting Contract."

Specification for Cut Indiana Limestone

(1) Work Included—The work under this contract shall include all labor and material for the furnishing of cut stone work in accordance with the drawings and as hereinafter specified.

(2) Description of Stone—All Limestone specified or shown on drawings shall be ..... Indiana Oolitic Limestone building stock, free from all defects that would materially impair its strength, durability or appearance, and within the range of variation of color and texture represented by two samples approved by the architect.

Specially graded stone, acceptable as to hardness and color, as per samples to be submitted, shall be employed where indicated on drawings, for ..... and all other positions in contact with the soil or exposed to direct wear.

Wherever the terms "Indiana Limestone" or "Limestone" occur in this specification, they specifically refer to and shall imply "Indiana Oolitic Limestone" quarried in Lawrence or Monroe Counties, Indiana, all such stone to be from a quarry the product of which has been tested at the U. S. Bureau of Standards for physical properties and weathering with satisfactory results.

(3) Finish—The finish on exposed surfaces generally, except where tooling or carving is indicated, shall be smooth, machine-dressed, showing no tool marks.

(4) Samples—The contractor shall submit to the architect two samples which shall be typical of

Continued on next page

War Memorial, Southampton, L. I., N. Y.
Goodwillie & Moran, Architects
One of the many recent fine monuments constructed of Indiana Limestone

the extremes which the contractor proposes to furnish. Samples to be about 3½ in. wide by 7 in. long by about 1 in. thick, produced with the large faces cut across the grain of the stone, the finish specified to be indicated on the large faces and at least two of the edges to be rock-face. Similar samples shall be provided when "Special Hard" stone or any other grade of stock is specified for certain positions in the building.

All samples shall be labeled or otherwise clearly marked with the grade of the Limestone, the name of the contractor submitting them, and with the statement: "Samples of Indiana Limestone to be furnished for the ..... Building."

(5) Standard Practice—The standard practice established by the former Indiana Limestone Quarrymen's Association of Bedford, Indiana, shall govern, except where this is in direct conflict with the specific intent of the architect's detail drawings. Bidders not familiar with these standards relating to grading, cutting, setting and anchorage practice, etc., are cautioned to inform themselves regarding them.

The architect reserves the right to approve the sub-contractors for both the cutting and setting of the stone, before this portion of the work is awarded.

(6) Cutting and Setting Drawings—The cut stone contractor shall prepare and submit to the architect for approval, complete cutting and setting drawings, in triplicate, for all of the Limestone work under this contract and no stone shall be cut until these drawings are approved by the architect. Such drawings shall show in detail the sizes, sections and dimensions of stone, the arrangement of joints and bonding, anchoring and other necessary details.

These drawings shall be based upon and follow the drawings and full size details prepared by the architect, except where it is agreed in writing that changes be made. Each stone indicated on these drawings shall bear the corresponding number marked on the back or bed with a non-staining paint.

(7) Bonding and Anchorage—All projecting stones, except where otherwise shown as anchored to the structure, and so provided for by details on setting drawings, shall have beds in the wall at least 1 in. greater in depth than their maximum projection.

Moulded projecting courses, unless shown as secured by suitable anchorage or steel supports, shall have not less than four-sevenths (4/7) of their cubic contents inside the face of wall. There shall be "through" or bond stones wherever indicated on approved cut stone drawings.

Provision for the proper anchoring, doweling and cramping of work in keeping with standard practices, also for the support of stone by shelf angles and loose steel, etc., when required, shall be clearly indicated on the setting drawings.

(8) Details for Lintels, etc.—Lintels, architraves and other members spanning openings, whether supporting a superimposed load or only their own weight, shall be of the proportions and sectional area that will provide an ample factor of safety based on the average ultimate breaking strength of the stone specified.

(9) Carving and Models—All carving shall be done under this contract by skilled carvers in a correct and artistic manner, in strict accordance with the spirit and intent of the architect's sketches, or from plaster models provided or approved by the architect.

All carving to be executed.....

Contractor shall include in his estimate the sum of..... to be expended by the architect for the models that are required.

(10) Cutting—All stone shall be cut accurately to shape and dimensions and full to the square, with jointing as shown on approved "cutting and setting" drawings. All exposed faces shall be cut true. Beds and all joints shall be dressed straight and at right angles to the face, unless otherwise shown, and except where otherwise shown or noted on drawings the joints shall have a uniform thickness of ¼ in.

The patching or hiding of defects will not be permitted.

Washes shall be as deep as practicable and drips of sufficient width and depth to shed water shall be provided on all projecting stones and courses.

Raglets for flashing, etc., shall be cut in the stone where so indicated on the drawings.

Moulded work shall be carefully executed from full size details, supplied by the architect, and must match perfectly at joints. All arrises shall be sharp and true.

Quoins, pier and pilaster stone shall be checked at back as indicated.

All columns shall be accurately cut with the entasis shown on drawings. All pilasters to be cut straight without entasis or taper.

(11) Back Checking and Fitting to Structural Frame—Stone coming in contact with structural work shall be back-checked as indicated on the general drawings, and where shown resting on structural work shall have beds shaped to fit the supports.

(12) Lewis Holes and Cutting for Dowels, Anchors, Cramps, etc.—Holes and sinkages shall be cut in stones for all anchors, cramps, dowels, etc., called for under this specification or indicated on the "cutting and setting drawings."

Lewis holes shall be cut in all stones weighing more than 100 lb. No lewis or other holes shall be cut in exposed washes or come closer than 2 in. to the exposed face of the stone.

(13) Cutting and Drilling for Other Trades—This contractor shall do all cutting and drilling of stone for electric conduits, piping, leaders, etc., required for the installation of the work of other trades, as shown on the details for cut stone work.

(14) Field Cutting—Specify in detail any field cutting that will be required.

(15) Loading and Shipment—The Cut Indiana Limestone shall be carefully packed for rail or wagon transportation, with exercise of all reasonable and customary precautions against damage in transit.

All cut stone under this contract shall be delivered promptly as ordered and in the sequence in which it is to be set.

Setting Cut Stone

(16) Work Included—Contractor shall refer to the preceding specification for Cut Indiana Limestone for more detailed information regarding the cut stone that is to be set under this contract; also refer to "General Masonry," "Sheet Metal Work," "Roofing" and "Carpentry" specifications for references to other work that must be executed in conjunction with this work.

Continued on next page

(17) Delivery and Storage—All Indiana Limestone delivered f.o.b. cars at destination under ..... contract shall be carefully unloaded and delivered to the building site.

The cut stone shall be handled throughout by competent workmen and by such methods as will guard against soiling, mutilation or snipping in transit to and upon delivery at the building site.

The stone shall be stored at the building site on planking set so that the stone will rest entirely clear of the ground, and be protected by proper means from damage to arrises and from contact with anything which would result in the accumulation of dirt, dust, soot, mud, grease and other staining or disfiguring elements. The stone shall be covered with tarpaulin, stout non-staining paper or boards during extended periods of storage at destination or building site.

(18) Setting Mortar—All Indiana Limestone shall be set in a carefully prepared non-staining mortar. (See Alternate Mortar Clauses ("a"), ("b") and ("c") which follow.)

Note: The following three alternate setting mortar clauses; one for a cement mortar, one for a 50-50 mortar and one for a lime mortar, any one of which may be used according to conditions which make each one the more appropriate for the particular piece of work. The lime mortar clause is recommended principally for what may be referred to as all lime mortar masonry jobs in which that type of mortar is to be used for laying up backing as well as for setting stone facing.

The 50-50 mortar clause is recommended both for setting of stone in masonry walls where another type of mortar is to be used in laying up backing, and for light walls in which it can be used both for setting the stone and laying up backing.

The cement mortar clause is always to be recommended for both setting and parging the back of stone, where a cement mortar made of ordinary cement, either Portland or brick masons of any questionable kind, is to be used in backing masonry and especially for the enclosure walls of skeleton frame structures where both a strong mortar is desirable and where a dense reasonably impervious mortar that will protect the stone where it is built in place against concrete column and beam construction or fireproofing is all important. For that reason preference is usually given to use of a cement of the non-staining type either containing or mixed with a suitable integral waterproofing, as the most practical and effective means of protecting stone from staining effects of moisture coming through from backing or structural work in back of limestone facing.

(a) Cement Mortar—All Indiana Limestone shall be set in a carefully prepared non-staining mortar composed of 1 part of approved brand of non-staining cement, to 3 parts of sharp, clean washed sand, with the addition of ⅛ part of hydrated lime.

(b) Cement-Lime Mortar—All Indiana Limestone shall be set in a carefully prepared non-staining mortar composed of ½ part of approved brand of non-staining cement, ½ part of hydrated lime or lump lime paste to not over 3 parts sharp, clean washed sand.

(c) Lime Mortar—All Indiana Limestone shall be set in a carefully prepared non-staining mortar composed of 1 part of hydrated lime or lump lime paste, to not over 3 parts sharp, clean washed sand with the addition of non-staining cement in an amount equal to at least 15% by volume of the lime used.

When lump lime is to be used, paste shall be made from the best quality of freshly burned lump lime, slaked with cold water and screened through a ⅛-in. mesh screen into a settling box, following the practice employed in preparing lime for plastering. Lime putty thus prepared shall stand in settling box not less than one week and then be mixed with sand and properly stacked to age; cement to be added and thoroughly worked into mixture in small batches just prior to its use for setting of cut stone.

Note: The following clause will apply for all three types of mortar.

The sand must be *washed* entirely free from loam, silt, vegetable matter, salts and all other injurious substances, and shall be screened if containing pebbles or coarse grains that would interfere with the proper bedding and jointing of the work. The water shall not be alkaline and must be clear and devoid of salts and injurious elements.

(19) Scaffolding—The scaffolding required for the use of all trades, including scaffold for the proper execution of the cut stone work, will be furnished and erected by the masonry contractor.

(20) Centering—The wood centering required for the proper setting of cut stone work will be furnished and erected by the carpentry contractor.

(21) Anchors and Dowels—All anchors, cramps, Lewis anchors, etc., required by setting drawings or necessary for the proper erection of the work shall be included under stone setting contract. Except where otherwise specified, all anchors shall be of iron, thoroughly galvanized after they have been bent to shape.

Anchors for ashlar and face work generally shall be the standard ⅛ x 1-in. ashlar anchor or be of equivalent cross section, one anchor to each stone over ½ sq. ft. in area and at least two anchors to all stone over 2 ft. long or more than 3 sq. ft. in superficial area.

All dowels required for light stone work shall be made of standard heavy brass pipe of the size required.

(22) Grade Course—Where Limestone extends down to grade line, stonework above grade shall be protected by a properly installed layer of approved non-staining impervious material.

(23) Setting Cut Stone—The Indiana Limestone shall be set accurately in accordance with the requirements of the drawings. Before setting, all stone shall be *washed clean on all sides* and, if required, shall be scrubbed with fibre brushes using only soap powder and water and then be thoroughly rinsed with clean water. Just prior to setting, all stone shall again be sponged or drenched on all sides with clean water.

All stone shall be properly set, by competent stonesetters, true to line and level, with full flushed joints, filling all anchor holes.

All beds and vertical joints shall be ¼ in. in width, except where otherwise indicated. Wood wedges may be used only where necessary to prevent the crushing of mortar under heavy blocks, and shall be thoroughly soaked before use.

Mortar shall be raked out ¾ in. from the face of the stone to allow for pointing; excepting for such parts of the work as may best have the joints pointed or grouted full as set. The stone as set shall be sponged off along all joints.

Steps shall be set with a slight pitch to the front.

The ends only of lugged sills shall be bedded with mortar, balance of joint to be left open until pointed.

Heavy stone or projecting courses shall not be set until the mortar in courses underneath has hardened, all projecting stone to be securely propped until the wall above them is built.

All cornices, copings and projecting belt courses and all stones forming gutters, etc., shall be set with the vertical joints unfilled. The exterior profile of these joints shall then be caulked with rope yarn or picked oakum and be filled solid from above with a mortar grout composed of 1 part non-staining cement and 1 part fine white sand, mixed in small quantities, and of as thick a consistency as can be poured into the joints. Grout shall be stirred vigorously until used.

Splashing exposed faces of stone with mortar shall be avoided, and any splashings be immediately removed with a clean sponge and water.

(24) Parging and Backing Up—The backs of all stones and the sides of bonding stones shall be parged with the setting mortar not less than ½ in. thick before backing is built. *The first course of brick backing in direct contact with stone shall also be laid with the setting mortar.* Where the stone occurs as a facing applied direct to previously erected structural members, both back of stone and face of structural work shall be plastered with setting mortar and any space left

Twin Cities Plant, Ford Motor Company, St. Paul, Minn.
Albert Kahn, Architect
Interesting example of usage for Industrial Building

Continued on next page

to be grouted where this is required, to insure a thoroughly filled back-joint.

(25) Protection of Finished Work—Contractor setting cut stone shall co-operate with the carpentry contractor, who will furnish and erect the necessary protection for sills and all projecting stonework. All steps and platforms shall be protected with boards during the entire period of construction.

(26) Replacement of Damaged Stone—No defective stone, and no broken, spalled, patched or otherwise damaged stone shall be set without first obtaining the architect's approval. All damaged stone shall be recut or repaired, if approved, or be replaced by the contractor free of cost to the owner.

(27) Pointing—All face joints shall be raked and brushed out clean to a depth of at least ½ in., carefully removing any wedges and loose mortar so that pointing will be continuous, and after a thorough wetting of the stone the joints shall be pointed flush with mortar consisting of 1 part non-staining cement, 2 parts clean white sand and sufficient cold lime putty to make as stiff a mixture as can be worked.

(28) Cleaning—The face of all stonework under this contract shall be properly cleaned down upon completion; if necessary, this cleaning shall be done by scrubbing with soap powder boiled in clean water, applied vigorously with stiff fibre brushes, adding clean, sharp, fine, white sand to the soap and water mixture, drenching all exposed surfaces of stone with clear water after cleaning.

The use of wire brushes or acids of any kind will not be permitted under any circumstances for cleaning the stonework.

Specification for Random Ashlar Wall Facing of either Sawed-finish "Old Gothic" or Short-length Indiana Limestone (Note A)

All exterior wall facing, except cut stone trim which is elsewhere provided for under the heading of "Cut Stone Work," shall be of ["Old Gothic"] ["Variegated"] Indiana Limestone, laid up in random ashlar, using the stone of varying textures, sawed on four sides in the several heights required to lay up the work as indicated on the (detail) drawings, with the finish as it comes from the saw. (Notes B and C.)

This facing shall be bonded to the backing as shown, having at least one bonding stone 4 in. thicker than facing to each (Note D) ..... sq. ft. of wall, and the units shall be arranged to bond properly with the cut stone quoining at corners, window jambs, etc., and to fit in generally with the bonding scheme of cut stone trim throughout.

All stone for this purpose shall have faces square and be sawed from blocks having a length of not less than 3 ft. 6 in., and shall be broken up and jointed on the job to sizes required (Note E). All stone shall be set with level beds, shoving each block on to a full bed of mortar. End joints shall be (*vertical*) and be properly staggered, and shall be worked off square with face of stone (Note F). All joints shall be ..... thick (Notes G and H), weathered joints well filled with setting mortar struck full to the face of stone as the blocks are set, and each block shall be carefully backplastered with a thick coat of the same mortar as that used for setting.

All mortar droppings adhering to stone shall be immediately removed and the face of stone along all joints be sponged off clean as the work is set.

The specification for setting mortar and for backing up of stone should follow (Note I).

Explanatory Notes—

Note A—This specification should preferably be included under a separate heading of its own, as given above, or be made a part of the general masonry specification, under such a subheading, so as not to form a part of or be confused with the specification for cut stonework.

Note B—This Sawed-four-side, "Old Gothic" or "Variegated" may also be used where a rock face random ashlar is required. In such cases, for a 4-in. thick ashlar facing, the stone would be sawed to a thickness of 10, 11, 12 in., or more, according to the amount of rock required on face, and then be split apart on the job giving two rock-faced slabs with sawed beds and backs. After strips have been jointed off to required lengths, the rock-face is pitched off to a line parallel with back.

Or, as an alternate, sawed slabs may be used for rock-face work, involving a little more labor at the building but costing less than Sawed-four-side material f.o.b. the quarry.

Note C—Where the desired design has not been fairly well indicated on the drawings, it is advisable to add the following clause to the first paragraph:

"The length of Random Ashlar units generally shall not be less than one and one-half times their height" (except for closures and except where a long effect is desired) "nor more than three and one-half times their height."

Note D—The requirement for bond stones will vary somewhat with the ashlar design and unit height of units employed, and a small section of the wall should be carefully detailed to determine this. These units should generally be worked out in multiples of the brick or hollow tile backing units. Under usual conditions, one bond stone in from 8 to 12 sq. ft. of wall is considered sufficient.

Note E—The stone stock of any grade furnished under the Short-length classification will vary from 3 ft. 6 in. to 5 ft. 11 in. in length. Where greater length of stock is required the ashlar must be cut from full dimension quarry blocks, and the regular grade must be specified, as the Short-length classification will not apply.

Note F—This provides for the more regular and usual form of random ashlar. Where the irregular form with angular end joints is desired, omit word (*vertical*) and substitute either the words (*irregular*) or (*hammer broken*).

Note G—It is not practicable nor desirable to require joints less than ⅜ in. thick for wall facing of this rough-sawed material, and this thickness is recommended as the minimum, ½-in. joints to be specified for the ordinary run of work. For rock-face work or where a rougher effect is desired, a wider joint than ½-in. is often preferable. For rough, irregular work, where end joints are not vertical but are pitched off at an angle with the bed, fairly wide joints should be specified. It is not intended that joints be raked out and pointed later but that work be laid by masons with a full joint struck off flush, or weathered, at the time of setting.

Note H—A struck weathered joint, finished as the stone is set and requiring no pointing up later on, is specified, as it is considered the most appropriate type of mortar joint for this character of stone work.

As an alternate to this, especially when the joints are not very wide and it is considered advisable to accent them, a slightly raked out joint may be specified. For a raked joint, especially if wide, an unusually stiff mortar is sometimes necessary.

Note I—Where the use of a lime mortar is impracticable for any reason, a lime-cement or cement-lime mortar, made with a non-staining cement, should always be used.

Ordinary gray portland cement should not be used, because of its detrimental effect on any natural stone and on account of the frequently resultant staining of the limestone. A lime or lime-cement mortar, similar to that employed for cut stone work, is recommended for this work and for parging or immediate backing up of it.

Particular mention of careful backplastering in connection with the setting of all cut stone trim, should be made in the specification for that portion of the work.

SHAWNEE STONE COMPANY

SUCCESSOR TO THE CENTRAL OOLITIC STONE COMPANY

Indiana Limestone

CHICAGO OFFICE
2120-2140 South Kedzie Avenue
CHICAGO, ILL.

TELEPHONES
LAWNDALE 8940, 5490

QUARRY AND MILL: BLOOMINGTON, IND.
GENERAL OFFICES: Citizens' Trust Building, BLOOMINGTON, IND.

Quarry

Our production of Indiana Limestone this year 1928 will be in excess of 1,000,000 cu. ft. in grades and quantities about as follows:

Shawnee Select Manhattan Buff	58%
Shawnee Carrara	20%
Shawnee Oriental	5%
Shawnee Variegated	10%
Shawnee Rustic Buff	5%
Shawnee Travertine	2%

Our quarry is served by the great Illinois Central Railroad Co. This service, with the 1,000 ft. stacking tramway that we maintain, enables us to hold on hand in reserve at all times from 400,000 to 500,000 cu. ft. of stone, assuring architect and owner of the delivery and service they require.

Facilities

Our mill, located in the heart of the Indiana Limestone district, modernly equipped with electrically operated machinery of the latest approved type, offers excellent facilities for the prompt and efficient execution of contracts of any size.

Quality

The policy of this company is to see that no work leaves its mill not thoroughly executed in a workmanlike manner, and that the grade of stone is in accordance with the specifications and equal to approved sample submitted.

Samples

To interested parties and prospective buyers will be sent, express prepaid, on request, samples of ordinary size to any part of the United States or Canada.

Estimates

Requests for quotations on stone work are solicited and will be given prompt attention.

Co-operative Service

This company has an organization composed of men thoroughly experienced in their respective lines, and will gladly give information or render service to the architect, owner, and general contractor when called on. Prompt and satisfactory attention will be given to all inquiries and attractive quotations made at all times.

References

This company has executed the stone work for some of the prominent buildings of the country, and points with satisfaction and pride to its references. Some recently completed contracts follow:

Products

GENESEE VALLEY BLUE STONE, a New York State blue stone for architectural exterior and interior building construction.

NATURCLEFT FLAGGING.

For AMBLUCO Non-slip Treads, Landings, Flooring, Thresholds and Wall Base for interior and semi-interior uses, see pages A784-786.

Facilities

This company was organized and opened its first quarry in 1899, now having well developed quarries on its own property of about 200 acres located at Ambluco, Wyoming County, N. Y. The blue stone is taken out to a depth of 100 ft. from the top of the ground.

Mills and yards are equipped with the most modern machinery so that large volumes of business can be shipped without delay. This blue stone is handled by dealers in principal cities east of the Mississippi River. Samples are displayed with the Architects Samples Corporation, 101 Park Ave., New York.

Genesee Valley Blue Stone

Color and Texture—A distinctive uniform shade of light blue, blending well with adjacent light colored surfaces, or giving a sharp clean contrast with dark materials. It is of a fine grain and even texture, being made up mostly of pure hard quartz as shown below.

MINERALOGICALLY CONSIDERED

Fine hard sand, mostly quartz	70%
Clay, as binding material	28%
Water	2%

In this blue stone, quartz, the essential constituent, being harder than the accessory minerals, is pre-eminent on the wearing surface, which makes the stone slip-proof and very durable.

Strength, Weight and Fire Resistance—Few, if any, stones have a greater crushing and transverse strength than this blue stone. Likewise, the stone has high tensile and shearing strengths.

The following table gives its crushing strength, as compiled from tests made by the United States Ordnance Department:

CRUSHING STRENGTH

Rockport granite (Kidder's Hand Book)	17,750 lb. per sq. in.
Vermont marble	Average 13,500 lb. per sq. in.
Genesee Valley blue stone	19,970 lb. per sq. in.

Although of great density it weighs only approximately 150 lb. per cu. ft. when cut ready to set.

It offers great resistance to extreme heat, and the dielectric strength test is among the highest of all natural stones.

Durability—Specimens of this blue stone have been critically and carefully analyzed by eminent mineralogists and pronounced one of the most durable of all stones. In abrasive tests it excels most other stones. Like all stones, it should be cut to set on its natural bed.

It is said by one who has been in the business all of his life and who has made careful study of the stone edifices in Europe, that this Genesee Valley Blue Stone is very much the same as the stone in the architecturally famous stairway of the court in the Bargello Palace, Florence, Italy.

CHEMICAL ANALYSIS

Silica	76.50%
Alumina	14.75%
Oxide of iron	6.35%
Water	2.00%
	99.60%

Adaptability—This blue stone has substantially all the good qualifications of the old genuine North River blue stone which has practically been out of the market since 1912, and has several advantages over such blue stones of the reedy rock character. Genesee Valley Blue Stone is a liver rock and does not produce natural split flagging and curbing. The sheets of stone in these AMBLUCO quarries, being of unusually low levels, represent early deposits and are, therefore, much harder and more compact than stone quarried from higher levels. The quarry blocks are from 2 to 4 ft. thick, permitting ashlar and base courses to be set on the natural bed with face against the grain, which condition rarely or never exists with other blue stones.

Cutter and Sawed Face Ashlar

Even more artistically effective than seam face granite, cutter face (vertical seam face) blue stone ashlar has been worked into buildings of the early American farm house and English Tudor styles. The cutter faces are permanently and beautifully stained many colors and soft shades, producing an old tapestry design when laid random. Also the combination of sand sawed and shot sawed faces furnishes a pleasing relief from the smooth planed and rubbed finishes.

Foundation Beds, etc.

Genesee Valley Blue Stone is unexcelled for engine, motor, pump, etc., foundation caps. It is also especially good for shelves and uprights of underground vaults. Garden seats and sundials are frequently made of it.

Specification Suggestions for Exterior Use

It is essential that Genesee Valley Blue Stone be specified, and better to guard against the substitution of inferior blue stones, mention this company's name and address as producers.

Specifications should require all blue stone (as well as most other stones) to be thoroughly seasoned and to be cut so as to set on its natural bed, especially when used for grade courses.

The practical finishes, in order of their costs are: Sand sawed; shot sawed; rock face; wet sand rubbed; fine axed (6-cut); horizontally (machined) tooled; and vertically (hand) tooled. This blue stone also takes most any finish applied to a natural stone. The sand sawed finish, showing no saw marks, is very uniform and brings out the character of the stone. This is produced by a slow process and does not burn or bruise the surface of a stone as does planing and axing.

Naturcleft Flagging

A natural split flagstone of delightful range in colors not produced but sold by us. Specify AMERICAN BLUE STONE COMPANY'S Naturcleft Flagstone.

Co-operative Service

Our organization, through its members' lifelong experience with blue stone, offers its knowledge in an impartial manner, unbiased by thought of personal profit.

THE BRIAR HILL STONE CO.

Producers of Golden Buff and Variegated Sandstone

GLENMONT, OHIO

Briar Hill Golden Tone Sandstone

Briar Hill Golden Tone Sandstone—rough blocks, semi-finished, ashlar, stone-brick or cut and carved ready to set in accordance with plans and specifications.

BRIAR HILL GOLDEN TONE SANDSTONE
TRADE-MARK

Readily available in practically every locality.

Varieties—Golden Buff, Light Variegated and Dark Variegated, or in any desired combination.

A wonderful range of colors, all tinged with a beautiful subdued golden tone.

Use color, too, when you build with stone.

Adaptability—Suitable for all classes of buildings, both for interiors and exteriors; effective as trim for seam face granite, field stone, brick or stucco, and especially adapted to gothic architecture, because of its easy working qualities.

Durability—Briar Hill Sandstone is permanent in texture and color. Positive proof of this is offered by an old church at Glenmont, cornerstone of which is illustrated below. Built of stone from this quarry in 1857, the original tool marks remain clean cut and sound. Age merely mellows the beauty of this colorful stone.

Physical and Chemical Properties—Results of physical and chemical analyses, compression, freezing and absorption tests gladly furnished on request.

Quarry—Our vast quarry holdings insure a practically unlimited supply of this stone. Production is 50% golden buff, 30% light variegated, 20% dark variegated. It can be furnished in any height for column drums, etc.

Facilities—Our quarry and mill are thoroughly equipped with modern machinery, capable of handling any size project. Prompt, efficient execution of contracts assured at all times.

Price—Although distinctive and yielding infinite color resources to the architect's skill, Briar Hill Stone is reasonable in cost. It is, therefore, economically available for all classes of buildings.

Briar Hill Ashlar

THE wall shown above in actual colors is built of stone which is furnished in any desired heights and random lengths suitable for a number of different patterns in broken coursed ashlar, or straight coursed ashlar in varying heights.

While the wall pictured is of split faced ashlar, this material may also be obtained with sand or shot sawed face.

This stone is ready to set with very little additional labor by the mason on the job.

Write us for prices—you will be agreeably surprised.

Continued on next page

Briar Hill Stone Brick

Illustrated in actual colors on this page.

Cut to the size of ordinary face brick *or in random lengths varying from 6 inches to 36 inches*, this flexible building material combines the warmth and color of Briar Hill Sandstone with the ease and simplicity of laying of any standard building brick, and prices are very reasonable.

Bricks of Briar Hill Sandstone have high compressive strength, low moisture absorption, and can be laid with ordinary lime and portland cement mortar with absolutely no danger of staining.

Specials, such as paving brick sizes, or the long, thin slabs sometimes used in country house work, are also available at reasonable cost.

We solicit inquiries from architects and will be glad to work out special sizes or color combinations for out-of-the-ordinary projects.

Write for samples and prices in your locality.

Observe particularly, please, the cut stone trim of Briar Hill Sandstone, which has been tooled and sand-blasted to impart the mellow charm of primitive craftsmanship and incalculable age. A house of stone with this treatment has apparently weathered storms, sheltered and protected succeeding generations for centuries.

THE TAYLOR STONE COMPANY

Producers of Scioto Sandstone

McDERMOTT, OHIO

Scioto Sandstone

Scioto Sandstone is generally described as being a dense, fine-grained silica stone, possessing an unusually high compressive strength. Its widespread popularity for both exterior and interior construction insures a distribution that makes it readily available in practically every locality.

Scioto Sandstone ranges in color from a blue or pearly gray to a deep golden buff, the individual colors being designated as Blue, Gray, Buff and Tammany. The latter stone was so named because of the pronounced stripes which give it marvelous beauty.

Scioto Sandstone's durability is portrayed in some of the structures pictured here; the Cincinnati building, built in the eighteen seventies, was sandblasted in 1927 and revealed not a single flaw, or evidence of disintegration. At Buena Vista, Ohio, stands a house which was built in 1803. After 125 years, the rough hewn walls are in perfect condition, even the tool marks remaining sharp and clean.

Cincinnati-Covington Bridge, Cincinnati, Ohio

Scioto Sandstone production is assured for countless years to come, because of the well nigh inexhaustible supply in our great quarry. Every modern facility has been employed in our quarry, our enormous seventeen gang mill, and our finishing department, to assure our patrons quality workmanship and excellent service.

Scioto Sandstone, possessing many superior qualities, readily recognized and appreciated by the architect and builder, is nevertheless reasonable in price, whether furnished in the block, sawed, planed, or cut ready to set.

Chemical Analysis

Silica	88.5%
Alumina	5.9%
Oxide of Iron	1.7%
Moisture	2.1%

Public Library, Portsmouth, Ohio

Jewish Temple, Portsmouth, Ohio

Albany Avenue Bridge, Atlantic City, N. J.

Interior of St. Vincent's Church, New York, N. Y.

Courthouse, Calgary, Alta., Can.

Business Block, Cincinnati, Ohio

Adaptability and Advantages

Scioto Sandstone is adaptable to all types of architecture. It has long been recognized as a superior stone for bridge construction because of its great strength; that its warm tones produce an incomparable effect in interior construction, is evidenced by its selection for exclusive interior use in four of New York City's greatest cathedrals; because of its fine-grained denseness it produces the finest detail in intricate carvings; it is a highly desirable stone for general trim, and unusually attractive for random ashlar work.

Calcium — Magnesium — Oxide — Titanium Traces.

Crushing Strength—10,500 lb. per sq. in.

Specifications for Scioto Sandstone

This stone shall be of uniform texture and color throughout, and shall be free from rust streaks, checks or seams. It shall be a hard, dense, fine-grained silicious stone, comprising at least 86% silica, with not over 6% alumina content, and have a compressive strength of not less 10,000 lb. per sq. in.

To guard against inferior substitution, we respectfully suggest that, "Scioto Sandstone, produced by THE TAYLOR STONE COMPANY," be specified as the comparative standard.

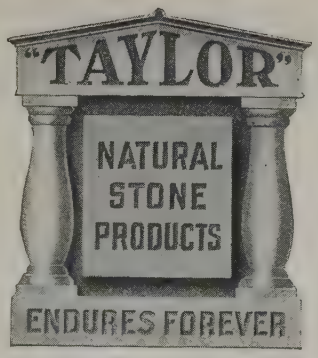
Special Products of Enduring Stone

These creations of our master designer are offered as being worthy of your earnest consideration in your efforts to choose those finishing touches so essential to maximum beauty in modern architecture.

Scioto Sandstone possesses those necessary qualities of rich texture, warm tones, great strength and durability, which are essential to pleasing effect and lasting satisfaction.

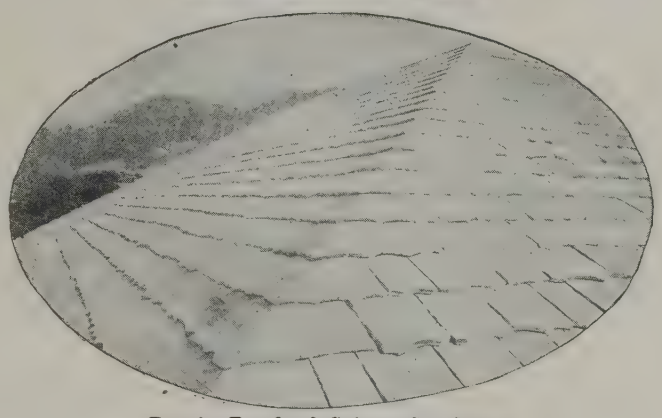


Distinctive Scioto Sandstone Rustic Roof

Nature's own crowning glory for the finer types of residential and public constructions. A trifle more expensive than other roofing materials, but worthy of the difference because of its greater beauty, individuality, and everlasting life. Unsolicited words of praise from prominent architects who have inspected Scioto Sandstone Roofs, indicate to us that in the development of this product, we have succeeded in filling a long felt need for a practical roofing material of unusual distinctiveness. Your discriminating clients seeking ultra exclusiveness will surely recognize the superiority of "Taylor" natural stone roofing.

Scioto Sandstone Roofing is furnished in slabs of a convenient size for handling, ½ to ¾ in. thick, with top and bottom surfaces sawed true.

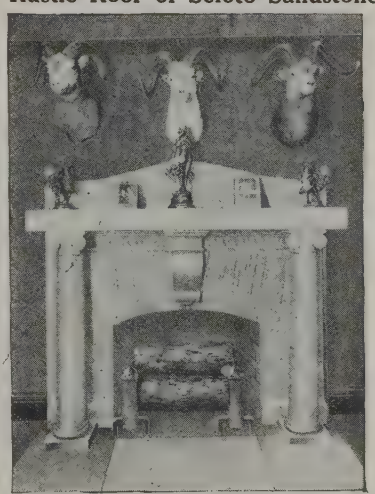
These slabs of beautiful blue, buff, gray, and tammany colors, may be easily scratched and broken to produce any dimension, and practically any desired effect.



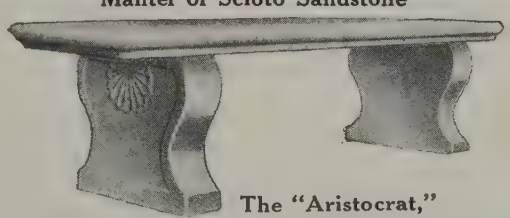
Rustic Roof of Scioto Sandstone

Garden Seats and Flagstones

Scioto Sandstone garden seats have met with instant approval wherever introduced. Although we have standardized on two designs that have proven the most popular, we can promptly furnish seats of any design. Our *"Natural Surface"* flagstone in rich but harmonizing colors of blue and buff, is particularly adaptable to rustic settings, while our sawed surface flagstone lends itself with pleasing effect to more formal surroundings. The proper complement of "Taylor" seats and flagstone walks will enhance the beauty of the most magnificent garden.



Mantel of Scioto Sandstone



The "Aristocrat,"
Hand Carved Sandstone Garden Seat

Unmatchable Mantels of Scioto Sandstone

Nature was the artist who placed the beautiful stripes in our "Tammany" stone, thereby giving us an incomparable material for mantel construction. The stately mantel pictured here is one of our several standard designs, which have been developed to meet the taste of the most discriminating, and lend complete harmony to modern or periodic styles of interior decoration. "Tammany" stone is featured in our mantels, but we can furnish mantels in our blue, buff, or gray stone.

Floors of Scioto Sandstone

Ideal for solariums, corridors, vestibules, etc. Due to its dense fine-grained texture, it will dress down to a razor-hone finish and hold shellac or varnish better than wood. The harmonizing colors of buff, blue, gray and tammany may be incorporated in many attractive designs.

Catalogues

Individual catalogues covering in detail each of the products listed here, will be gladly mailed to you promptly upon receipt of your request. It will be a pleasure for us to furnish samples of Scioto Sandstone, give prompt quotations, and otherwise assist you in every way possible. Please consider us at your service.

Specialty Work

We are in position to promptly execute any special work not here referred to. Your inquiries will receive immediate attention.

GEORGE WASHINGTON STONE CORPORATION

Aquia Freestone—Quarries Opened 1685

WASHINGTON, D. C.

QUARRIES: AQUIA, VA. SAW-MILL: ALEXANDRIA, VA. CUT STONE PLANT: WASHINGTON, D. C.

Product

AQUIA FREESTONE, beautifully colored and warm toned for both exterior and interior use; Blocks, Slabs, or Cut and Carved, ready to set in accordance with plans and specifications.

Description

Aquia Freestone is an arkose sandstone of the lower cretaceous period with its matrix harder than its crystals. This makes it tough but not hard. It is easily carved with great precision to a hairline edge which it holds tenaciously. Being crystalline in structure it is not affected by frost. It is unaffected by atmospheric acids and it withstands seaside conditions. The deposit is a homogeneous mass, so blocks of *any size* can be obtained, the only limitation being that of transportability. *Aquia Stone* has warm pleasing qualities and blends beautifully with brick. It also makes an attractive trim for other stones. It makes beautiful stepping stones and flooring, which are non-slipping when wet, and some exquisite mantels have been made of it. Where it has been used in a semitropical climate it gives off no glare. It is primarily an exterior stone, but for interior use it gives a *warm* and inviting effect.

Color

Aquia Stone has the *charm* of *color*. It has a dull tan background with here and there patches of color ranging from cream to reddish-brown which take the form of clouds if cut with the bed but if cut across the bed, the color shows in wavy veinings. In some of it these veinings shorten into speckles. The colors are *warm* in tone, being rather Moorish in effect, and a mass of the stone gives an effect of *rare elegance* which, with age, mellows like an old painting.

Durability

Architects build for a lifetime—*Aquia* has proved to be good for many lifetimes. Hundreds of gravestones of this stone bearing dates in the seventeenth and eighteenth centuries are perfectly preserved and what severer test could be given any stone than to have a 4-in. slab exposed on five sides withstand the elements for over 200 years? We can show many a perfect arris on our stone after 150 years. At the quarry there are many century old pick-marks left by slaves on a quarry face over which a stream of water flows and they are no more obliterated than if they were put there yesterday. Frost, freezing and thawing have failed to obliterate these pick-marks. Our quarrying operations are carried on throughout the winter and we have had no losses through the freezing and bursting of the stone. When in 1856 the present heavy cast iron dome of the Capitol was to be placed on the old *Aquia Freestone* walls and foundation, which were originally designed to support only the former wooden dome which was copper sheathed, the Army Engineers called in to report on the safety thereof, stated that the stone was 75 times stronger than was necessary and much stronger than the stone under the domes and towers of certain European Cathedrals, including St. Peter's in Rome and St. Paul's in London. The stone comes from the oldest quarries in the country.

Facilities

Our quarry, mill and cut stone plant have ample capacity for the largest buildings. They are equipped with modern machinery and give prompt and efficient service.

Tests

Results gladly furnished on request.

Zenitherm, the Material and Its Uses

Zenitherm has all the dignity and massiveness, without the coldness, of stone. It has all of the convenience of wood since it can be nailed, sawed, drilled and screwed.

Zenitherm is made of a combination of selected wood fibre and highest quality calcined magnesium oxide. This is treated with a weatherproofing binder and subjected to hydraulic pressure in steel moulds. The pressure is maintained until the mass sets into a dense slab, which is not only highly fire resistant but is exceptionally low in absorption. It does not distort or shrink. The process is covered by patents and its production is under factory control. There is no substitute having the specific advantages of Zenitherm.

Qualities and Properties

Zenitherm is impervious to frost or any climatic conditions. Constant physical characteristics together with low thermal conductivity make Zenitherm preferable as a permanent material insuring comfort, beauty, durability, weather resistance and safety in its fireproof qualities.

Zenitherm becomes tougher with age. It wears better than many grades of marble. It is kept clean by washing with soap and water. Zenitherm is odorless and verminproof. It contains nothing to decay or rot. It costs less than stone. Zenitherm is usually installed by carpenters.

Uses

Zenitherm is used for interior or exterior walls, floors, fireplace facings, wainscot, arches, panels, sills, stair treads, risers, string, base, walks, et cetera.

Standard Colors

Zenitherm is made in 14 standard colors: natural buff, gold, pink, olive, drab, light grey, stone grey, light brown, dark brown, red, green, blue, black.

The fact that Zenitherm is available in different shades gives the architect ample opportunity to secure beautiful and permanent effects. Colors are obtained by pigments, *not dyes.*

Standard Sizes

Zenitherm is made in sixteen standard sizes. Other sizes can be furnished according to specifications. Prices on application. All wall material is ⅝ in. in thickness. Floor material ¾ in. Cove base measures 4¾ in. from top of base to finish floor. Straight plain base, any height desired. Stair treads 1¼ in. in thickness. Risers ¾ in. in thickness.

STANDARD SIZES

Width, in.	Length, in.	Width, in.	Length, in.	Width, in.	Length, in.	Width, in.	Length, in.
5½	5½	5½	47½	8½	23½	15½	15½
5½	11½	8½	8½	8½	47½	15½	17½
5½	17½	8½	11½	11½	11½	17½	23½
5½	23½	8½	15½	11½	17½	17½	47½

Standard Mouldings and Trim

Zenitherm standard mouldings are made for use in conjunction with Zenitherm Walls. There are twelve different designs available. Zenitherm mouldings and trim to match ashlar surfaces afford a wide range in style, and assure a finish correct in design and effective in treatment.

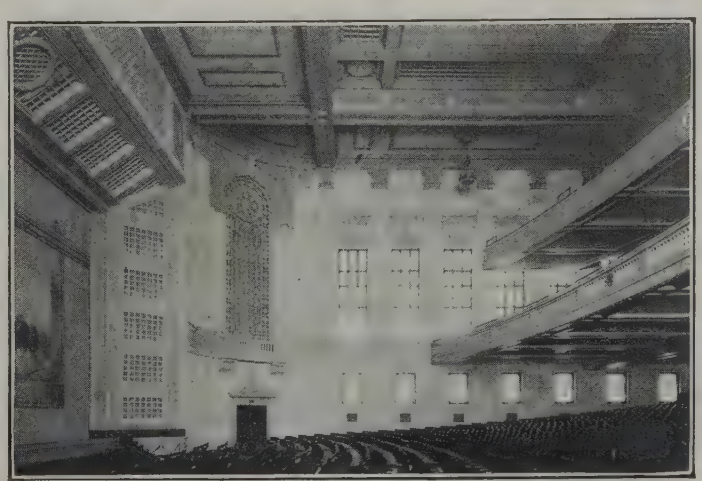
Corner Pieces

Zenitherm solid corners are manufactured to eliminate the appearance of joining and edge mitering. They carry out completely the effect of solid stone for columns, pilasters, beams, returns, reveals, quoins, et cetera. Where Zenitherm corner pieces are used, all edge mitering or joining is eliminated and installation costs are reduced to a minimum.

Installation

Zenitherm presents no difficulties of installation. The blocks, cut into standard sizes at the factory, are simply nailed with galvanized finishing nails to furring or brown coat of plaster or mortar for ashlar surfaces. Zenitherm Floors follow the standard methods of installing floor materials. Any competent carpenter can lay Zenitherm Floors and erect Zenitherm Walls if a reasonable amount of care is exercised.

Our "Contractors' Folder" gives full information and helpful suggestions to make the installation of Zenitherm a simple task. A copy furnished on application.



Zenitherm Walls, McFarlin Memorial Auditorium, Southern Methodist University, Dallas, Texas

Literature for Architects, Their Clients and Contractors

We have several booklets and folders available which we shall be glad to mail on request.

Included among these publications are "Zenitherm Walls"; "Zenitherm Floors"; "Contractors' Folder"; "Architects' Manual"; "Zenitherm Defined"; "Color Chart"; "Folio of Patterns"; "Folder of Mouldings."

Continued on next page

Specifications for the Proper Installation of Zenitherm

The following specifications are recommended for architects' use. They are designed to cover all possible uses of Zenitherm.

Specifications for Zenitherm Floors

Zenitherm Floor on Wood Underfloor—

(Include in Carpentry Specifications)

(1) Furnish and install in the following portions of the work, Zenitherm Floors as manufactured by the ZENITHERM COMPANY, INC., Newark, N. J., laid strictly in accordance with the following specifications and the manufacturer's directions.

Note: List here the portions of the work that are to have Zenitherm Floors and specify the sizes and colors of blocks to be used.

(2) ***Preparatory Work***—Before laying the Zenitherm Floors, this contractor shall see that all wood underfloors are level and true ¾ in. below the finish floor level; boards to be securely toe-nailed to prevent warpage. Any depressions in the floor are to be removed by the use of a skim coat of Zenitherm Bedding Compound and Zenitherm Blocks are to be laid immediately after this skim coat is applied. Wood underfloor on new work should be tongue and groove flooring not over 4 in. wide, driven tight, well nailed, true and level.

(3) When the underfloor has been properly prepared, Zenitherm Blocks, ¾ in. thick, shall be nailed directly to the underfloor. As the blocks are laid, butter edges of blocks with Zenitherm Pointing Compound and squeeze up tight, wiping immediately from the face any surplus compound that oozes out. Use 6d hot-dipped galvanized finishing nails, setting nails ⅛ in., and fill nail holes with Zenitherm Pointing Compound. (Use ⅛ in. skim coat of Zenitherm Bedding Compound for solidity.)

Zenitherm Floor on Concrete Underfloor—

(Include in Tile Work Specifications)

Note: Under the heading, "Concrete Work," provision should be made for leaving the concrete underfloors *level* and *true*, 1 in. below finish floor level. On new concrete work, top coat need only be screeded or floated to a level 1 in. below finish floor level. Troweled surface not needed or desirable.

(4) Furnish and install in the following portions of the work, Zenitherm Floors as manufactured by the ZENITHERM COMPANY, INC., Newark, N. J., laid strictly in accordance with the following specifications and the manufacturer's directions.

Note: List here the portions of the work that are to have Zenitherm Floors and specify the sizes of blocks and colors to be used.

(5) ***Preparatory Work***—This contractor shall inspect the portions of the work where the Zenitherm Floors are to be laid and see that the underfloor is level and true, 1 in. below the finish floor level. Any depressions are to be brought to proper level by the use of Zenitherm Bedding Compound.

(6) Over the level and true underfloor spread a ¼-in. thick layer of Zenitherm Bedding Compound as the blocks are laid. Butter the Zenitherm block on two edges with Zenitherm Pointing Compound and set block in position, taking care to keep the Compound off of the finished surface of the blocks. Allow finished floor a minimum of six hours for setting.

Note: Where large blocks are to be used (47½x5½ in., 47½x8½ in., 47½x17½ in., or 17½x23½ in.), paragraph 7 should be used, especially on such floors as those in department stores, where heavy trucks loaded with merchandise are used.

(7) In the following portions of the work, this contractor shall drill the concrete floor and insert hardwood dowels, two dowels for each Zenitherm Block. The blocks are to be nailed to these dowels with 6d hot-dipped galvanized finishing nails, setting nails ⅛ in. and filling nail holes with Zenitherm Pointing Compound. This nailing is in addition to the bedding, specified under paragraph 6.

(8) ***Border***—Zenitherm Border shall be laid in the same manner as specified for Zenitherm Floors, in the following portions of the work:

(Insert here the areas affected)

(9) ***Base***—Zenitherm Base, of the height indicated on drawings or specified herein, shall be set in the following portions of the work:

(Insert here the areas affected)

(10) Base shall be set in 47½ in. lengths, in blocks ¾ in. thick and secured to grounds with 6d galvanized finishing nails. Set nails ⅛ in. and fill nail holes with Zenitherm Pointing Compound.

(11) ***Stairs***—Zenitherm stair treads and risers (and strings) shall be laid as follows:

Note: On wood stairs, Zenitherm should be specified as above for Zenitherm Floors over wood underfloor. On concrete stairs, Zenitherm Treads should be specified exactly as for floors over concrete. On iron stairs, specify as follows: Insert toggle bolt through hole in iron step; countersink it and fill hole to surface of tread or riser with Zenitherm Pointing Compound. If it is possible to get under the stairs, drill hole through the iron and fasten with wood screw. Instead of using toggle bolts, where iron pan is sufficiently thick iron treads can also be drilled and pan or support tapped to receive screw-bolt.

Specifications for Zenitherm Walls

Zenitherm on Interior Walls—

(Include in Carpentry Specifications)

(12) Zenitherm Walls and wainscot shall be provided in the following portions of the work:

Note: If Zenitherm Floors have not been previously specified, paragraph 13 should be used instead of paragraph 12.

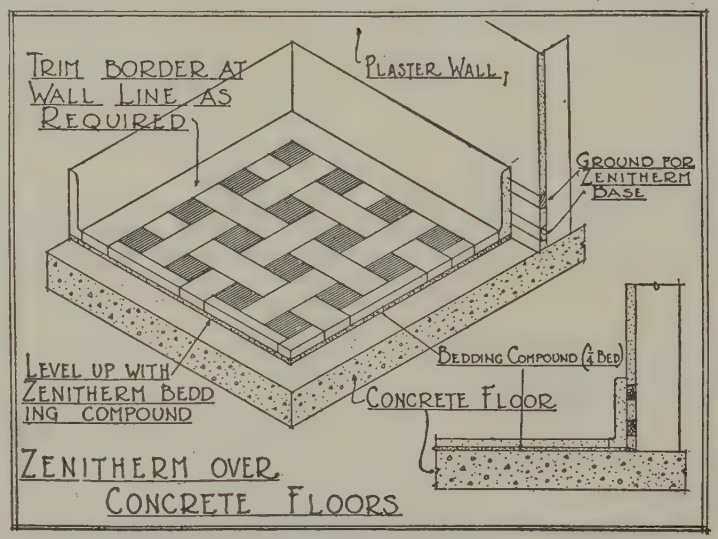
(13) Furnish and install in the following portions of the work, Zenitherm Walls (and wainscot) as manufactured by the ZENITHERM COMPANY INC., Newark, N. J., laid strictly in accordance with the following specifications and the manufacturer's directions:

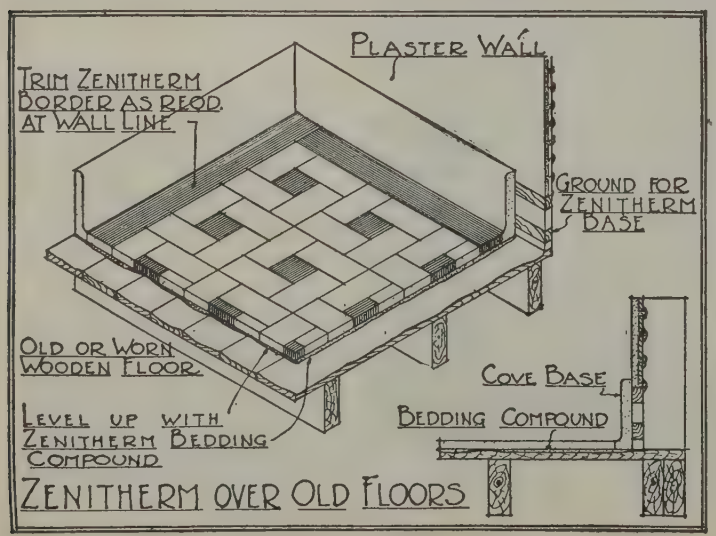
(Insert here the areas affected)

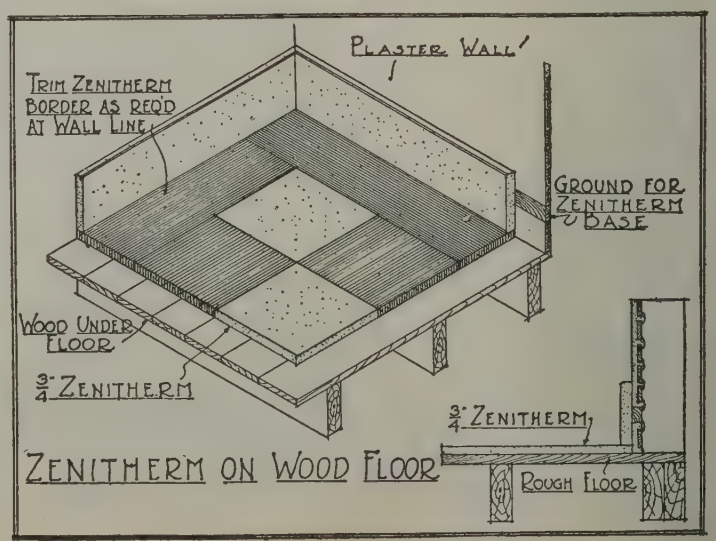
(14) Before applying the Zenitherm, this contractor shall see that all wall surfaces are true and plumb.

Note: Paragraph 15, 16 or 17 should be used, depending upon the type of joint desired.

(15) Zenitherm Blocks shall be ⅝ in. thick and have ⅛ in. (or ¼ in.) chamfered edges to form V joint when laid up close. All slabs shall be laid absolutely level and true.







Continued on next page

(16) Zenitherm Blocks shall be ⅝ in. thick and have straight and square edges and shall be laid absolutely level and true to form ⅛ in. (or ¼ in.) open joint. All joints shall be pointed with Zenitherm Pointing Compound.

(17) Zenitherm Blocks shall be ⅝ in. thick and have straight and square edges and shall be laid absolutely level and true with butt joints. All edges of block shall be buttered with Zenitherm Pointing Compound before setting the next block, all excess Compound being wiped from the face of the finished block.

(18) ***Bathrooms***—The wood backing around tubs and shower stalls shall be covered with a layer of heavy waterproof paper, applied like flashing at rim of tub or shower pan, and the Zenitherm nailed with 6d galvanized finishing nails driven at an angle, nails to be set ⅛ in. and the nail holes to be filled with Zenitherm Pointing Compound. Pointing Compound shall be buttered to fill along edges of blocks when erecting.

(19) On Concrete, Hollow Tile or Masonry Walls Using Furring—

Note: It is recommended, for the sake of economy, that wood nailing blocks be provided when the wall is erected, to which attach ⅞x3 in. furring strips.

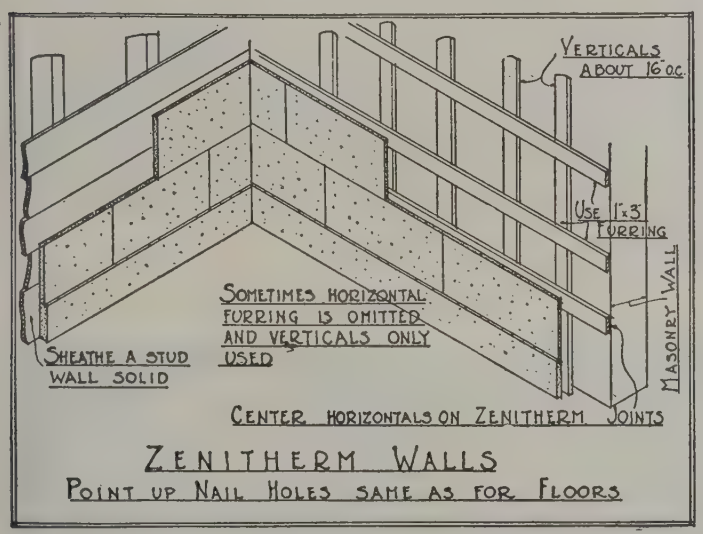
(20) Zenitherm Blocks shall be nailed to furring strips with 6d galvanized finishing nails as above specified.

(21) Center all horizontal joints of Zenitherm Ashlar on furring strips and, where double furring is used, center horizontal joints on horizontal furring strips.

Note: If close joint is specified, butter edges of slab with Zenitherm Pointing Compound. Point open joints as specified under paragraph 16.

(a) Alternate—Secure furring for Zenitherm with expansion bolts.

(b) Alternate—On hollow tile walls, secure vertical furring with toggle bolts about 18 in. on centers. Apply horizontal furring as above.



(22) On Cinder Nailing Block or Gypsum Block Walls, Without Furring—

Note: Under the heading, "Plastering," provision should be made for this contractor to apply a skim coat of haired brown coat of gypsum plaster or mortar sufficient to bring the wall plumb, true and straight, either ¾ in. or ⅝ in. behind base and cornice margin, depending on the thickness of the Zenitherm to be applied. Point nail holes as above.

(23) Zenitherm shall be face-nailed in the usual manner, the nails being driven at an angle directly into the supporting wall.

(24) On Brick, Concrete, Hollow Tile or Masonry Walls, Without Furring—

Note: Under the heading, "Plastering," provision should be made for this contractor to apply a minimum ¾ in. coat of haired brown coat of gypsum plaster or mortar, bringing wall perfectly true, plumb and straight, either ¾ in. or ⅝ in. behind base and cornice margin, depending on the thickness of the Zenitherm to be applied.

(25) Before applying the Zenitherm, this contractor shall see that brown coat of gypsum plaster or mortar is thoroughly set and dry, true, plumb and straight.

(26) Nail Zenitherm with hot-dipped galvanized finishing nails, driving nails through face of Zenitherm at an acute angle into the brown coat (Specify 3d nails for ¾ in. thick brown coat; 4d for brown coat thicker than ¾ in.) Use 4, 6 or 8 nails, according to size of block. Butter edges of Zenitherm Blocks while erecting, with Zenitherm Jointing Compound. Set nails ⅛ in.; point nail holes with Zenitherm Pointing Compound.

Zenitherm on Exterior Walls—

(Include in Carpentry Specifications)

(27) ***Frame Construction***—Cover sheathing with waterproof building paper, nail Zenitherm Blocks to sheathing with 6d galvanized finishing nails. Set nails ⅛ in. and fill holes with Zenitherm Pointing Compound.

Note: If close joint is specified, butter edge of block with Zenitherm Pointing Compound and squeeze into place before nailing, wiping off excess compound. Point open joints as specified under paragraph 16.

(28) ***Masonry Construction***—Nail ⅞x3 in. furring strips to wood plugs, or metal wall plugs, set in masonry wall. Nail Zenitherm Blocks to furring strips with 6d galvanized finishing nails, set nails ⅛ in. and fill holes with Zenitherm Pointing Compound. Center all vertical joints of ZenithermAshlar furring strips where single furring only is used. Center horizontal joints on horizontal furring strips where double furring is used.

Note: (a) If close joint is specified, butter edges of block with Zenitherm Pointing Compound. Point open joints as specified under frame construction.

(b) Alternate—Secure furring for Zenitherm with expansion bolts.

(c) Alternate—On hollow tile walls, secure furring with toggle bolts about 18 in. on centers vertically.

THE DECORATIVE STONE CO.

Producers of Cut Cast Stone

PLANT AND MAIN OFFICE

Chapel Street and Blatchley Avenue

NEW HAVEN, CONN.

NEW YORK OFFICE, 51 East 42nd Street

DEXTONE

TRADE-MARK

Product

DEXTONE—a cut cast stone of great strength and durability. Its individual characteristics make it an ideal stone, either for trim in conjunction with brick or rough stone, or for entire buildings. It has been extensively used in this manner for banks and other monumental buildings.

It is offered on the merit of its own individual good qualities and not as a cheap substitute for any other material.

Pioneer in Producing Cut Cast Stone

This company has been one of the pioneers in the development and scientific manufacturing of cut cast stone and is just proud of its twenty-five years of progressive growth. Good stone can only be produced where the thorough methods employed in its manufacture are carefully and conscientiously carried through. It requires special machinery and an organization with a thorough knowledge of the material to produce the finest stone.

METHODS USED IN PRODUCING DEXTONE

The Importance of Sizing and Proportioning of the Aggregates

In order to make a cast stone in which the aggregate will be uniformly distributed throughout its entire mass, it is necessary to separate the sizes and reproportion them so that the same amount of each size is used in each mix.

The illustration shows the various sizes of aggregate which are used in the manufacture of Dextone. A battery of electrically vibrated screens makes it possible to use the exact amount of each size necessary to form a uniformly dense mixture. By means of this scientific proportioning the voids are reduced to a minimum and the stone materially strengthened.

The use of crusher-run aggregate should never be permitted. Where crusher-run (ungraded) aggregates are used it is not possible to obtain the uniform density and hardness which is a characteristic of Dextone.

Note: A large percentage of dust (80 mesh and under) is found in all crusher-run aggregates. Manufacturers without screening facilities are, of course, unable to separate out this undesirable size. Its use will give a cast stone the dead, chalklike appearance common to all inferior grades of cast stone. It is one of the commonest causes of crazing.

Dextone Is Cast in Sand Moulds

By this method any excess water is immediately taken up in the sand, and within a few moments after casting, a mixture is in place in which the water content has been reduced to a minimum without having lost, until that time, its workability. This conforms in principle to the best practice recommended by the Portland Cement Association.

Importance of Water Control

Accurate control of the amount of water is an important factor in the production of a hard, dense stone. In the production of Dextone the water for each mix is automatically controlled thereby insuring the use of the correct amount. Note in the colored plates the perfect distribution of the aggregate as a result of this water control. This careful control is typical of the precise methods employed in the production of Dextone.

Two Weeks' Minimum for Curing

Too rapid drying out of unseasoned stone is another prevalent cause of loss of strength and crazing.

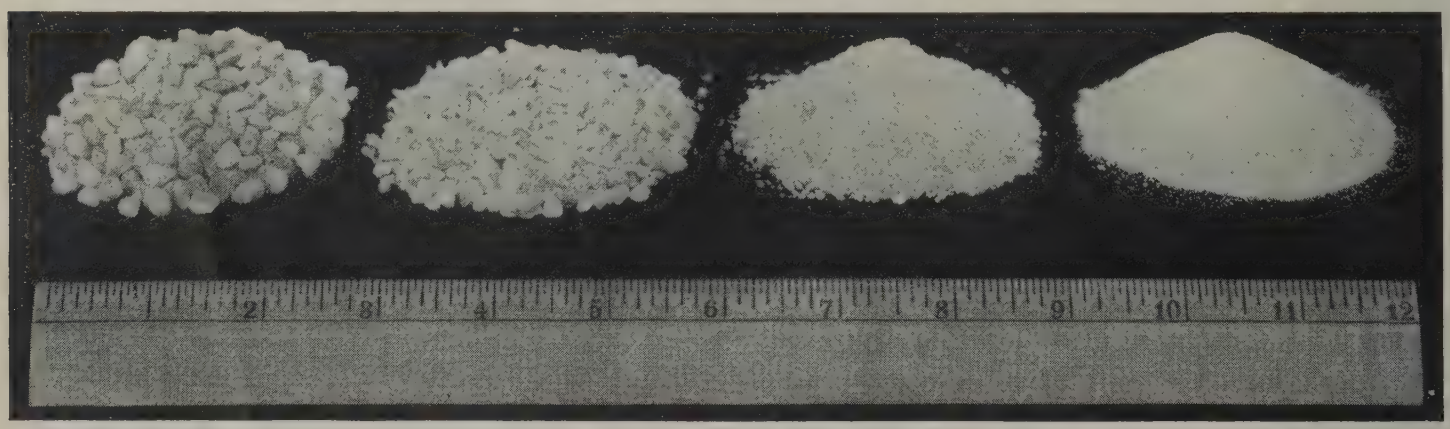

Fig. (1) Coarse
Suitable for mixtures where granite effect is desired. Stones in which this size is used show marked increase in strength.

Fig. (2) Standard
The body aggregate of all standard mixes, the smallest coarse aggregate allowable in any full strength cast stone

Fig. (3) Fine
A clean, sharp, fine aggregate which gives the mixture necessary workability. It is sized to close limits

Fig. (4) Dust
Worthless as an aggregate and unsuitable for any full-strength cast stone. None of this size is used in the composition of Dextone

CAST STONE SHOULD BE CUT AFTER CASTING

The Reason for Specifying and Requiring "Cut Cast Stone"

In order to make sure that all irregularities in the castings are removed, all stones are made not less than ¼ in. oversize and after a proper period of curing are then cut down to exact size and profile by carborundum planers. In so doing, the film of rich cement and fine aggregate, which always settles to the face of a cast and is one of the principal causes of hair cracking as found in ordinary cast stone, is removed. The dense solid aggregate of the stone is clearly exposed. Where this operation is performed, it becomes increasingly importtan that the aggregates which are thereby exposed be uniformly graded and show a uniform distribution on all faces. These two factors of aggregate selection and cutting from oversize castings are the two major elements of all good cut cast stone. Specifications must distinctly call for stone to be cast oversized and cut if the result shown in Fig. 1 is desired.

All Dextone Is First Cut to Finished Size by Machinery Before Applying Final Texture

The cutting of the stones from rough to finished size and exact profile is done by carborundum cutting planers and rubbing machines. This method, although more costly than other methods, is absolutely necessary in the production of high grade cut cast stone. Only by this process are the sharp arrises, true profile, exposure of the aggregate and other characteristics of cut cast stone obtained. *These same cutting operations are necessary regardless of the ultimate surface treatment.*

Cutting to finished size should be regarded as a manufacturing operation separate and distinct from the ultimate surface texture which it is desired to obtain. Architects should demand in their specifications that all stone should first be prepared in this manner. *This operation adds to the cost of production but it is of such importance that this additional cost should be considered a necessity and not a matter of choice.*

On cheaper grades of stone the finished texture is often executed without first removing the film which causes fine hair cracks to develop. The difference between the two finishes is readily recognized and should be given due consideration when comparing the cost of Dextone with other materials.

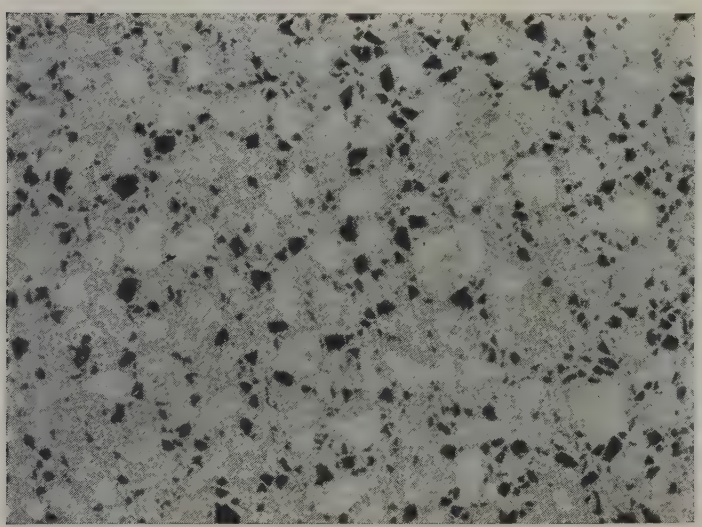

Fig. 1. Dextone with Aggregate Exposed by Machine Cutting
A representative piece of Dextone, from which ¼ in. of the cast surface has been cut. The lively, clean-cut, rocklike appearance of this stone is characteristic of a well-made cut cast stone. No cracks will develop in the surface of this stone

Fig. 2. Appearance of the Same Stone Before Cutting
A stone of the same mixture as Fig. 1, which has been finished by hand rubbing without removing the outside ¼ in. This surface will develop hair cracks common to poorer grades of cast stone

Some General Notes to Be Considered When Specifying Cut Cast Stone

We are frequently asked by architects to match some natural stone such as limestone or sandstone. It is a simple matter to match any color tone required but we do not recommend trying to match the texture by using fine aggregates only. Cut cast stone should be used according to its natural characteristics which require graded aggregates in certain proportions to produce the best stone. We discourage the efforts to match the nature of fine grain stones by requiring fine aggregates only. The resulting product does not conform to the high standard for which Dextone stands.

The essential points to cover in a specification for cut cast stone are as follows:

(1) Aggregates must be sized by screening and proportioned to produce maximum density. Crusher run aggregate not allowed.

(2) Must be made by the wet-poured process and in sand moulds.

(3) Stone must be of the same composition throughout and not faced.

(4) Mixed materials must be constantly agitated until placed.

(5) All stone must be made at least ¼ in. oversize on exposed surfaces, and then cut to correct size.

(6) Specify method of setting carefully as poor setting will ruin any stone job.

(7) Quotations to be based on Dextone Vermont White with hand bush-hammered finish, manufactured by The Decorative Stone Co., New Haven, Conn. (Substitute here other color or finish if desired.)

(8) All surface tooled finishes shall be applied after first being planer rubbed.

State amount added or deducted and name of manufacturer in case other make is estimated.

Note: In this specification no mention has been made of sand finish, acid treated, brushed, gothic or any other finish which cannot be properly classified as cut cast stone. *Buyers should be aware that these finishes are often sold in competition with cut cast stone.*

Continued on next page

RELATION OF TEXTURE AND FINISHES TO COST

Textures and Finishes

The following is a descriptive list of the finishes and textures in which cast stone is commonly supplied. Two major classifications are given: (1) Cut Cast Stone, (2) Uncut Cast Stone. Under the heading Cut Cast Stone, no mention is made of Sand Finish, Acid-Treated, Brushed, or any finish on which machine cutting from oversized castings is not done and, therefore, is not eligible for the designation Cut Cast Stone.

Cost

Following each finish, we have noted a figure representing its average relative cost on a percentage basis. The planer rubber finish has been adopted for this purpose as standard and given the value of 100%. This value is subject to variation according to the character and size of the building, but will undoubtedly serve in many cases where an approximate comparative figure is desired.

CUT CAST STONE—MACHINE CUT FINISHES

The finishes listed under this heading can only be produced where the facilities of carborundum planers, rubbing beds, etc. are available. All finishes produced in this manner are naturally more expensive than any of the finishes listed under the heading of Uncut Cast Stone.

Planer Rubbed (100%)

Under this classification all stone is cast not less than ¼ in. oversize and cut to correct profile by stone cutting machinery and with all machine marks eliminated. The full body aggregate of the stone is exposed and due to this cutting operation is permanently insured against crazing and other disfigurements. The irregularities in the castings are thereby eliminated and stones are cut to exact profile with beds and joints squared. It is a suitable finish for all purposes and for any class of building where a smooth finish is desired.

Honed (130%)

A subsequent operation to that of planer rubbing whereby all surfaces are smoothed with honing stones to give a semipolished effect.

As the difference between this finish and Planer Rubbed does not show up in a photograph, it is not illustrated.

Polished (180%)

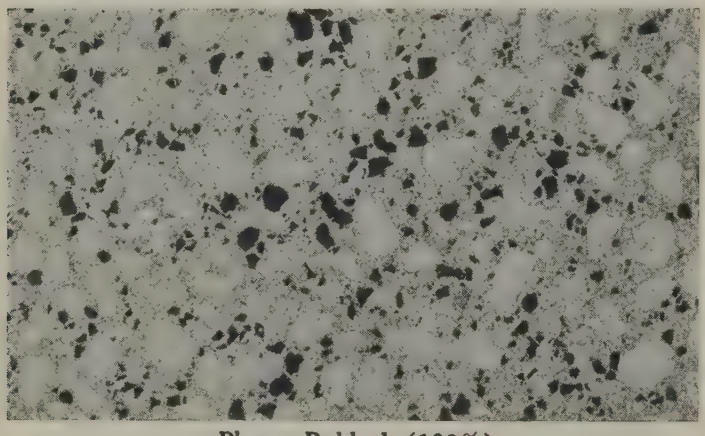
A subsequent operation to honing; the term is self-explanatory.

Machine Groove Tooled (105%)

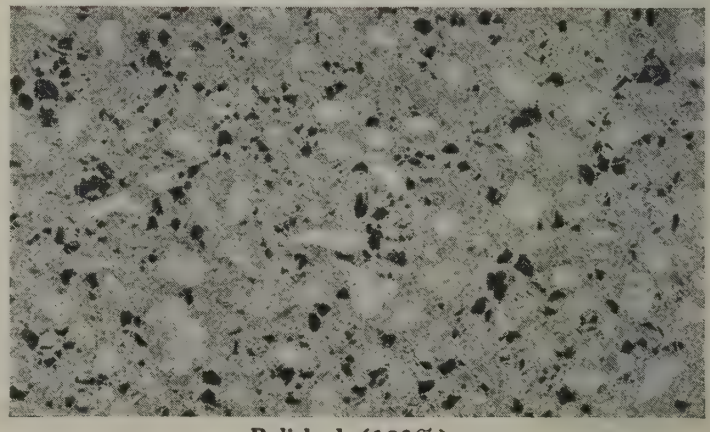
An operation similar to Planer Rubbed, except that on all vertical surfaces a series of regular evenly-spaced half-round grooves are cut. It is supplied in various widths of cutting.

Sawn (105%)

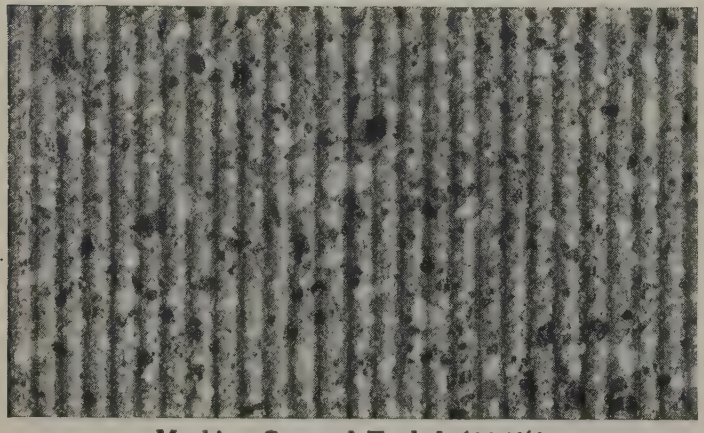
A surface texture produced during the operation of machine cutting whereby irregular random, saw-cut effects are produced, a desirable finish for ashlar field with textured surface.



Planer Rubbed (100%)



Polished (180%)



Machine Grooved Tooled (105%)

Sawn (105%)

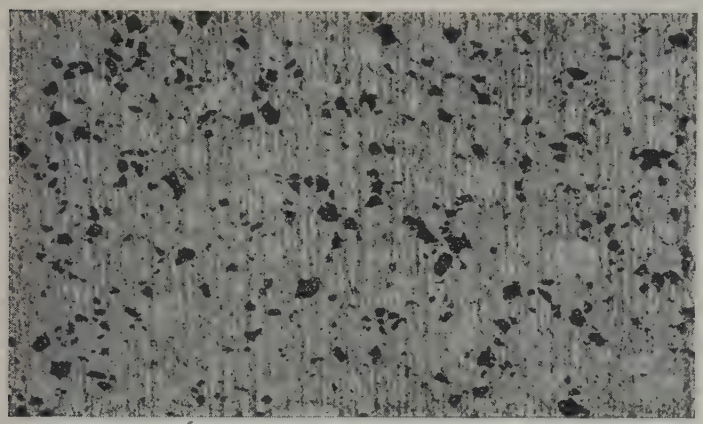
Continued on next page

CUT CAST STONE—HAND TOOLED FINISHES

All stones which are to receive hand-tooled texture are first prepared in the same manner as under Planer Rubbing.

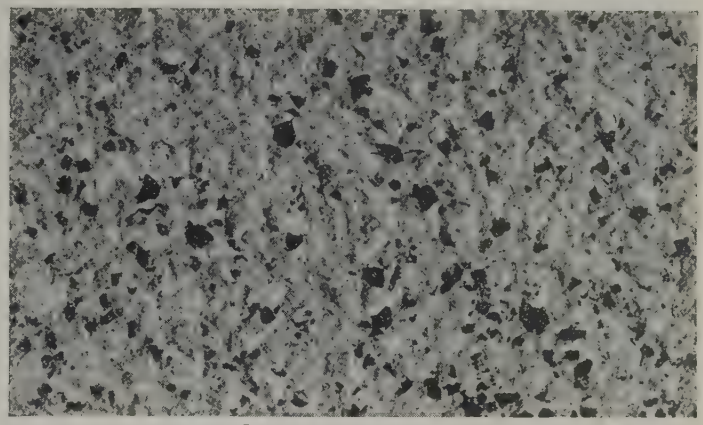
The tooling operations are merely for appearance and do not obviate the necessity of the preliminary cutting from oversized casts.

Bush-hammered, Crandalled, and other hand-cut finishes are frequently sold under those designations on which the preliminary operation of machine cutting has not been done. Finishes so produced are, of course, cheaper and do not possess the same qualities as Cut Cast Stone.



Bush Hammered (6 cut, 8 cut, etc.) (130%)

Done with a pneumatic hammer and showing a series of parallel vertical fractures. It is one of the finest finishes to be had in Cut Cast Stone

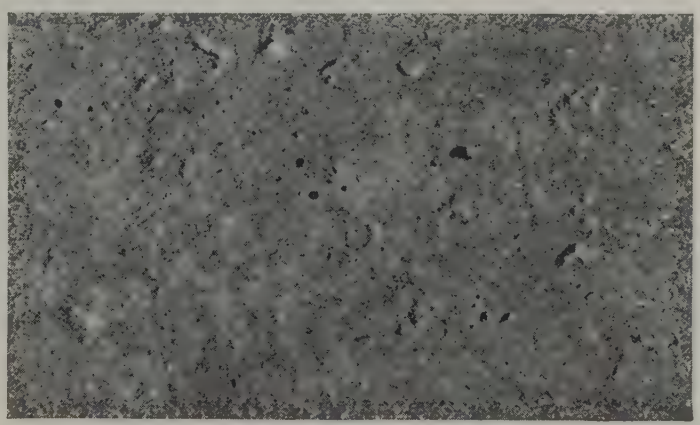


Crandalled (135%)

A coarse cutting showing no direction of tooled marks and more suitable for heavy members. This texture should not be used where fine detail is desired

Random Tooled (140%)

This finish and its application is illustrated on the second page following. It consists of intermingling various tooled textures, particularly suitable for English and Gothic style buildings where it is desired to emphasize the character of handwork.



"Old English" (120%)

"Old English" (120%)

This texture relates to none of the standard and accepted finishes. It is the most recent development of Dextone and is now being used to best advantage in conjunction with the modernistic style of architecture. It has new and unexpected advantages of color and a wide range of surface effects.

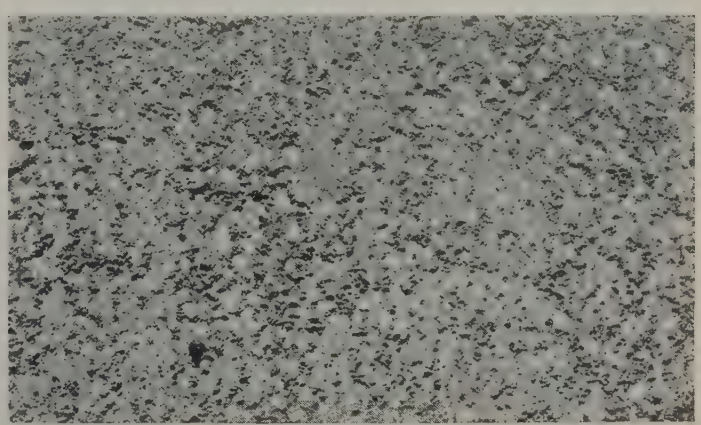
UNCUT CAST STONE

The finishes under this heading include Sand Finish, Gothic Finish, Sand Rubbed, etc. All are inferior to Cut Cast Stone finishes. Gothic and Sand Rub only are illustrated. We do not recommend these finishes and only furnish them if required.

Sand Finish (70%) is not illustrated as we do not recommend its use. It is listed here for reference only. It is cast in sand moulds and without surface finishing of any kind. Suitable only where appearance is of small importance and where greatest economy must be exercised. No demands of quality should be made of this finish.

Gothic Finish (75%)

To produce this, the surface of the "green stone" is brushed or roughened by other means thereby removing approximately $\frac{1}{16}$ in. of the rough cast surface. A comparatively small amount of aggregate is exposed. No machinery or equipment is required and it is, therefore, a cheaper finish suitable for work where fine sharp arrises and other qualities of cut stone work are not essential



Sand Rub (80%)

Produced in a similar manner to Gothic Finish except that the finished stone is somewhat smoother. It is an economical substitute for Planer cut stone. It has many varieties and is given various names by different manufacturers. It is the finish commonly supplied when the specification calls for Rubbed stone. It is, therefore, essential to specify Cut Cast Stone if the superior grade of the material is to be required

POINTS TO INVESTIGATE IN APPROVING CUT CAST STONE

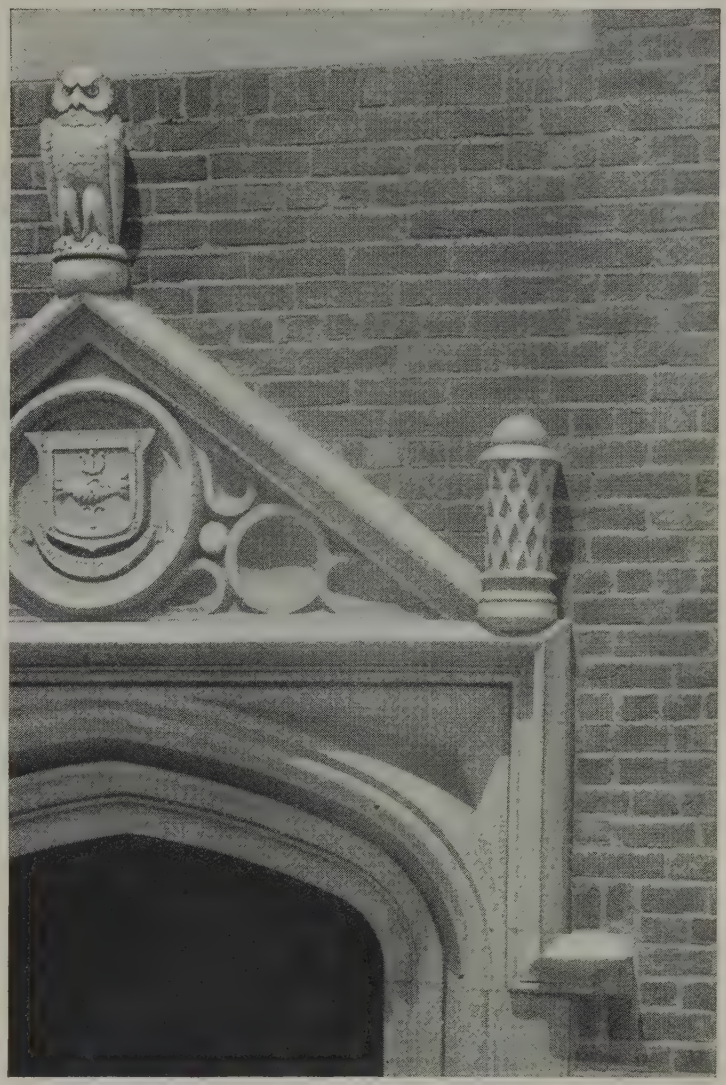
How to Buy Cut Cast stone

Architects are aware of the difficulties of enforcing the requirements of their specifications. This is frequently due to the use, in the specifications, of ambiguous terms.

(1) Make sure that all bids are based on the requirements of a specification which includes the recommended essential points. Do not permit alternates on cheaper finishes unless the specification specifically calls for them.

(2) Require that the concern from whom you are buying show evidence of plant equipped with screens, finishing machinery and all incidental equipment necessary in the production of Cut Cast Stone and can show representative work at least 10 years old.

(3) Many architects are now finding it to their advantage to take separate bids outside of the general contract for cast stone; thereby eliminating many of the commonly known trade practices, under which the true intent of their specification is evaded.



A Photograph Showing Hand Carving and Random Cut Finishes of Cut Cast Stone Over Doorway

This shows the interesting texture combination of a random tooled surface. The tooling on the flat surfaces as well as on the mouldings varies on each surface. This gives a texture with the appearance of age and takes away the hard effect of straight tooling. The tooling generally has no definite direction but carries out a number of cuttings, each face of the stone being different

Architect Service

This company maintains a technical staff to assist architects and builders in all matters pertaining in the use of Dextone.

The service is without charge. It is maintained for the purpose of assisting those contemplating the use of cast stone in selecting the material best fitted to their needs, in making preliminary estimates and in drawing up specifications.

Where this service is utilized, it is frequently possible for our representatives to show the architect means whereby he can allow for the additional cost incidental to securing cut cast stone by the elimination of certain features of relatively less importance.

THE GEO. RACKLE & SONS CO.

Artstone and Concrete Roof Tile

CLEVELAND, OHIO

Products

ASHLAR, SILLS, LINTELS, CORNICE, BALUSTRADES, and all kinds of BUILDING TRIM for exterior and interior work; GOTHIC WINDOW FRAMES; CONCRETE ROOF TILE.

TRADE-MARK

The Company and Its Facilities

This firm originated Artstone nearly sixty years ago, and by reason of long experience and a superior product the confidence of architects and builders throughout the country has been gained. Ornamental work is a specialty, it being in this line that some of the greatest economies are effected.

Advantages of Artstone

A building material which is attractive, everlasting, and not high in cost is the claim for Rackle Artstone. To these qualities there may be added strength, which not only is inherent in the material itself, but is augmented by the addition of steel reinforcing. Such reinforcing is of especial value in Gothic window tracery and in all work of delicate detail.

Artstone Colors and Finishes

An almost endless variety of colors is available. White, buff, gray, red and brown in various shades and combinations are used the most. As to finishes, while smooth and tooled surfaces are still supplied, a distinct improvement has been brought about recently by the introduction of Artstone that is hand-finished while in a plastic condition. This results in a more artistic material, varying in appearance according to the method of finishing, and is far denser and more durable than was possible by the older processes.

Samples of colors and finishes may be had for the asking.

Co-operation with the Architect

The manufacturers of Rackle Artstone have always been careful to carry out with exactness the architect's ideas, and so it is always preferable to have complete information on all points from the designer of the building. But it is not always that the architect is in a position to furnish every detail required by the contractor, and in such cases the Rackle organization will often be found of service.

There are occasions, too, when the architect feels the necessity for consultation with the manufacturers of a special product such as Rackle Artstone, perhaps regarding an estimate, or the quality and tests of the material, or its adaptation to certain designs. In all matters of this nature the co-operation of the GEO. RACKLE & SONS CO. may be depended upon.

Rackle Concrete Roof Tile

Rackle reinforced concrete roof tile form a light, strong and economical roof which is fireproof, and meets every requirement of first class building construction. These tile are made in both flat and channel sections, the standard size of the former being 2x5 ft. x 1½ or 1¾ in., and of the latter being 1 ft. 6 in. x 8 ft. x 3½ in.

For foundries, shops, warehouses, garages, schools and theaters Rackle tile are especially valuable. They are laid rapidly in place on steel purlins, no forms or centering being required, and are suitable for either flat or pitched roofs.

Full information regarding Rackle tile, with sizes of purlins for different spans, etc., will be forwarded on application.

NEW JERSEY DISTRICT OFFICE: 11 Halsey Street, NEWARK, N. J.

ATLANTA TERRA COTTA CO.

GLENN BUILDING, ATLANTA, GA.

PLANT: EAST POINT, GA.
(Eight miles from Atlanta)

SOUTHWESTERN DISTRICT OFFICE: DALLAS, TEX.

REPRESENTATIVES IN ALL IMPORTANT CITIES OF THE UNITED STATES AND CANADA

Product

ATLANTIC TERRA COTTA is made in accordance with the architect's drawings and specifications, by methods that are the development of fifty years' experience. It is fundamentally dependable and durable. In design it is most adaptable in decorative modeled detail, any one color or colors in combination, and in a variety of textures. Atlantic Modeling follows the architect's sketches or instructions with spirit, character and expression. Our laboratories have developed hundreds of colors for the architect's selection. Atlantic Drafting Departments prepare clear and legible construction drawings that insure rapid and economical construction, safety and durability on every operation.

Exhibit

A large exhibit with daylight illumination of Atlantic Terra Cotta at the New York Office, shows the varied range of Atlantic colors and textures. Inspection is invited. Visits to one of our factories gladly arranged.

Uses of Terra Cotta

Atlantic Terra Cotta for entire facades or defined features thereof.

For interior sidewalls and ceilings.

For important rooms in hotels and banks, and for rotundas of public buildings.

For exterior and interior construction and decoration with masonry, steel or reinforced concrete frame.

Printed Information (Catalogues on Request)

A monthly magazine "Atlantic Terra Cotta" containing many full page plates illustrating current buildings of importance is sent to architects and designers without charge. (A.I.A. Standard Classification, File No. 9.)

Atlantic Terra Cotta Stock Design Catalogue—The catalogue illustrates Terra Cotta in a variety of complete designs and separate pieces for commercial buildings of small and moderate size. Particularly suitable for small stores and banks. Designed to aid the architect to save time and money on small buildings.

Chimney Pot Catalogue—The catalogue illustrates unusual designs and colors in from four to eight flue sizes most effective for country and suburban residences and garden type apartment houses. (A.I.A. Standard Classification File 5h3.)

Garden Pottery Catalogue—The catalogue shows reproductions of antique Florentine oil jars, table standards, sundial pedestals, bird baths, flower boxes and fountains in colored glazes and natural clay shades, deluxe in every respect. Suitable for formal or informal gardens, lobby, hall, sunroom or library.

General Information

The ATLANTIC TERRA COTTA CO. is so organized as to give the architect and contractor service broader in scope than is usual with manufacturers of building materials. Co-operation is offered in the details of design, construction, color, surface, polychrome. Conference on definite projects is strongly recommended and will be arranged at the architect's convenience.

Since 1878 the Atlantic Company has been connected with many of the most important building enterprises in the world. In many cases we have served as engineers in an advisory capacity.

The character of Atlantic Terra Cotta is indicated by the character of the buildings in which it has been employed and the standing of the architects.

Four factories permit us to execute orders for Terra Cotta with promptness for buildings of any size. A Southern factory gives every facility to architects and builders in the South.

Product

Architectural Terra Cotta of highest quality.

Services

As one of the largest terra cotta concerns in the country, the Conkling-Armstrong organization is in an exceptional position to execute, from sketch drawings if necessary, work of any description, however artistic, complex or technically difficult, and of any magnitude whatever. Information, specific or general, covering any matter relative to terra cotta and its use gladly supplied on request and without obligation.

Our Record

Forty years' experience, more than 12,000 contracts, a maintained standard of excellence during this period, are our credentials for soliciting your business.

Delivery

Large centrally located plant assures convenient delivery to any part of the United States.

Quality

Conkling-Armstrong material has long represented the best in terra cotta both as to satisfactory appearance and permanence. This has been the result of studied investigation, not only of the material, but allied facts such as support, mortar, setting, pointing, etc.

Illustrating a Fragment of the Architectural Terra Cotta Ornamentation on the Anthony Wayne Theater, Wayne, Pa.

W. H. Lee, Architect

The Architectural Terra Cotta in this building was done in a matt glaze and polychrome finish.
These perforated panels are 4 ft. 2 in. x 2 ft. 7 in. in size

Use of This Material

Schools, colleges, churches, theaters, office buildings, banks, store buildings, garages and factory buildings, trimmed with Architectural Terra Cotta, become neighborhood beautifiers.

This material, which has stood the test of time and the elements, with all its color and surface treatment possibilities is the logical building material where durability, decorative qualities and color are required to make a complete and permanent design.

Architectural Terra Cotta

MAIN OFFICE AND FACTORY

CORNING, N. Y.

AGENCIES IN ALL PRINCIPAL CITIES

Corning Architectural Terra Cotta

The Corning Terra Cotta Co., Inc., having been in business over forty years, has enjoyed a very consistent growth in its business, based on the following fundamentals of management:

Extreme Care in Execution—Through years of research and study on the part of Corning ceramic experts, colors and glazes of infinite variety are secured with extreme durability.

Modeling of the Bolder Character Used in Decorative Panel of Tennessee Theatre, Knoxville, Tenn.
Graven and Maygar, Architects, Chicago, Ill.

The modeling staff is composed of artists specializing in the different types of architecture. They are, therefore, prepared to execute exacting requirements in any required style.

With the experience and diversity of its organization the Company gives an architect and owner assurance that the Architectural Terra Cotta used in their buildings will be an exceptional investment in appearance, durability and financial return.

Service—The organization is very desirious of cooperating with architects and builders on any problems concerning the use of Architectural Terra Cotta.

The Company gives the most careful attention to the handling of prompt deliveries.

Specifications

The use of the National Terra Cotta Society's specifications shown on pages A364-367 of this volume is recommended.

Samples

Samples of representative colors and finishes will be mailed to any one on request.

Estimates

Estimates on proposed work are handled promptly for architects, contractors and owners.

GALLOWAY TERRA COTTA COMPANY

Manufacturers of Galloway Pottery

3200 Walnut Street
PHILADELPHIA, PA.

Products

GALLOWAY GARDEN and DECORATIVE POTTERY and TERRA COTTA, including: Flower Pots, Boxes, Vases, Bird Baths, Sun Dials, Tables, Benches, Hermes and Statuary.

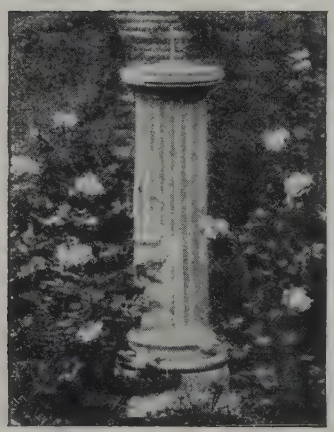
GALLOWAY HAND MADE CHIMNEY POTS.

Also Architectural Terra Cotta.

GALLOWAY POTTERY

Galloway Pottery Finishes

We find that the most popular finish is the light stony gray. Red, buff and other colors can be made to order as well as a variety of glazes, which finish is especially well suited to jars.



Sun Dial with Roses

Galloway Pottery for Garden and Interior Use

The Galloway organization has been making pottery for over a hundred years. The artistic worth, fine workmanship and durable quality of materials embodied in Galloway Pottery are all endorsed by our hundreds of pleased customer-friends.

The Galloway Pottery shown herewith represents only a few of the many original designs and replicas from antique art which we carry in stock or make to order. Careful workmanship makes Galloway Pottery a welcome addition to the finest interiors; its durability is an essential feature for out-of-doors decoration.

Catalogue

Our latest catalogue of Galloway Pottery and schedule of Chimney Pots will be sent on request.

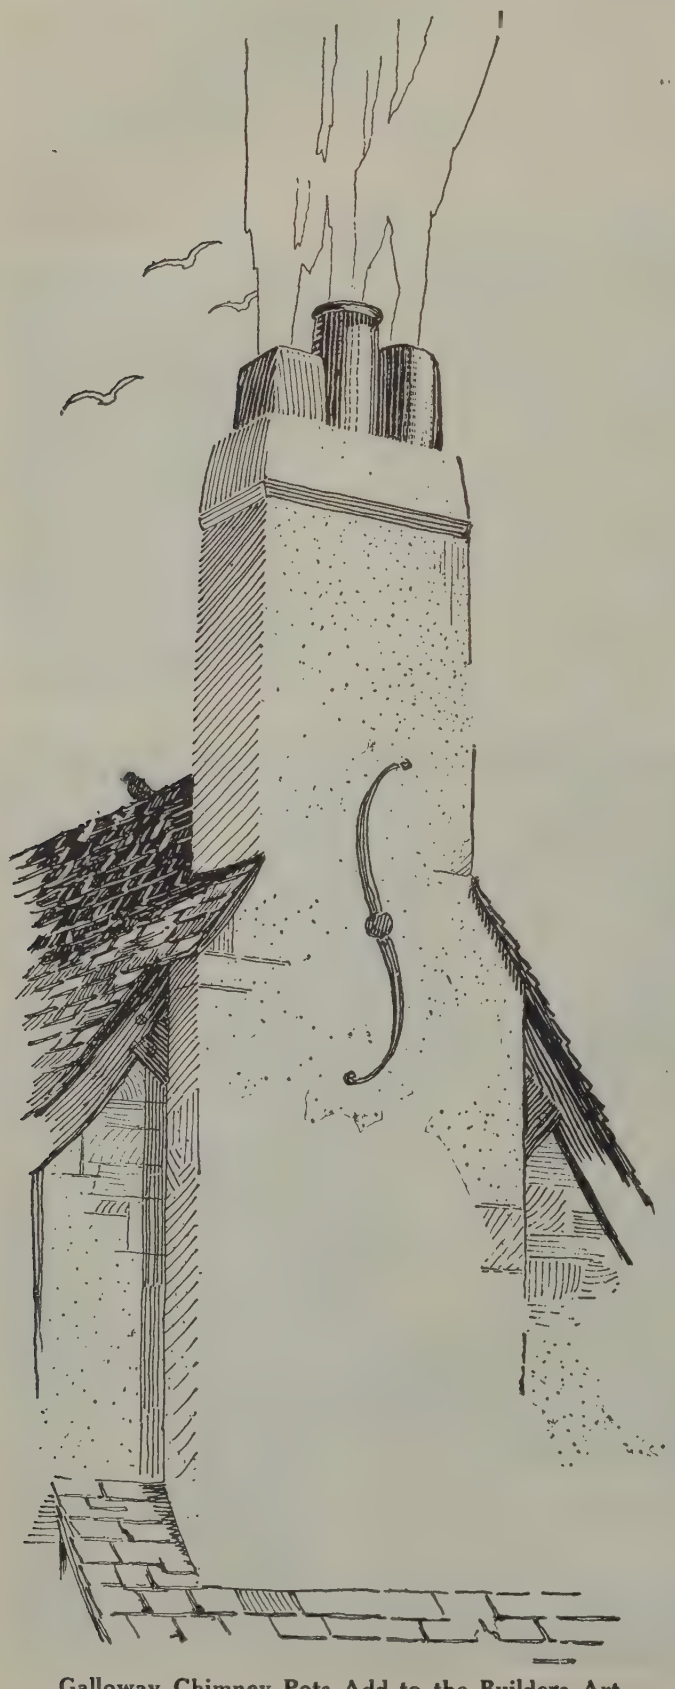
GALLOWAY *Hand Made* CHIMNEY POTS

Galloway Chimney Pots Complete the Picture

By the use of one or more types of Galloway Hand Made Chimney Pots, very pleasing effects are secured. The illustration below indicates how an element of Old World appeal can be cleverly utilized in modern residential architecture.



Galloway Chimney Pots Add to the Builders Art

Artistic and Practical Value of Chimney Pots

The graceful lines of the roof achieve an added interest when the chimney-top shows that final touch of charming color so easily attained with Galloway Hand Made Chimney Pots. Their natural shade of terra cotta medium red harmonizes with almost every color scheme—or grays, buffs and other colors can be furnished if desired.

The chimney—focal point of the roof lines—is well worthy of the artistic treatment afforded by the quaint charm of Galloway Hand Made Chimney Pots; for they add that last distinguishing touch which complements the beauties of the architectural effect.

Galloway Hand Made Chimney Pots

Galloway Hand Made Chimney Pots are made of high-fired, strong, durable terra cotta. They improve drafts, prevent rain water from washing down the flues and afford a simple method of increasing the chimney height without adding brick or stonework. Furnished in a wide range of types and sizes.

Color—The usual finish is a medium shade of red, but gray, buff and other colors will be made on order. Special designs, colors and sizes, other than those illustrated or described, can be furnished to order.

Estimates—In writing for quotations please give flue sizes, quantities and, if possible, a plan of the flues showing distances between them. If ordered a little in advance of the time when they will be needed, unnecessary delays will be avoided, particularly when special work must be executed.

Architectural Terra Cotta; Hand Made "Ageart" Terra Tile.
Face Brick; Enameled Brick; Salt Glazed "Athena" Brick; Floor Brick.
Hollow Tile Fireproofing.
Also Paving Brick.

Architectural Terra Cotta

We manufacture all kinds for exterior and interior work, decorative or plain of all colors and finishes, as well as polychrome.

Face Brick

Our line consists of all colors and finishes, together with moulded brick.
The most intricate shapes and design.

Salt Glazed "Athena Brick"

Made of three shades. Numbered 102, 103 and 104 with radius jamb and sill moulds. Also moulded base and cap, and special sanitary floor brick.

Floor Brick

In different sizes, glazed and unglazed, for use in packing houses, battery rooms, milk dairies, etc.

Enameled Brick

These can be had of the following colors: white, green, blue or brown.
Made of standard sizes and shapes.

"Ageart" Terra Tile

Special hand made roofing tile made of any form, finish or color or blended colors.

Hollow Tile

Made in standard sizes, shapes and different weights for exterior and interior construction.

Services

Architects desiring expert advice on architectural terra cotta construction, brick or fireproofing may feel free to call upon us for such service.
Extensive exhibits of our products may be seen in all our offices.
Descriptive booklets or samples may be had on request.

ARCHITECTURAL TERRA-COTTA, MACHINE-MADE TERRA-COTTA PRODUCTS, CLAY BUILDING BLOCKS, MACHINE-MADE ASHLAR

Quality

For over forty years the New York Company has manufactured terra-cotta of the highest quality only. Its product meets the most exacting requirements of architect and owner.

Service

The New York Company has at its command most complete facilities for the rendering of steady and dependable service to its customers.

United States Express Realty Company Building, New York, N. Y.

In 1905 the United States Express Realty Company erected its own office building on the block fronts Greenwich Street, Rector Street and Trinity Place, New York City. The building was erected by Thompson-Starrett Company from the plans of Clinton & Russell, Architects.

In 1926, the new owners of the office building decided to add an additional seven stories as a vertical addition. The same general contractors were chosen and again Clinton & Russell drew the plans.

The NEW YORK ARCHITECTURAL TERRA COTTA COMPANY furnished the original terra-cotta facing of this building in 1905 and were again chosen twenty-one years after to exactly match the old terra-cotta for the additional seven stories.

In the completed building, as it stands today, it would be difficult to tell where the old terra-cotta ends and the new terra-cotta begins

Terra-Cotta

Ceramic finishes of proved merit cover such a wide range that the variety of selection presented to architect and owner is almost limitless. The New York Company presents the results of forty years' constant research in this department. The New York Company applies these ceramic finishes to terra-cotta which has been fabricated to outlast the building of which it will form a part.

Only the highest grade of selected clays, scientifically mixed and thoroughly pugged, tempered and aged enter into the construction of the New York Company terra-cotta.

With solidly pressed faces, sides and ends, all of honest thickness, and with heavy struts adequately placed, each piece of New York Company terra-cotta carries with it the New York Company guarantee.

Tee Pee Cee Standard Profiles

To meet the demand for selection of wide range of ceramic colors in standardized profiles for sills, copings, band courses, ashlars, mouldings, etc., we offer die run products made from precisely the same materials as the hand-made architectural terra-cotta, but at economy of price made possible only through standardization and machine fabrication.

Because of the standardized method of packaging, this Tee Pee Cee machine-made product is available for the smallest jobs at the same price per unit charged for larger quantities. Small orders receive the same prompt and careful attention given to larger shipments.

For color plates, construction plates and specifications, see the three following pages.

Continued on next page

MACHINE-MADE TERRA-COTTA PRODUCTS, ASHLAR BLOCKS FOR WALL FACING OR FOR COMPLETE BONDED WALL; TEE PEE CEE CLAY BUILDING BLOCKS

The Need

During recent years, a widespread demand has become evident for a very economical terra-cotta in which the owner might get the benefit of standardized machine production, without sacrifice of the enduring quality and the wide color selection to be had in the hand-made architectural terra-cotta.

Development

To meet this demand our research and engineering departments began about five years ago the production of terra-cotta by machine through steam lubricated steel dies, with sections cut to standard lengths, then dried, sprayed and burned exactly the same as the hand-made product. This material combines all of the well-known advantages of architectural terra-cotta with all of the economies of mechanical quantity production.

These terra-cotta ashlar blocks may either be specified as a complete wall in and of themselves, or as facing, or to course and bond with brick backing. Used as facing, the ashlar usually courses 7¼ in. high by 1 ft. 4¼-in. lengths. Used to bond with brick backing the ashlar usually courses 8¼ in. high.

Diversified Uses

Since the impervious surface of terra-cotta requires no upkeep, but may be cleaned and re-cleaned with soap and water as long as the building stands, the material is ideal for public and semipublic buildings, hospitals and schools, also for laboratories, dairies, power plants, etc.

A few installations are cited here:

Chemical Laboratory, Princeton University, Princeton, N. J., Chas. Z. Klauder, successor to Day & Klauder, Architects

Grade School, University Place, Port Chester, N. Y., Tooker & Marsh, Architects

Auditorium, Gymnasium Building, Canandaigua, N. Y., Wilson Potter, Architect

Residence, Stanwich & Taconic Roads, Greenwich, Conn., Thompson & Churchill, Architects

School for Church of Resurrection, Boston Post Rd., Rye, N. Y., Murphy & Lehmann, Architects

Grade School, South River, N. J., Alexander Merchant, Architect

Laundry for Apartment House, 989-1003 First Avenue, New York, N. Y., George & Edward Blum, Architects

Cord Meyer Garage, N. S. Roosevelt Avenue bet. 88th and 89th Streets, Elmhurst, L. I., N. Y., Robert Tappan, Architect

Overbrook Hospital, Cedar Grove, N. J., Henry Berg, Plant Supt. of County Inst. of Essex Co., Overbrook County Hospital, Architect

School, Marion Street & Waverly Avenue, Lynbrook, L. I., Oscar Lowinson, Architect

Mattress Room for Mt. Sinai Hospital, 5th Avenue & 100th Street, New York City, A. W. Brunner Associates, Architects

Garage Building for St. Francis Hospital, S. W. Cor. 9th & Erie Streets, Jersey City, N. J., Christian H. Ziegler, Architect

Squash Court for Gymnasium, Princeton, N. J., Aymar Embury 2nd, Architect

Bakery, 99th Avenue and 222nd Street, Queens Village, New York, N. Y., Henry Holder, Architect

School, Beacon, N. Y., Tooker & Marsh, Architects

Ursuline School, New Rochelle, N. Y., McGill & Hamlin, Architects

Economy

An independent survey conducted by the Department of Education of the City of New York disclosed that at unit price customarily used in our estimates this material which eliminates all cost of upkeep after first installation amortises as against 4 in. hollow tile, plaster and wall paint upon second repainting of the plastered wall.

Construction Details

It affords us much pleasure to present the construction sheet shown on second following page and our engineering and laboratory departments are at the service of architects who desire more particular and detailed information.

For working details to larger scale, ask for Folder No. 9c.

Other Products

Machine-made window sills, mouldings, band courses, ashlars to match and the Grueby terra-cotta products block.

Estimates

Estimates may be had upon the square foot or unit basis, but we recommend adherence to the long-established usage of the architectural terra-cotta industry, whereby, as manufacturers, we issue lump sum estimates upon quantities which we compute from architect's elevations and floor plans.

It should be noted that where special hand-made blocks are required to furnish a complete job, we include them in such estimates and fabricate the specials in our departments for hand-made work.

Suggested Form of Specification

Machine-made clay building block facing, glazed [unglazed], and of color to be selected by architect, to course 7 in. high, net size (8 in. high net size when shown to bond with brick), x 16 in. long net size, with cuts to break joint, and with all necessary mitres, bullnose and angle blocks, sill, lintel, jamb, cove base and capping blocks to make a complete job.

These blocks are to be fabricated of carefully selected, thoroughly ground, screened and pugged architectural terra-cotta body, with ample grog [grit] component so that the block will burn straight and true.

Thickness of blocks shall be from 2 to 8 in., as required to suit architect's details.

Blocks shall have solid back, and shall be glazed on exposed faces and returns only, so that bed joints and backs shall afford good absorptive surface for adhesion of mortar or plaster.

Blocks shall be as made by the Terra Cotta Products Corporation or the New York Architectural Terra Cotta Company, or equal and shall be carefully packed for delivery to mason contractor.

For specifications for hand-made architectural terra-cotta, see pages of the National Terra Cotta Society in this section.

Products

ARCHITECTURAL TERRA COTTA for exteriors and interiors of buildings of the permanent type.

Also Solid Back Machine Made Clay Building Blocks, glazed in all ceramic colors, particularly adapted to interiors, school corridors, power stations, hospitals and all places where a fire-resisting, light reflecting, sanitary wall is desired.

Quality

New Jersey Terra Cotta is in every sense of the word a quality product. Graduate ceramic engineers, trained in correct terra cotta technique, are constantly adding new color glaze combinations and textures to a palette which even now possesses a wonderful range of richness, giving the designer an almost unlimited choice of imperishable colors, backed by the qualities gained through thirty-eight years of achievement in the production of terra cotta.

Modeling

Directing this department is an artist of exceptional ability and training, and under his guidance is a group of artists eminently qualified to create with stylistic correctness decorations in relief, ranging from the accepted classic forms to the art modern.

Production

NEW JERSEY TERRA COTTA COMPANY owns and operates two large and modern factories located at Perth Amboy and South Amboy, New Jersey, each with a personnel technically equipped to efficiently produce in large quantity the finest terra cotta.

Service

Technical information on construction, design and color possibilities is promptly available upon request, without charge.

Price

For definite price, send us architects' elevations and floor plans and specifications, if available.

Services of the Society

The NATIONAL TERRA COTTA SOCIETY is a bureau operated by the manufacturers of terra cotta in the United States for the technical and artistic improvement of product, the dissemination of authentic information relating to it and the assistance of the architectural and engineering professions in the proper and effective employment of this material. In addition to the Standard Specifications printed below the Society issues other helpful literature relating to the proper construction of terra cotta and the use of color in architectural design; also illustrated brochures pertaining to various classes of buildings.

Its individual member companies are also prepared to assist architects with counsel and recommendation upon the use of terra cotta in specific instances of application, and to furnish samples of their product when desired.

Standard Specifications for the Manufacture, Furnishing and Setting of Terra Cotta

These Specifications were prepared with the assistance of representatives of the Structural Service Committee of the American Institute of Architects and of the National Bureau of Standards, U. S. Department of Commerce, Washington, D. C.

Note: The Architect or Specification Writer will find it convenient to follow the Short Form Specifications beginning with Section 63.

The Short Form incorporates all the provisions of the Standard Terra Cotta Specification, but eliminates the necessity of mentioning them in detail.

Reference to the Glossary, Sections 50-62, will supply the surface finish, ceramic finish, and color data necessary to specify surface and color correctly.

The Corollary Clauses, Sections 85, 86, explain the setting option between mason and manufacturer.

Sections 87-91 under Corollary Clauses explain the specifications for flashing, sheet metal, structural steel, structural concrete and rough carpentry. These specifications form a part of the Terra Cotta Specification, although the materials are supplied and set in place by different contracting parties.

A—General Information

Drawings and Schedules

1. The Terra Cotta manufacturer shall be furnished with all drawings, details and other information necessary for the manufacture of Terra Cotta, including drawings for all classes of work with which the Terra Cotta engages.

2. Wherever Terra Cotta is required to match in contour, color, finish and surface treatment, existing Terra Cotta, as for example in connection with alterations or additions to existing work, the Terra Cotta manufacturer shall be furnished with the required profiles and samples of the original work, and other needed information.

3. The Terra Cotta manufacturer shall, before proceeding with manufacture, submit to the architect for his correction and approval, shop drawings showing jointing and construction of the Terra Cotta and provision made for all flashing and counter flashing. These drawings must conform as nearly as practicable to the architect's drawings, but shall be in accordance with good Terra Cotta structural practice.

4. All pieces of Terra Cotta shall be numbered. The Terra Cotta manufacturer shall provide two copies of the completed scale shop drawings to be used for setting and showing the piece numbering of the Terra Cotta, and the size of the joints to be used for setting the various portions of the work clearly indicated. These drawings shall be designated as the setting drawings.

Continued on next page

5. The Terra Cotta manufacturer shall furnish, as promptly as possible, a schedule of all special anchors, hangers, etc., necessary to secure and support the Terra Cotta in a manner approved by the architect.

B—Material

Quality, Tests

6. *Note:* In view of the researches now being conducted by the National Bureau of Standards at the instance of the National Terra Cotta Society, it seems inadvisable to attempt, at this time, to write either quality clauses in terms of crushing strengths, densities and elasticity, or specifications for tests. Clauses descriptive of the desirable physical characteristics and of tests to prove compliance of the material with such physical requirements will be prepared as soon as the necessary data are available and inserted in a later edition of this standard specification.

Modeling

7. All ornament shall be artistically modeled by the Terra Cotta manufacturer's staff artists. (Or, models made to Terra Cotta shrinkage scale will be furnished to Terra Cotta manufacturer, without cost to him, securely crated for shipment f.o.b. modellers' studio at .)

8. Photographs in duplicate of all ornament shall be submitted to the architect for his approval or correction, or, if he so desires, he may inspect all modeling at the factory. Such approval or inspection by the architect shall be made promptly. No ornamental work shall be burned until modeling has been approved.

Surface Finish, Ceramic Finish and Color

9. The surface finish, ceramic finish and color of all exposed surfaces of Terra Cotta shall be as indicated by the architect's drawings or as specified. For surface and ceramic treatments, see Glossary of Terms relating to Terra Cotta, which is hereby made a part of this specification.

10. The ceramic finish shall be applied to the Terra Cotta in such a manner as thoroughly to coat the exposed surfaces.

Samples

11. The Terra Cotta manufacturer shall submit samples of the color or colors of the ceramic finish to the architect for his approval, and all Terra Cotta shall conform without marked variation to the sample or samples so approved.

C—Design and Structure

Ends, Walls and Partitions

12. Walls shall not be less than one inch thick and partitions shall be of such thickness and so spaced as to perform their proper functions with regard to form and structure. Each piece of Terra Cotta shall be provided with the necessary anchor holes and hand holes and shall be so formed as properly to engage the structure. Beds generally shall be not less than 4 in. deep.

Washes, Weep Holes and Drips

13. Projecting courses, cornices and heavy ornamental detail may have washes, drips and weep holes, where shown on the approved shop drawings.

Preparation for Flashing

14. Where so shown the washes of all projecting cornices and other exposed horizontal surfaces shall have provision made for flashing. All surfaces where the wash pitches inward toward the structure and stops against superimposed work; all balcony floors, and all gutter grades shall have provision made for flashing.

15. Raggles shall be provided to receive gutter linings and flashings when the joints can not be used for the purpose. Raggles shall be not less than ¾ in. deep.

16. All capping courses, copings and sills except of the "slip" type, shall have stools and lugs at intersections with vertical surfaces.

Joints

17. All joints shall be straight and true and of an approximate uniform width of ¼ in. All Terra Cotta shall be laid out at the factory to test it for uniformity of joint widths and over-all dimensions. Where necessary to secure accurate dimensions and uniform joint widths, the material shall be sized straight and true.

D—Transportation, Storage and Protection

Shipment, Delivery and Care

18. Unless otherwise specifically agreed, all Terra Cotta shall be furnished by the manufacturer f.o.b. cars factory, with freight allowed to destination. All Terra Cotta shall be carefully packed in hay, straw, excelsior or other suitable material.

Replacements

19. If any pieces of Terra Cotta are damaged in transit, the manufacturer shall be immediately notified in writing by the setting contractor and proceed with the remaking of the pieces. The responsibility for the cost of such replacements shall be determined by the point of delivery fixed by the contract under which the Terra Cotta is delivered. If the point of delivery is beyond the immediate control of the manufacturer, the setting contractor shall assume responsibility for the necessary proof of damage.

E—Erection

Handling

20. The setting contractor shall receive the Terra Cotta on arrival at the freight yards and shall transfer it without damage from the cars to the building. When the Terra Cotta manufacturer delivers on trucks at the building the setting contractor shall unload and store the Terra Cotta. Terra Cotta shall be stored under cover not in contact with the ground, stacked without inflammable packing on wood laths or strips, so as to protect it from injury.

Mechanics

21. All Terra Cotta shall be set by mechanics experienced in the handling and setting of the material.

Cutting and Fitting at the Building

22. Notice of errors in the manufacture of the Terra Cotta shall be given to the manufacturer immediately upon discovery. Cutting or fitting due to such errors shall be done by the Terra Cotta manufacturer or shall be paid for by him if he fails to do the necessary cutting or fitting promptly upon receipt of notice.

23. Other necessary cutting and fitting of the Terra Cotta that may be required at the building, including all fitting around anchors, steel and iron work and reinforced concrete, shall be done by the contractor for setting Terra Cotta.

Supporting Metal Work and Anchors

24. *In Connection with Structural Steel*—Beams, channels, angles, T's, plates and fabricated members for supporting Terra Cotta and which are not secured to the structural steel by rivets or short bolts, as shown on the architect's drawings, together with all anchors, hangers, bolts, clips, straps, rods and pins for securing Terra Cotta, shall be furnished and set by the contractor for setting Terra Cotta.

25. *In Connection with Structural Concrete*—The contractor for structural concrete shall furnish and set all supporting metal work inbedded in the concrete and all shelf angles and continuous rods. All such metal work shall conform to the requirements of the setting drawings prepared by the Terra Cotta manufacturer.

26. All other loose iron such as clamps, hangers, clips, straps, and pins shall be furnished and set by the Contractor for setting Terra Cotta.

27. All anchors, hangers, bolts, clips, straps, rods and pins for securing Terra Cotta shall be of wrought iron or non-corroding soft steel.

28. Anchors, hangers, bolts, clips, straps, rods and pins for securing the Terra Cotta, except where otherwise shown or specified, shall be of the following minimum sizes:

29. Anchors:—(a) For ashlar or courses balanced on the wall, shall be ¼x¼ in. or ⅛x⅝ in., or No. 6 gauge galvanized wire.

30. (b) For projecting courses not balanced on the wall, shall be not less than ⅝-in. round or square bars or equal cross section.

31. Hangers shall be ⅝-in. diameter round bars or other shapes of equal cross section area.

32. Clips and straps shall be ⅜x2 in.

33. Pins shall be ½-in. diameter round bars.

34. Continuous rods on concrete wall faces to which Terra Cotta ashlar is clipped, shall be ⅝-in. diameter round bars which shall be secured to the masonry with ½-in. diameter round anchors placed not more than 2 ft. 0 in. on centers.

35. All steel or iron supporting metal work shall be clean and thoroughly protected with two coats of pure red lead and linseed oil paint, asphaltum applied hot, or other approved protective compound.

Protection of Supporting Metal Work

36. Metal work of every description, supporting Terra Cotta, shall be imbedded thoroughly in the masonry backing and when not so imbedded, metal work shall be protected against corrosion by encasing with cement mortar or in cement mortar masonry.

37. When the back of a Terra Cotta course comes in con-

Continued on next page

tact with iron or structural concrete in such manner as to prevent the encasing of supporting iron from the rear, an opening shall be made in the top to admit of the placing of the encasing mortar as required above.

Mortar

38. All cement used for setting mortar shall be a standard brand of Portland cement fulfilling the requirements both physical and chemical of the standard specifications for Portland cement adopted by the American Society for Testing Materials.

39. All sand used for setting mortar shall be clean, sharp and well graded in size.

40. All mortar for setting and pointing shall be composed of one volume of Portland cement to three volumes of sand. Hydrated lime, not to exceed 9 pounds to the sack of cement, shall be added.

41. The sand and cement and lime, if any, shall be thoroughly mixed dry before any water is added. The use of retempered mortar shall not be permitted.

Setting

42. All Terra Cotta shall be set true to a line and carefully laid in a solid bed of mortar. All rebates in bed and cross joints from front to back and top to bottom, shall be filled solid with mortar leaving no voids. Each piece of Terra Cotta shall be tamped into place, excess mortar cut off and struck with a jointer or trowel. All sills, wall copings and other capping courses, shall be set in a thick bed of mortar and well pounded down so that the mortar fills all spaces around bottom of webs of Terra Cotta.

43. All Terra Cotta projecting courses shall be so set that the arris casting a shadow shall be true to line.

44. When the Terra Cotta work is of such scope or character that the proper handling and setting of the Terra Cotta require special skill and knowledge, the Terra Cotta manufacturer shall, if required by the contract, furnish a competent Terra Cotta setter to assist in the sorting, selecting and handling of the Terra Cotta, to co-operate with the setting contractor, to assist him when cutting or fitting of the Terra Cotta is necessary, to advise as to interpretation of setting drawings, and to help generally in securing rapid, efficient progress during the setting of the Terra Cotta. For such service the setting contractor shall pay such setter full time at his regular wage rate. When the furnishing of such a competent setter involves traveling expenses, the setting contractor shall pay the same and also make an allowance for his board.

45. When the services of such a competent setter are not required under the contract, the Terra Cotta manufacturer may, at his own option and expense, send such a representative to the work who shall perform the above services, and the setting contractor shall co-operate with and aid and facilitate the performance of such services by such representative.

Pointing

46. All joints in Terra Cotta shall be pointed and struck as the setting progresses except in freezing weather. In freezing weather and when re-pointing is necessary, all joints shall be raked or cut out to a depth of ½ in. and the pointing mortar driven into the joint and struck with a jointing tool.

47. All joints in overhanging Terra Cotta, balustrades, parapets and free standing features shall have joints raked out one-half (½) inch, and pointed with an approved elastic cement.

Protection

48. All uncompleted walls including Terra Cotta and backing shall be protected by waterproof covering at night and at any time when liable to injury from storms or freezing.

(Note: All other protection required for projecting courses, jambs of openings, etc., is provided for under the work of other trades.)

Cleaning Down

49. Upon completion of the work, mason's wedges, shoring, supports and centering and all other false work and protections shall be removed and the Terra Cotta cleaned down. If satisfactory results can not be obtained by the use of abrasive soap or washing powder, a solution consisting of 1½ pints of muriatic acid to a gallon of water may be used. In the use of acid solutions only wooden pails and fibre brushes shall be employed.

Glossary of Terms Relating to Terra Cotta

Surface Finish

50. Surface Finish designates the texture of the surface of the clay body prior to application of Ceramic Finish.

51. It may be:

(a) *Smooth.*
(b) *Tooled or Drove.*
(b1) Eight lines to the inch.
(b2) Six lines to the inch.
(c) *Light irregular drag or combing.*
(d) *Heavy irregular drag or combing.*
(e) *Special.*

52. A special Surface Finish like "bush-hammered," "pitted," "vermiculated," etc., involves extra expense and, if required, should be clearly specified.

53. *Surface Finish for unglazed surfaces* may be smooth or may be tooled with a light or heavy drag. Flat surfaces of sufficient width may be tooled, while the curved surfaces of mouldings may be left smooth.

Surface Finish for glazed Ceramic Finish (whether lustrous or mat) is usually made smooth.

54. *Granite Colors,* if unglazed, may be made smooth or with irregular drag, or pitted. A bush-hammered or special surface involves extra expense, and if required should be clearly specified. If glazed Ceramic Finish is used for Granite Colors the surface treatment is usually smooth.

Ceramic Finish and Color

55. Ceramic Finish designates the surface and color applied by the ceramic processes of coating, glazing, burning, etc.

56. (1) *Unglazed Terra Cotta:* Terra Cotta with a Ceramic Finish producing an unglazed finish made in various shades of buff, gray, salmon, red and brown. Most colors thus made are vitreous.

57. (2) *Glazed or Enameled Terra Cotta:* Terra Cotta having an impervious Ceramic Finish of a glassy texture which may be either lustrous or mat (sometimes designated as full or dull glazes or enamels) made in various colors.

58. (3) *Granite Color Terra Cotta:*

(a) Unglazed Granite Color:—A mottled Ceramic Finish similar to unpolished granite.

(b) Glazed or Enameled Granite Color:—A mottled Ceramic Finish similar to polished granite, made either lustrous or mat.

59. (4) *Polychrome Terra Cotta or Faience:* Terra Cotta having two or more colors on the same piece.

(a) Polychrome, Unglazed:—Unglazed Terra Cotta having two or more colors on the same piece.

(b) Polychrome, Glazed:—Glazed Terra Cotta having two or more colors on the same piece.

(c) Polychrome, Blended Colors:—Made only in glazed Terra Cotta. If, in polychrome glazed work, the colors are not to be separated by definite lines or contours of ornaments, but are to be blended together by brush treatment, or the like, the term "Polychrome, blended colors" shall be used. The character of work expected should be explicitly described.

(Note: For polychrome work always clearly specify the work to be done and the number of colors on a single piece.)

60. (5) *Special:* There are a number of Ceramic Finishes used by individual manufacturers the processes for which are patented or the names copyrighted which are not included in this Glossary.

61. (6) *Semi-Glaze:* An ambiguous term which should never be used.

62. (7) *Fire-Gilding:* A coating of gold glaze either mat or lustrous, fixed by an additional burning. (The area of surface to be gilded should be clearly described.)

Short Form Specification for Incorporation in the Architect's Specifications

To be used in connection with Standard Specifications and the Standard General Conditions of the American Institute of Architects.

63. *Note to Architect:*—The Standard Specification does not state who shall set the Terra Cotta, who shall provide wood centering, scaffolding, hoists, cover boards and protection (except tops of walls against weather). It does not include any cement or concrete work in connection with forming gutter grades and washes on projecting courses and features, or the furnishing or setting of sheet metal flashings and gutter linings. It does not include the furnishing and erection of metal supporting members which are riveted or bolted with short bolts to the structural steel or structural concrete. It requires the architect to show on his drawings the sizes and arrangement of rolled or fabricated structural shapes used for supporting Terra Cotta. (See notes on corollary clauses at end of this specification for the work of other trades to take care of such omissions.)

General Conditions

64. The general conditions of the American Institute of Architects, Third Edition, shall form a part of this specification and contract and all work shall be subject to the provisions thereof.

Continued on next page

Work Included

65. The work included in the contract comprises the manufacture, (and) delivery (and setting) of all Terra Cotta in accordance with the contract drawings and these specifications.

66. All (here insert a complete description of work) shall be of Terra Cotta.

Work Not Included

67. The following items are not included as a part of the contract for furnishing (and setting) Terra Cotta.

(a) Masonry backing. See specifications for (.....).

(b) The furnishing and erection of metal supporting members which are riveted or bolted with short bolts to the structural steel. See specifications for (.....).

(c) Cement or concrete grading for gutters, washes, floors, etc. See specifications for (.....).

(d) Furnishing and setting sheet metal, see specifications for (.....).

Materials and Workmanship

68. All Terra Cotta work under this contract, except as hereinafter specified, shall be executed in strict conformity with the Standard Specification for the Manufacture, Furnishing and Setting of Terra Cotta, adopted by the NATIONAL TERRA COTTA SOCIETY; which Standard Specification is hereby declared and made a part of this specification with the same force and effect as if written herein in full.

Surface Finish, Ceramic Finish and Color

69. All Terra Cotta

(Note: If several textures or finishes are to be used give location of each.)

shall be

70. (1) *Unglazed.*

Surface Finish or flat members shall be

(a) *Smooth.*

(b) *Tooled or Drove.*

(b1) Eight lines to the inch.

(b2) Six lines to the inch.

(c) *Light irregular drag or combing.*

(d) *Heavy irregular drag or combing.*

(e) *Special.*

(Note: Special surface finishes like "bush-hammered," "pitted," "vermiculated," etc., should be described.)

71. The surface finishes of mouldings and curved surfaces generally shall be

(Note: Unless otherwise specified these surfaces are generally made smooth.)

72. (2) *Unglazed Granite Colors*—Surface finishes of flat members generally shall be (a, b, c, d, e). The surface finish of mouldings and curved surfaces generally shall be

(Note: Unless otherwise specified these surfaces are generally made smooth.)

73. (3) *Lustrous or Full Glazed or Enameled*—Surface finish shall be

(Note: Unless otherwise specified these surfaces are generally made smooth.)

74. (4) *Mat or Dull Glazed or Enameled*—Surface finish shall be

(See Note 3.)

75. (5) *Lustrous or Full Glazed or Enameled Granite*—Surface finish shall be

(See Note 3.)

76. (6) *Mat or Dull Glazed Enameled Granite*—Surface finish shall be

(See Note 3.)

77. The color of the Terra Cotta generally shall be (.....) as per approved sample or samples.

78. (7) The Terra Cotta comprising....(described here in detail....) shall be (two, three, four) color polychrome. Colors (....specify where....) shall be blended.

79. (8) The surface finishes of (....specify where....) shall be fire gilded with (mat or lustrous) gold glaze.

(Note: Sections 1, 2, 3, 4, 5, 6 are alternates. If there is no polychrome work or no fire gilding omit sections 7 and 8. Sections a, b, c, d, e, are alternates for surface finish.)

Delivery

80. The Terra Cotta manufacturer shall furnish and deliver (f.o.b. cars factory with freight allowed to destination) (on trucks at the site of the building) (and set) all the Terra Cotta as indicated on the drawings or as here described.

Setting

81. All Terra Cotta shall be set by (Terra Cotta manufacturer) (mason.....). For such anchors and metal work as are to be furnished by the setting contractor see Standard Specification.

(Note to Architect: If the Terra Cotta manufacturer is to set his material include the following clause in the Terra Cotta specification. See also suggested clauses at end of this specification to take care of these omissions and for incorporation in the specifications for the work of other trades.)

82. "Hoisting service, storage space, setting mortar delivered on the scaffold, outside and inside scaffolds, runways and platforms, water, temporary light and removal of refuse, shall be furnished to the Terra Cotta manufacturer free of charge by the (....mason contractor....)."

Terra Cotta Setter

(Note to Architect: If the work is of such scope or character that the proper handling and setting requires special skill, the following clause may be inserted:)

"The Terra Cotta manufacturer shall furnish at the expense of the setting contractor a competent Terra Cotta setter to assist in the sorting, selecting, handling and setting of the Terra Cotta."

Joints

83. (The Standard Specification does not require any joints to be rubbed. If rubbed joints are to be required it should be so stated here.)

84. (The Standard Specification requires all joints to be approximately ¼ in. wide. If joints of a different width are desired it should be so stated here.)

Suggestions for Corollary Clauses

85. 1.—If the Terra Cotta is to be set by the Terra Cotta manufacturer, a clause similar in purport to the following should be included in the general requirements relating to masonry or brick work:

86. "Terra Cotta will be furnished and set by the Terra Cotta manufacturer. Hoisting service, storage space, setting mortar delivered on the scaffold, outside and inside scaffolds, runways and platforms, water, temporary light and removal of refuse shall be furnished to the Terra Cotta manufacturer, free of charge, by the (mason contractor)." A provision should also be included to the effect that the (mason contractor) shall construct the brick (concrete) backing for the Terra Cotta and "The backing shall proceed simultaneously with the setting of Terra Cotta. Each piece of Terra Cotta shall be backed up solid with brick and mortar, so as to make a perfect bond and homogeneous mass between wall lines. This backing shall extend beyond the wall line when necessary to structural stability. If concrete is used it shall not be stronger than a 1 to 9 mixture."

Also a provision under which the (mason) contractor shall place all concrete or cement grading for gutters, washes and balcony, loggia or other floors.

87. In the case of parapet walls specifications should state that flashing if used shall be carried through the wall, or if flashing be not used the back of the parapet wall shall be damp-proofed and the waterproofing carried through the wall.

88. 2.—In the specifications for sheet metal work there should be included a clause similar in purport to the following:

"The washes on all cornices and other exposed surfaces, where shown or specified, shall be covered with ( ) which shall be turned up against vertical surfaces (cap flashed) and cemented into the raggles provided for the purpose in the Terra Cotta."

89. 3.—Structural Supports.

Under "Structural Steel," a clause similar in purport to the following should be included:

"Beams, channels, angles, T's, plates and fabricated members for supporting Terra Cotta, and which are secured to the structural steel with short bolts or rivets, shall be furnished and erected by the contractor for (structural steel.)"

90. Under "Structural Concrete" a clause similar in purport to the following should be included:

"Steel beams, channels, angles, T's, plates, fabricated brackets and outlookers and other members, bolts, rods, wires, anchors, and sleeves for supporting Terra Cotta, which are inbedded in the structural concrete, also shelf angles and continuous rods attached to structural concrete shall be furnished and set by the contractor for structural concrete, in strict accordance with setting drawings prepared by the Terra Cotta manufacturer." (For information as to the sizes and character of bolts, rods, anchors, etc., see Section E paragraphs 24 to 35 inclusive on "Supporting Metal Work and Anchors" of Standard Specification for the Manufacture, Furnishing and Setting of Terra Cotta. Such supports should be clearly shown on the drawings.)

91. 4.—Under "Rough Carpentry" or other suitable division of work, there should be included a clause providing that the contractor shall furnish, set and maintain all centering, cover boards, boxing and protection for Terra Cotta, and remove the same upon completion of the work.

Products

ARCHITECTURAL TERRA COTTA for exteriors and interiors, in plain, ornamental or sculptured design, in all known finishes, and in any desired color or combinations of color.

Also Northwestern Terra Cotta in stock designs; Northwestern Multi-unit Sills for steel sash windows; Northwestern Chimney Pots; Northwestern Garden Pottery; Northwestern Faience.

Northwestern Service

More than fifty years of practical experience has equipped THE NORTHWESTERN TERRA COTTA COMPANY with both personnel and plants that insure a service unsurpassed in this industry.

For the *architect:* Northwestern experts co-operate with the architect, from the concept of the building, to furnish the technical information necessary to secure desired results.

For the *builder:* Northwestern executives give personal attention to the making of prompt and proper deliveries, thus reducing labor cost and obviating time penalties.

For the *owner:* Northwestern reputation and responsibility guarantee both the quality and the character of Northwestern Terra Cotta, which in turn insures a satisfactory yield on the owner's investment.

Northwestern Facilities

Within the last year the Chicago Heights plant has been added to those at Chicago, Denver, and St. Louis, further increasing the capacity of the company, which was already the largest as well as the oldest company engaged in the manufacture of terra cotta in America. THE NORTHWESTERN TERRA COTTA COMPANY has production facilities adaptable to the largest or the smallest job.

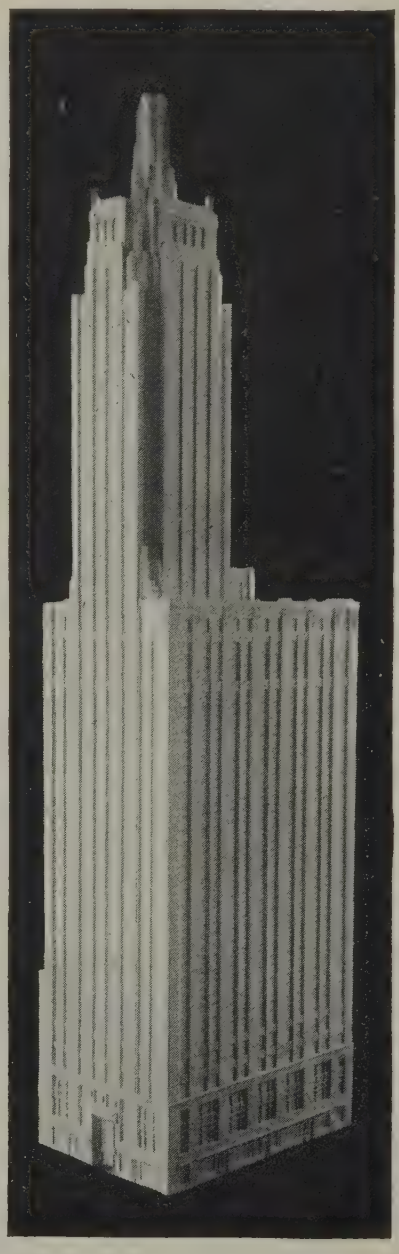
Northwestern Terra Cotta

Glazed Northwestern Terra Cotta is impervious to moisture, and is made in any one of three degrees of gloss, viz.: bright, satin and matt.

Unglazed Northwestern Terra Cotta is covered with a slip coating of varying degrees of hardness and sheen.

Either glazed or unglazed material may have a plain, pulsichrome, speckled, mottled, granite, old ivory, fire flashed, shaded, blended, or special color treatment.

All ceramic finishes are applied over a mechanical surface finish as selected: either smooth, tooled, drove, irregular drag or combing, bush hammered, rugged, pitted or special.



Carbon and Carbide Building, Chicago, Ill. (Model)

Northwestern Quality

Northwestern Terra Cotta is made from special fire clays, carefully selected by laboratory tests to produce a finished product rarely equaled and never surpassed for beauty and durability.

The Northwestern staff of ceramic experts, trained through three generations of constant improvement, are past masters of design, of color and of texture—the three essentials in architectural terra cotta.

Northwestern Specifications

In making out specifications for any terra cotta structure, always use the word "Northwestern," in connection with the color treatments, mechanical and ceramic finishes desired, and thus secure that quality of product and that character of service which has established Northwestern leadership for over half a century.

Northwestern Color Service

Recognizing the tremendous possibilities for the use of color architecturally, and appreciating the problems that will come with this development, THE NORTHWESTERN TERRA COTTA COMPANY has established a Consulting Color Service and places it at the disposal of any architect who may have a color problem to solve.

There is no charge for this service, neither does it carry with it any obligation from the architect to the company. It brings to you the results of years of thought, study and experiment in the application of color to the interior of buildings of all classes.

There are certain well-defined principles for the application of color to exteriors. These principles have been worked out not only by our own staff, but by consulting colorists of authority and repute, to the end, we hope, that this service may be the most practical and helpful ever offered to architects by any building material manufacturer.

Continued on next page

Growing Trend to Color

You need only look through the pages of popular magazines to recognize and appreciate the tremendous trend to color in all lines of business. Note the brilliancy of the lacquers now so popular. Observe the color treatments of the most exclusive as well as the most popular automobiles. See how brilliant color has become the keynote for interior decorations.

These striking uses of color show conclusively that the American people appreciate color in every grade of its development.

The architects who recognize this national trend of color, and use color for the inspiring motif of their architectural masterpieces, will find an unusually sympathetic response on the part of their clients.

In the days of the Renaissance the architect was also a painter and a sculptor. He majored in color as well as in form, as is evidenced by the masterpieces of Michelangelo and Raphael.

Today the architect must be equally versatile. Besides a complete mastery of form, he must have a thorough knowledge of color in all its aspects in relation to architecture.

American architects now have the opportunity to follow in the footsteps of these illustrious masters, but they have better materials to work with.

Northwestern Advantages

Northwestern Terra Cotta offers all of the advantages of form that any other material can offer. It offers additional advantages in its various surfaces, different finishes, and enduring beauty. To these is added the charm of color, from pleasing tints to brilliant hues—either in plain, ornamental or sculptured surfaces.

Among a few of the notable Northwestern Terra Cotta structures are:

The Wrigley Buildings, Pure Oil Building, Bell Building, Pittsfield Building, Builders Building, Insurance Exchange Building, and State Bank Building in Chicago; the American Insurance Union Citadel in Columbus, Ohio; the Union Central Life Insurance Annex in Cincinnati, Ohio; and hundreds of similar outstanding examples of American architecture.

Northwestern Floodlighting

The value of Northwestern Terra Cotta for floodlighting purposes is unsurpassed. Textures and finishes are designed especially by Northwestern to secure the greatest degree of illumination at the least cost for electric current.

This use of floodlighting has a direct bearing upon the value of Northwestern Terra Cotta structures in color effects—because the beauty of color treatments when illuminated at night is even greater than their charm in the daytime.

Architects or owners who desire more information regarding the use of Northwestern Terra Cotta, and the application of color to building design, are invited to write the Consulting Color Service of The Northwestern Terra Cotta Company, Chicago, St. Louis or Denver.

Product

Denison Load-Bearing Tile.

Patents and License

The manufacture, sale and use of Denison Load-Bearing Tile are licensed under the "Wilson System Bearing Wall Construction" Patented; patents as follows: United States Patents No. 760,774; No. 784,476; No. 1,234,990; No. 1,171,913. Reissue No. 14,414; No. 1,350,399. Canadian Patents No. 151,165 and No. 178,744. Other domestic and foreign patents pending.

Advantages

(1) Two separate mortar beds in every course, both lying in same horizontal plane. (2) Dead air space insulates between these two mortar beds same as body of tile is insulated, thus preventing formation of frost or moisture lines on inside of wall. (3) This air space between mortar beds insures against conduction of moisture through wall. (4) Because of insulated mortar joints, plaster may be applied direct to the tile without the use of furring.

(5) All vertical webs are in perfect alignment to carry all load pressures. This gives a wall the greatest load-bearing capacity. (6) Tile is completely symmetrical, thereby facilitating laying. (7) It is a complete unit which will stand on its own base in a stable condition when stood on either face or end, thus facilitating handling and piling.

(8) Works out to all brick heights and thicknesses and bonds perfectly with any header course from third to ninth. (9) Dimension tile of fractional lengths furnished to facilitate laying any length of wall. (10) Furnished with scored or smooth face, as ordered.

(11) Corner tile permit turning inside or outside corner without destroying insulating efficiency of wall at corners.

(12) Jamb and half-jamb tile are furnished for either casement or box frame openings, which provide weatherproof joints with the frames and maintain the insulating efficiency of the wall.

Strength

These tile are guaranteed by the various manufacturers to have a minimum crushing strength of not less than 700 lbs. to the sq. in. net area of web section. Laboratory tests, made for the various manufacturers by such recognized testing laboratories as the following, show a crushing strength per tile ranging from 120,000 to 193,750 lbs.: Iowa State College; State Universities of Iowa, Minnesota and Wisconsin; Carnegie Institute; Drexel Institute; Pittsburgh Testing Laboratory; Department of Buildings of Minneapolis and Detroit.

Costs

Construction costs will vary somewhat, due to such local problems as freight rates; yet, in general, practice indicates that it is safe to say that a given wall can be built of these tile at a cost that is 20% to 30% less than the cost to build the same wall of common brick, and the same price as to build it with common tile.

Specifications and Details

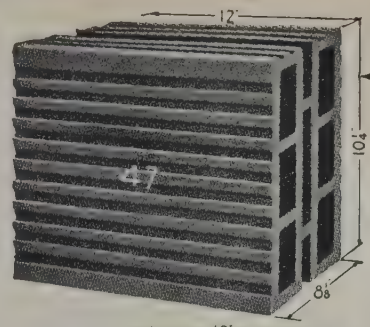
The following may be used as standard specifications for the use of these tile in "Wilson System Bearing Wall Construction":

Denison Load-Bearing Tile shall be laid with the voids horizontal except for corners, jambs, piers or pilasters; all vertical joints shall be staggered and the tile above should overlap the tile below by at least 3 in. When the wall thickness is greater than that of the tile, it shall be constructed of a combination of whole and half thickness units, spaced apart from each other the distance of the void between the two lobes of the whole tile, and the next whole tile above shall bond two subadjacent tile below together by overlapping two bearing webs of each, retaining all bearing webs in alignment. Where joists rest on the wall they shall extend into same so that they will overlap at least two bearing members of the tile. Where wall heights do not work out to even courses of the tile being used, a smaller unit shall be used to complete the height. Dimension lengths, which are furnished in sufficient quantities, shall be used to complete lengths of walls and between openings, etc.

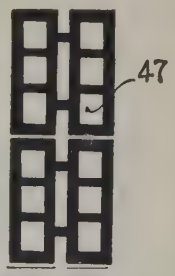
Working Drawings

A portfolio, containing a full set of detail and working drawings and standard specifications furnished free on request made to any licensed manufacturer.

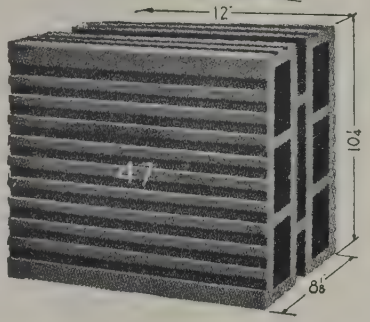
Continued on next page

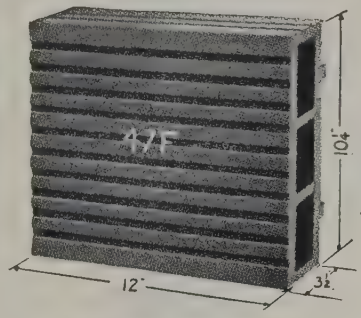


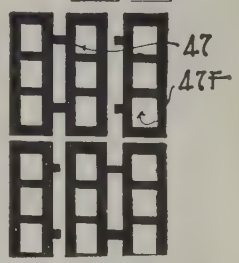
← THESE ——— BUILD ——— THESE →



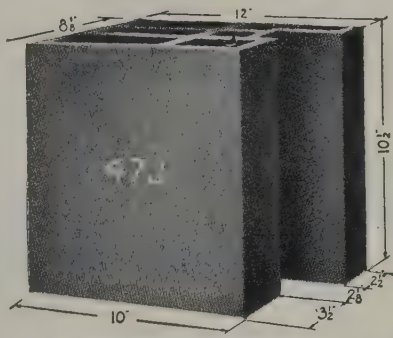
The No. 35 or the No. 23 and their allied units may be used in the place of, or in connection with, the No. 47 and its related units in this or in any of the other constructions shown here. In this way any desired height of wall can be reached that may be reached by using common brick.

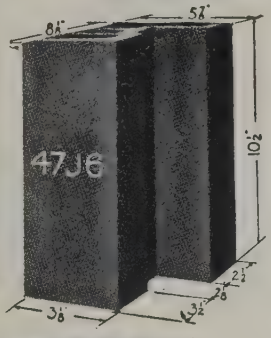


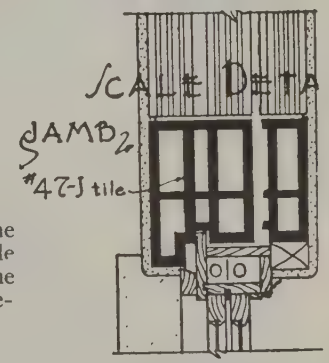




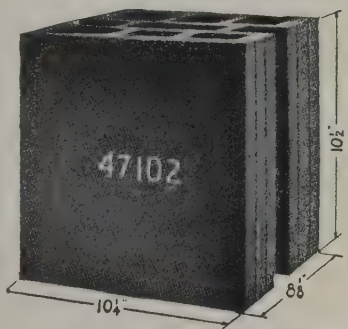
An "F" tile is, in reality, one of the two lobes of either a No. 47, a No. 35 or a No. 23. It may be furnished ready split, or it can be split from the full standard unit on the job.

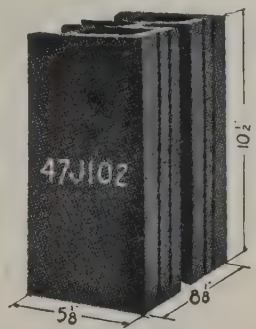


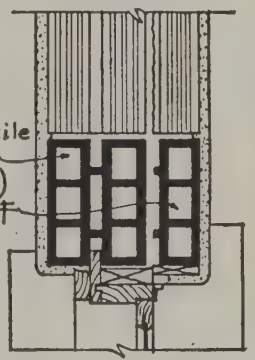




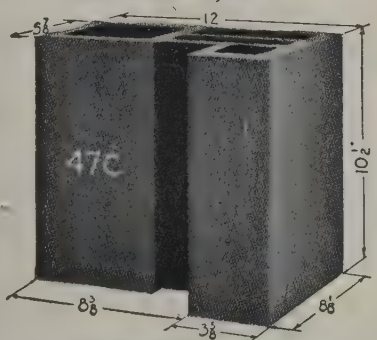
The "J" and "J6" units in the different sizes make possible weatherproof joints between the wall and a box frame without destroying the wall insulation.



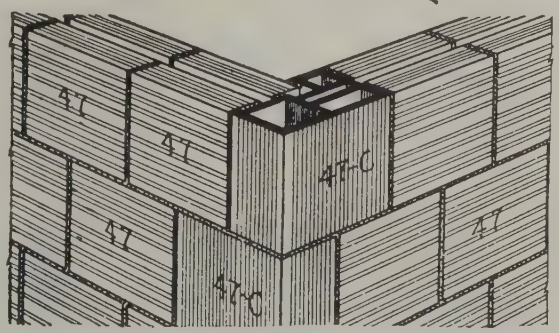


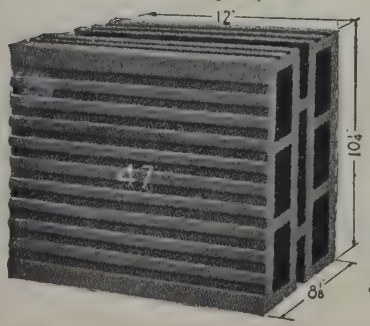


These units in the different sizes make weatherproof joints between the wall and casement frames without destroying the wall insulation.

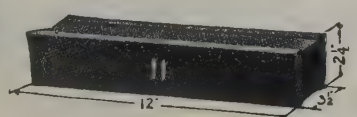


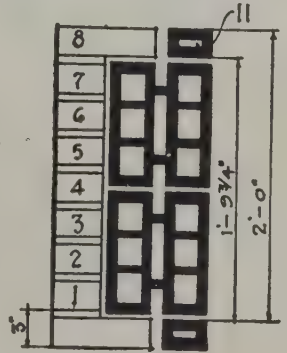
This corner unit enables either an inside or an outside corner to be turned without destroying the wall insulation. It bonds the two walls together into a strong and rigid corner.





The No. 11 is a hollow unit for backing up header courses of brick and maintains both the insulating and the load bearing efficiency of the wall.



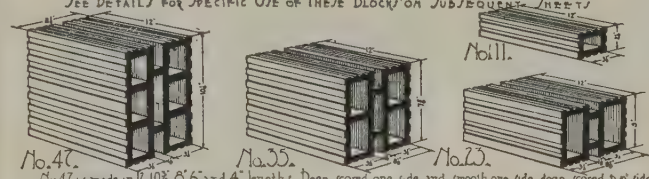


Construction Details of Load-Bearing Tile

Continued on next page

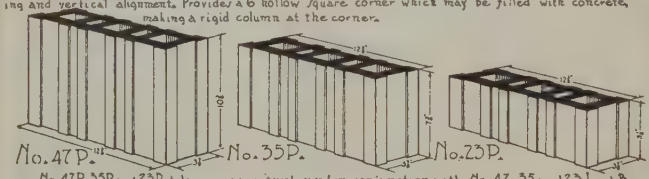
LOAD-BEARING TILE

See Details for Specific Use of These Blocks on Subsequent Sheets

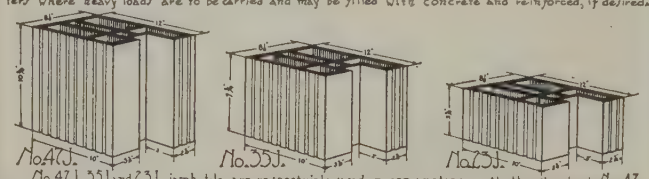


No.47 is made in 12, 10⅔, 8, 6 and 4" lengths. Deep scored one side and smooth one side, deep scored two sides or smooth two sides. No.35 and No.23 made in the same lengths with the same scorings, except 10⅔ length. No.47 is the standard unit, while the No.35 or No.23 may be used if desired, their principal use is to arrive at specific brick heights. No.11 is intended for the same purpose and is made only in 12" lengths.

No.47C, 35C and 23C tile are respectively used in conjunction with No.47, 35 and 23 Load-Bearing Tile. They close and turn corners forming perfect bond and retaining all vertical webs in bearing and vertical alignment. Provides a 6" hollow square corner which may be filled with concrete, making a rigid column at the corner.



No.47P, 35P and 23P tile are respectively used in conjunction with No.47, 35 and 23 Load-Bearing Tile. They are used for forming casement frame jambs and half jambs, also columns and pilasters where heavy loads are to be carried and may be filled with concrete and reinforced, if desired.



No.47J, 35J and 23J jamb tile are respectively used in conjunction with the standard No.47, 35 and 23 tile and are made in a 6" length in addition to the 12" length shown.

P. BANNON PIPE CO.

Hollow Tile Fireproofing and Patent Lidded Pipe

LOUISVILLE, KY.

Products

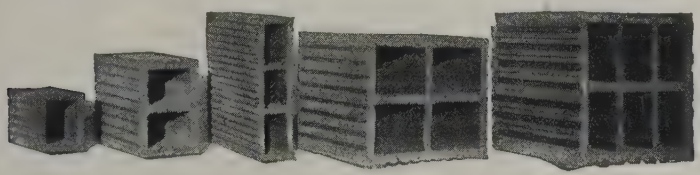
HOLLOW TILE FIREPROOFING; SHALE BRICK; FIRE BRICK; WALL COPING; FLUE LININGS; CHIMNEY TOPS; SEWER PIPES; PATENT LIDDED PIPE and EXPANSION PIPE SUPPORTS.

Also, Vitrified Culvert Pipe; Drain Tile; Glazed Conduit Pipe (for underground work); Vitrified Paving Brick and Blocks; Boiler and Grate Tile.

Hollow Tile and Shale Brick

Hollow Tile—For fireproofing of every description. Made of shale. For partitions and furring tile, 1½ to 16 in.; building tile, 6-cell and 9-cell, 6 to 12 in.; book tile, back up blocks; column covering; standard arch floor tile, 6 to 16 in.

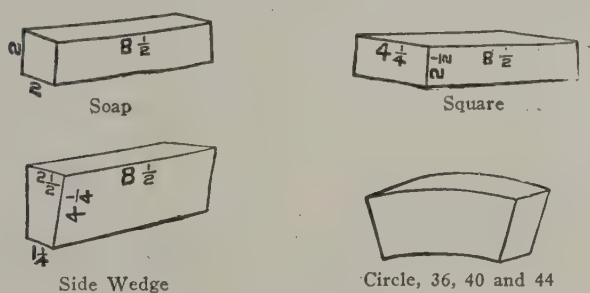
Shale Brick—Are manufactured hollow; with rough texture face, and common.



HOLLOW TILE SIZES

Fire Brick

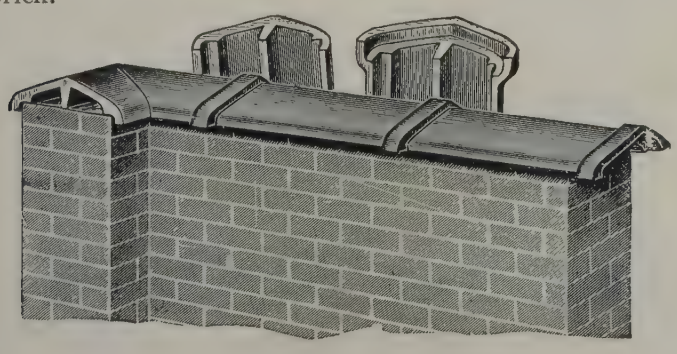
All shapes and sizes.



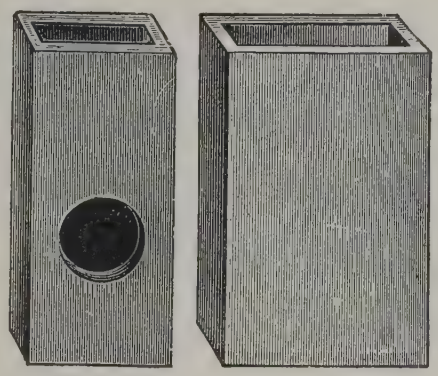
FIRE BRICK SIZES

Wall Coping

Made of best fire clay and shale, thoroughly vitrified, glazed to render surface as smooth as glass. Tile is shaped to fully cover wall, protecting same from action of the elements; also secures the top course of brick.



WALL COPING, HIP SHAPE
With or without rib



8½ x 13 in., pipe hole — 13 x 13 in.

FLUE LININGS

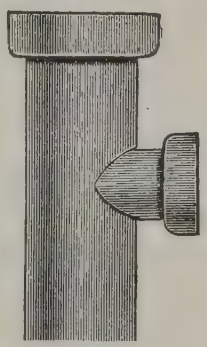
No. 14
CHIMNEY TOP

Sewer Pipe and Fittings

Made of vitrified salt glazed fire clay and shale.

The salt glazed surface, being smooth, clean and impervious, protects pipe and fittings from dampness, frost, all acids and sediments.

It is durable, low in cost, convenient for construction, and because of its smooth glazed surface has greater carrying capacity than any other material. It can be laid by unskilled labor.



SEWER PIPE
T-Branch

LIDDED PIPE
For conducting steam and water pipe

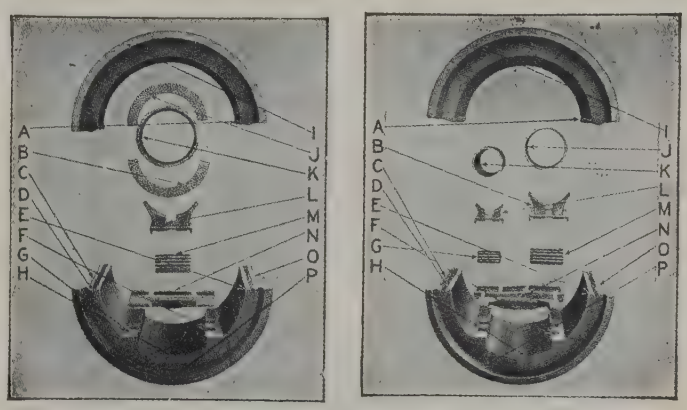


Plate E, Single Line — Plate F, Double Line

DETAIL OF CONDUIT

Reference letters point as follows:

Plates E and F—A, reinforcement inside along score cut on both sides of lid half; C, outer open scores; D, trenchlike fracture; E, inner open scores; F, support anchoring pocket; H, drainage space; I, hub of lid half; O, cement shelf and outer reinforcement at each side of lower half; P, hub of lower half.

Plate E, only—B and J, standard covering; K, 6-in. iron pipe; L, saddle receiving K, direct; M, 4⅛x2-in. toothed roller (meshes in rack of saddle and cradle); N, No. 15-F-15 cradle (the finger supported style).

Plate F, only—B, saddle for main line J; L, saddle for return line K; G, roller for return saddle; M, roller for main line saddle; N, No. 16-P-15-D cradle (the rib supported, boss-anchored style)

CLAY PRODUCTS COMPANY, INC.

Manufacturers of Ar-Ke-Tex Tile Including Insul-Glaz, Caentile, Cream Gloss and Mottled Tile

GENERAL OFFICE
BRAZIL, IND.

Products

AR-KE-TEX
ART-CERAMIC TEXTURE

TRADE-MARK

AR-KE-TEX TILE including the following:

INSUL-GLAZ TILE (Salt Glazed).
CAENTILE (Smooth and Wire-cut).
CREAM GLOSS TILE.
MOTTLED TILE.

Also manufacturers of Vitrified Glazed Clay Conduit, Building Conduit, Textured Interlocking Tile, Filter Bed Tile and Raggle Block.

Material

In Ar-Ke-Tex Tile it has been our aim to perfect a material for wall construction which combines the many advantages of structural tile with surface finishes, that in quality and appearance are acceptable for the highest class of projects. The following kinds of Ar-Ke-Tex Tile have a common base of vitrified fire clay and differ only in the texture of the finish.

Insul-Glaz Tile—Insul-Glaz Tile is a smooth face vitrified fire clay tile with a uniformly heavy salt glazed finish and of a color most desirable in this class of material.

Caentile—Caentile is a vitrified fire clay tile with colors and textures of the highest grades of buff and gray, smooth or matt face brick.

Cream Gloss Tile—Cream Gloss Tile is a vitrified fire clay tile with a lustrous, cream colored, salt glazed finish.

Mottled Tile—Mottled Tile is a vitrified fire clay tile with a mottled cream brown finish.

Qualities

All Ar-Ke-Tex Tile are made with the aim of attaining super quality. Due to unavoidable vacillations in heat some tile come out of the kiln with slight variations in texture and these are classed as commercial quality.

Super Quality—The standard of perfection of smooth face vitrified tile, glazed or unglazed.

Commercial Quality—A high grade vitrified tile, glazed or unglazed, suitable for many purposes.

Color

Insul-Glaz super quality tile is furnished in either a light, medium or dark shade. A range of shade will be furnished which blended in the wall will have an extremely light effect or a dark effect, as desired, and a ceramic beauty possible only with a slight mingling of shade.

Super Quality smooth Caentile is furnished in blended shades of buff gray or cream buff.

Matt Caentile and commercial grades of Insul-Glaz Tile and smooth Caentile are furnished in full range of shade only.

Cream Gloss Tile and Mottled Tile are furnished in a closely blended range of shade.

While every endeavor is made to furnish shapes of the same variations of shade as the standard units, greater latitude must be permitted, particularly on rush shipments.

Construction Features of Ar-Ke-Tex Tile

Ar-Ke-Tex Tile have many advantageous construction features. Among them the following stand out: fire, acid, oil and grease resistant; insulation quality; sanitary finish; high crushing strength and low dead weight; indestructibility; attractiveness of finish; economy and rapidity of erection; permanency of color and finish; readily cleaned; minimum upkeep; low relative cost.

Some of the Principal Uses

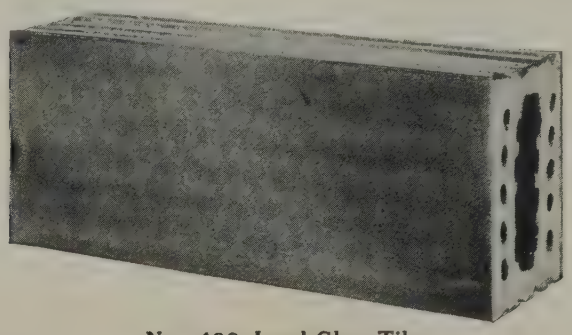
Among the principal uses of Ar-Ke-Tex Tile are: finishing rooms of public or semi-public buildings where one or more of the construction features listed above are a necessity. School buildings—particularly in corridors, playrooms, workshops, basements, gymnasiums, laboratories, lavatories; for wainscots, etc. Others include hotels, natatoriums, hospitals, food preparation plants, power plants, warehouses, etc.

Facilities and Service

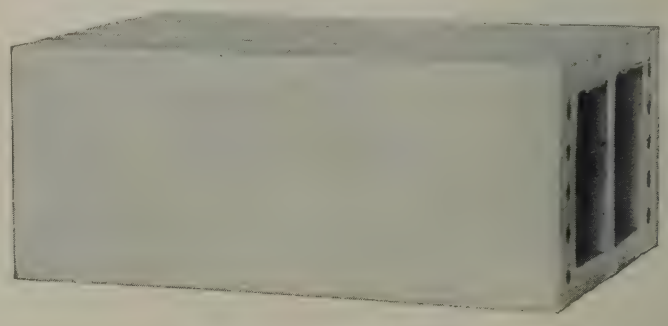
CLAY PRODUCTS COMPANY, INC. operates two plants with a combined capacity in excess of 125,000 tons per year. The plant locations are such that shipments can be made over any one of four trunk line railroads. Ample stocks of standard units are always on hand for prompt shipment.

The Company maintains an engineering department which is ready at all times to render assistance to the architect, engineer or builder in the solution of construction problems where Ar-Ke-Tex Tile may be involved.

Special sizes or shapes can be manufactured to meet unusual conditions.



No. 400 Insul-Glaz Tile



No. 800 Smooth Caentile

Pertinent Data Regarding Ar-Ke-Tex Tile

Wall Thicknesses Which Can Be Built with Ar-Ke-Tex Units—*Veneer*—1⅜ and 1⅞ in. (exclusive of mortar backing).

Single Faced—3¾ and 8 in.

Double Faced—4¼, 6¼, 8, 10¼, 12¼, 16½ in. and up.

All walls from 4¼ in. may be of one finish of tile on one face and of a different finish of tile on the other face, e.g., a 4¼-in. wall may be Insul-Glaz Tile on one face and Caentile on the other face.

NUMBER OF AR-KE-TEX TILE REQUIRED PER SQUARE FOOT OF NET WALL

Thickness, in., of Veneer tile	Thickness, in., of Wall	Number of faces tile finished	Quantities required per sq. ft. of net wall, using ½-in. joints
1⅜	.....	1-veneer	1.05 No. 350
1⅞	.....	1-veneer	1.05 No. 250
.....	3¾	1	2.10 No. 400 or 1.05 No. 650
.....	4¼	2	2.10 No. 250
.....	6¼	2	1.05 No. 250 plus 2.10 No. 400
.....	8	1	2.10 No. 800
.....	8	2	4.20 No. 400 or 2.10 No. 650
.....	10¼	2	1.05 No. 250 plus 2.10 No. 800
.....	12½	2	2.10 No. 400 plus 2.10 No. 800
.....	16½	2	4.20 No. 800
.....	12¼	1-other face brick veneered; brick header every 6th course	0.70 No. 400 plus 1.40 No. 800 plus 7 face and 1 common brick.

Brick Displacement—Brick displaced by Ar-Ke-Tex Tile equal 5x8x12-in. tile, 6 brick and 5x4x12-in. tile, 3 brick.

Crushing Strength—Approximately 3400 per sq. in. of gross bearing surface.

Absorption—Less than 5% of own weight in 48 hours.

Weight of Wall—Weight of Ar-Ke-Tex Tile walls as compared to brick of equal thickness are given in the following table:

Ar-Ke-Tex-Tile		Equivalent Brick Wall*
Wall thickness, in.	Weight per sq. ft., lb.	Weight per sq. ft., lb.
4¼	35	43
6¼	55	84
8	60	84
12½	95	125

*Brick taken at 125 lb. per cu. ft.

Mortar Clinch—The ½-in. round holes in the exterior webs of the tile assure a permanent mortar clinch in the vertical joints of the tile wall, an important factor in exposed tile construction.

Hand Smoothed Edges—All cut edges are hand smoothed, in the green, so that finished faces will be free from any roughness or featheredges, which are not only unsightly but cause chipping.

Mortar and Mortar Color—Ar-Ke-Tex Tile may be laid in any kind of mortar made according to good practice with joint size and color to suit the individual taste of the architect or his client.

Double Faced Walls—It is not recommended that double faced walls be built of one tile extending through the wall, but rather of two units as shown in details on plates following.

This procedure will permit of alignment of both faces at a cost no higher than would be necessary with two-faced sorting.

Tests—The testing laboratory of the University of Wisconsin has made a series of tests on Ar-Ke-Tex Tile (Insul-Glaz and Caentile). Copies of the reports of test will be sent upon request.

The following results of tests on three blocks are taken from one of the certified reports:

TEST ON STANDARD 5x8x12-IN. BLOCK

No.	Strength per sq. in.	*Percent of voids	Weight, lb.	Weight after 48 hr. immersion, lb.
Clay P. C. 4	3950	45.3	20.00	20.15
Clay P. C. 5	3690	44.5	19.02	19.13
Clay P. C. 6	3700	45.4	19.73	19.80

*Not including 10 small round holes lengthwise, 5 in each vertical web.

Sorting, Packing and Shipping

Ar-Ke-Tex Tile are sorted for one face only, except No. 250's, 350's and 650's and shapes which are sorted for faces as marked on details.

Ar-Ke-Tex Tile are packed in the car with extreme care and thoroughness.

Super quality tile of all finishes are individually wrapped in corrugated board. Commercial quality tile are packed with lath gates between tiers; lath and straw between rows and corrugated board between faces.

Shipped by carload lots the minimum loadings are—

No. 800, 5x8x12 in., 3500 pieces

No. 400, 5x4x12 in., 5000 pieces

No. 650, combination 5x8x12 in. and 5x4x12 in., 3000 pieces.

Samples

Samples of any kind of Ar-Ke-Tex Tile will be sent, without charge to architects on request.

When Specifying

When specifying, give kind of material, quality, color range, whether bullnose or square closures, and whether cove base and wainscot cap units are desired.

Patents

The Heath Cube system of construction is completely patented in the United States and Canada. Rights to manufacture and sell under Heath patents in the United States are granted by the Heath Unit Tile Company, Tacoma, Washington.

The Product

The Heath Cube is a standardized hollow tile building unit, cubical in shape, dimensioned according to the established measurement of brickwork. Its size, exactly that of six brick assembled with mortar to form a cube, permits the substitution of Heath Cubes wherever brick has been figured. Strength is provided by complete double-web-and-shell alignment and perfect two-way bond.

The simplified form of construction possible through the use of Heath Cubes brings with it marked economies—in fact, the Heath Cube offers an entirely new and efficient solution to all structural masonry problems.

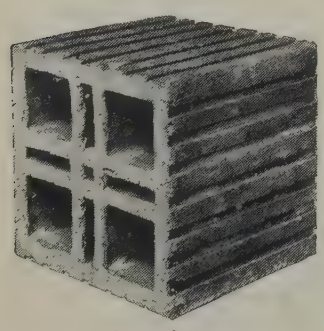
A New Principle in Masonry Construction

It is the universal adaptability of the Heath Cube with its basic brick dimensions that makes it entirely unique as a unit for masonry construction. The easy divisibility of the Heath Cube permits the use of a Header-Cube for brick backup, and Half and Quarter-Cubes wherever proper bonding or structural details may require.

With the Heath Cube it is possible to build an all-tile wall regardless of the number of openings, piers, pilasters, chases or corners. Brick patchwork is entirely eliminated. All elements become an integral part of a complete and perfect tile structure. Incidentally, the complete tile wall, free from danger of efflorescence experienced with brickwork, makes by far the more satisfactory plastering surface.

Economy

The economy of Heath Cube construction begins with the simplicity of the Cube itself. No units are required other than the basic Cube and its fractional parts. The usual 15% to 25% brick patchwork is eliminated. Because Heath Cubes may be either end-set or side-set, there is no slushing of exposed voids with mortar. No special tile shapes are needed. Not only does the use of Heath Cubes result in a saving of material—but it greatly simplifies the operations of the mason. The Heath System is the most satisfactory and the least expensive form of masonry construction.



One Cube
18 pounds

Strength

Two exclusive and unique features give to Heath Cube masonry its great strength. First, whether in side-set or end-set construction there is always fixed double-web-and-shell alignment. Since vertical joints are approximately the same width as the space between the double webs, direct vertical alignment of webs and shells results. It would be impossible to build a properly bonded wall without this complete alignment. A perfect two-way bond, eliminating continuous vertical joints, is the second vital factor contributing strength.

Quality Standards

Manufacturers have been selected to make Heath Cubes on their ability to produce high quality products. The required quality conforms to the specifications of the Hollow Building Tile Association and of the American Society for Testing Materials. Heath Cubes are of a uniformly high quality throughout the United States.

Design Data

120 lb. per sq. in. gross area, is the safe working load for either side-set or end-set construction.

Webs and shells are ⅝ in. thick. The Cube contains 52% solids and 48% voids.

One cubic foot of Heath Cube masonry weighs 63 lb.

Heath Cubes—Forms Supplied

Heath Cubes are furnished in either whole or factional units as illustrated on the next page. Ordering a sufficient number of Header-Cubes will save time and possible waste on the job. Since two Half-Cubes can be set in place of one whole Cube it is advisable to make your estimate on this shape generous. Quarter-Cubes can be split from Half-Cubes as needed. In any case the whole Cube is always divisible into any shape on the job.

Cubes are ordinarily furnished with all four faces scored. Where desired however, they may be obtained with one or more faces smooth or with texture surfaces.

Architect's Handbook

Complete details, specifications, and full information on Heath Cube masonry have been assembled in convenient reference form. Write the Heath Cube Service, Incorporated, or your nearest distributor for a copy of the Architectural Handbook on Heath Cube Masonry. It is fileable.

Miniatures

Miniature Heath Cubes are available for studying and planning details of construction. Architects desiring these should address the nearest Heath Cube distributor.

Six Brick
30 pounds

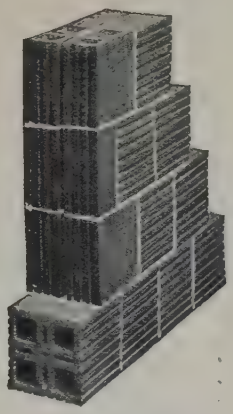
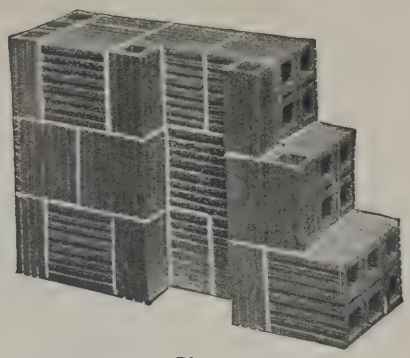
Junctions

This shows an 8-in. Cube wall joining a 12-in. Cube wall with perfect bond relation



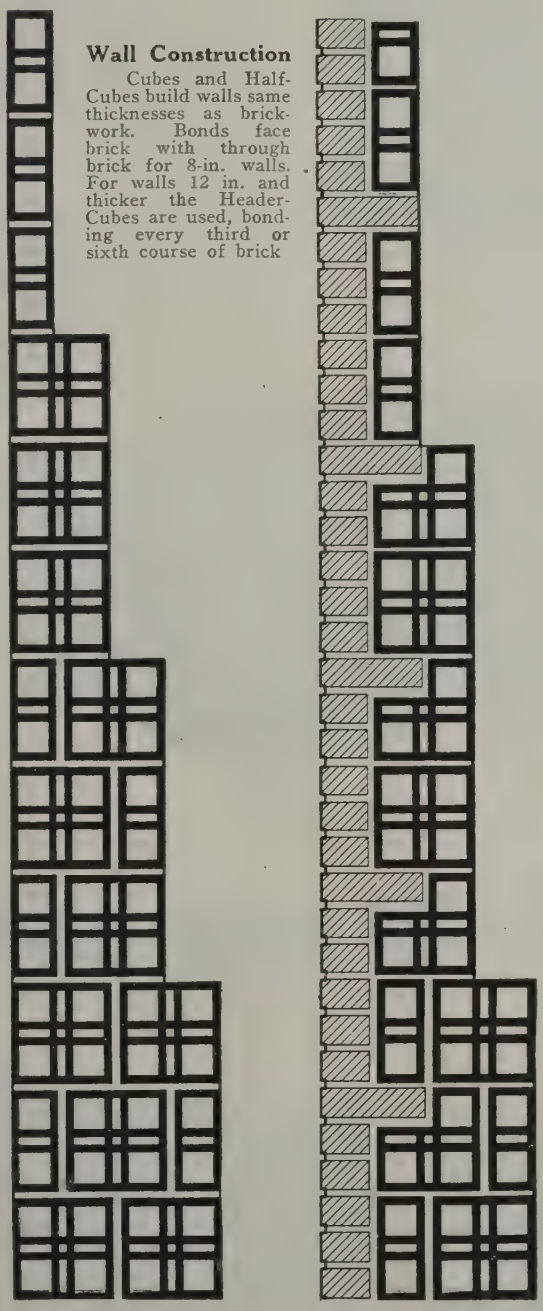
Metal Sash

The adaptability of the Cube is well illustrated by this jamb with a continuous joint in which metal sash may be built without impairing the full strength of the wall structure



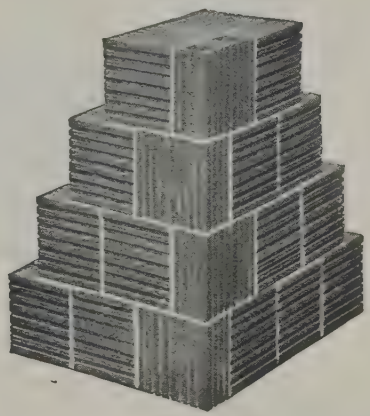
Chases

This shows how a chase may be built into a Heath Cube wall. Notice the absence of open voids and preservation of bond structure



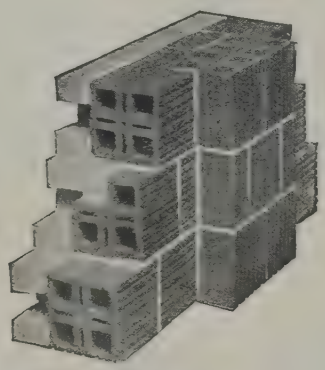
Wall Construction

Cubes and Half-Cubes build walls same thicknesses as brickwork. Bonds face brick with through brick for 8-in. walls. For walls 12 in. and thicker the Header-Cubes are used, bonding every third or sixth course of brick



Corners

Corners for walls of all thicknesses are built by end-setting the Half-Cubes and starting off the whole Cubes in perfect running bond



Backup

In the construction of pilasters and fireproofing around columns, whole Cubes and Half-Cubes bond perfectly with the Cube and Header-Cube backing

Closures

Note how the closures and chase illustrated in this figure are built with a regular Cube and Half-Cube without the use of special shapes or brick patchwork

HEATH CUBE MASONRY CONSTRUCTION

HOOSIER BUILDING TILE & SILO CO.

Glazed Tile for Interior and Exterior Wall Construction

ALBANY, IND.

Hoosier Interior Tile

Made from our light-burning fire clay, burned to an extreme degree of hardness.

Colors—Light or dark buff, gray or cream shades.

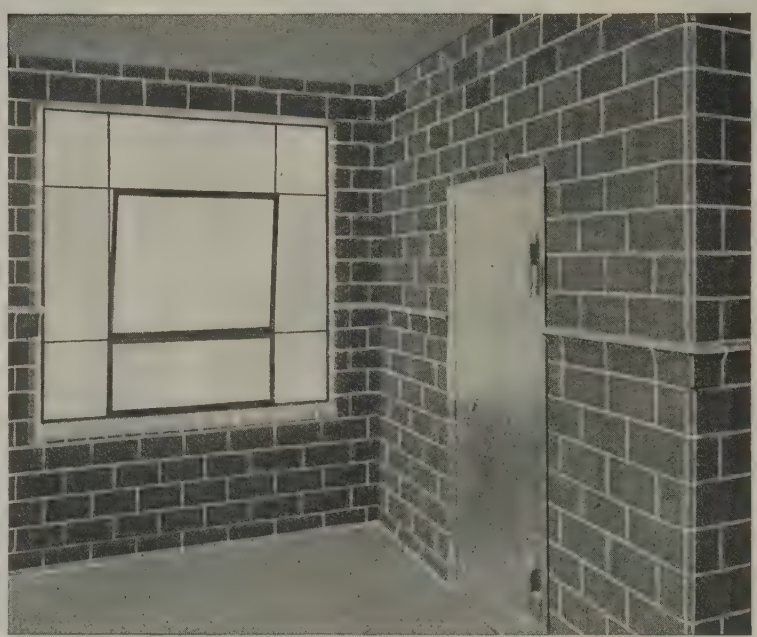
Finish—Smooth or wire-cut glazed, or semiglazed. All smooth finish product for interior wall construction has hand dressed edges.

Size—5x12-in. face. Furnished in 4 and 8-in. widths in regular or scored-to-split designs for working out different thicknesses of wall. (See accompanying illustration of blocks. Details of measurement on following page.)

Uses—The principal use of Hoosier interior tile is for sanitary walls in public and semi-public buildings. In school buildings it is particularly appropriate for corridors, workshops, basements, gymnasiums, laboratories, lavatories, etc., where it is used as wainscoting. This material is also used quite extensively in power plants, warehouses, storerooms, factories, packinghouses, etc. We recommend our light gray and cream colors in the semiglazed finish for use above wainscot or in wall construction where the reflection of glazed tile would be undesirable.

Grading—Hoosier interior tile is graded as "A," "B" and "C" grades. "A" grade is our standard of perfection. "B" grade is a good quality product, not sorted as to shade and admitting of certain mechanical defects not allowable in "A" quality in either the glazed or semiglazed finish. "C" grade consists of culls or, as they are sometimes termed, seconds. (Write for special detailed sheet.)

Loading and Packing—Hoosier interior "A" grade tile is packed with corrugated paper between faces and lath or paper between ends. "B" and "C" grades will be packed in straw unless otherwise agreed on.



Interior Wall of Hoosier Tile

Interior and exterior corners, wainscot cap and base with base in connection with window and door openings. Special shapes can be furnished for Hoosier interior wall tile construction.

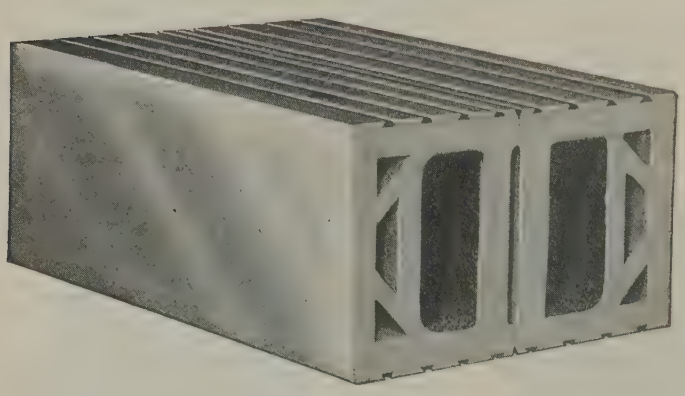
Hoosier Exterior Tile

In light colors it is made from our light-burning clay and in dark colors from our dark-burning clay; thoroughly vitrified and furnished in salt-glazed, semiglazed and dull finish.

Colors—Light or dark brown, gray, cream, wine-black and special mixtures, all of which are designated by shade numbers.

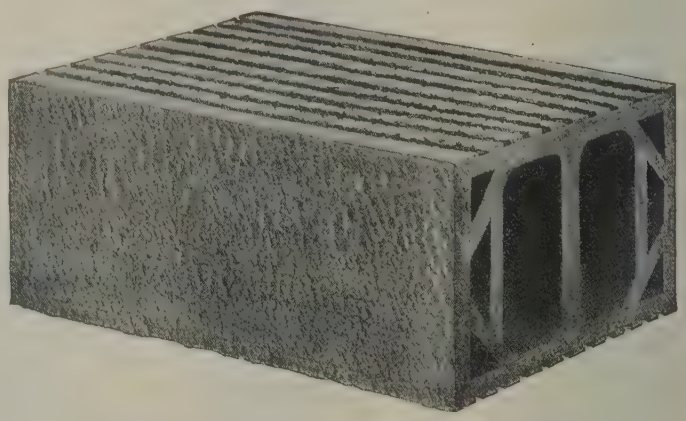
Finish—Smooth or wire-cut glazed, or semiglazed.

Size—5x12-in. face, furnished in 4, 8 and 12-in. widths. (See illustrations at bottom of page.)

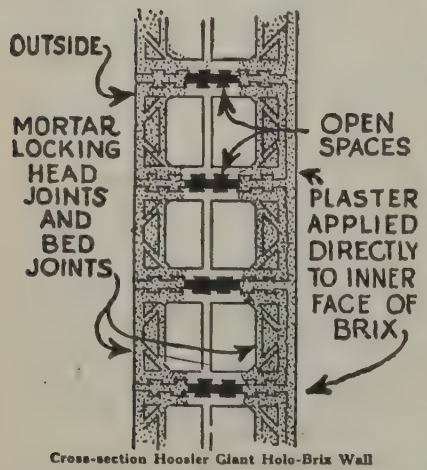


Smooth Glaze 8x5x12-in. Stretcher

Kerfed to make two 4-in. blocks with two finished faces

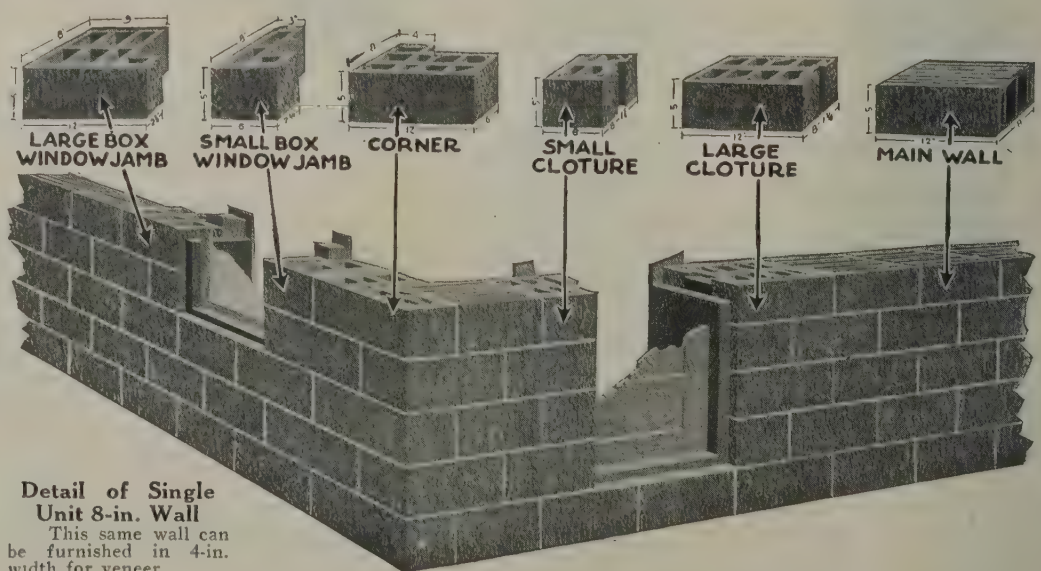


Regular 8x5x12-in. Matt Finish Stretcher



Cross-section Hoosier Giant Holo-Brix Wall

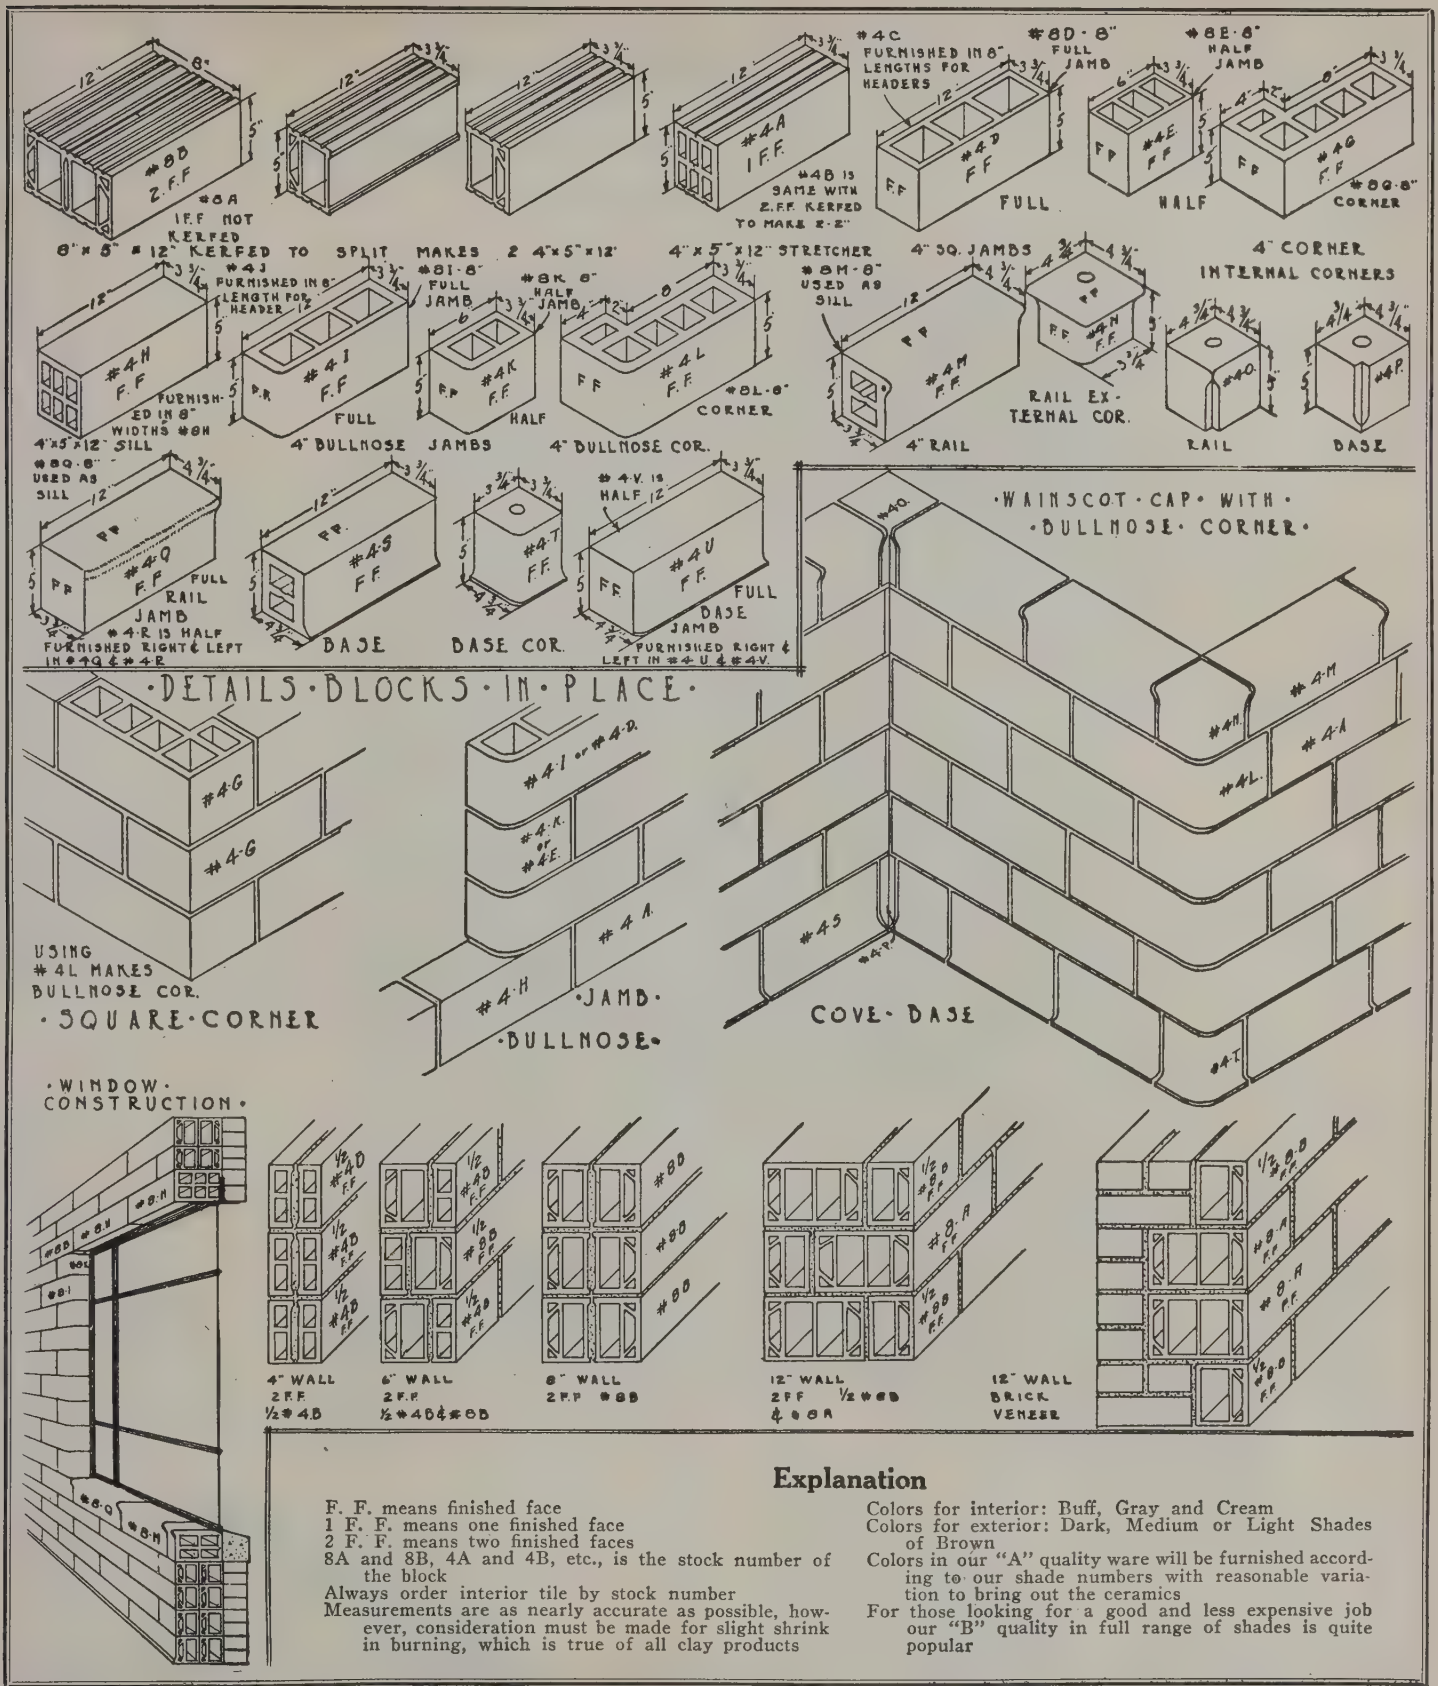
Cross Section of Single Unit 8-in. Wall



Detail of Single Unit 8-in. Wall

This same wall can be furnished in 4-in. width for veneer

Continued on next page



Explanation

F. F. means finished face
1 F. F. means one finished face
2 F. F. means two finished faces
8A and 8B, 4A and 4B, etc., is the stock number of the block
Always order interior tile by stock number
Measurements are as nearly accurate as possible, however, consideration must be made for slight shrink in burning, which is true of all clay products
Colors for interior: Buff, Gray and Cream
Colors for exterior: Dark, Medium or Light Shades of Brown
Colors in our "A" quality ware will be furnished according to our shade numbers with reasonable variation to bring out the ceramics
For those looking for a good and less expensive job our "B" quality in full range of shades is quite popular

Special Shapes for Interior Wall Construction

Uses—Hoosier wire-cut or mat-finish tile is used quite extensively for exterior finished wall in public buildings, such as churches, offices, storerooms, apartments, etc., and also in the more massive type of residence construction. Our smooth-glaze tile, in dark brown colors, we recommend for use in the construction of garages, factories, sidewalls of storerooms, basement walls, or in any class of building wherein line brick or cement block would be considered.

Grading—Hoosier exterior tile is graded as to first and second quality. Our first quality is our standard of perfection in this class of ware and is graded in different shades and blends, all of which are specified by shade number. Our second quality is a hard-burned product. No attempt is made to sort as to shade, and defects are admitted which are not allowable in our first quality. This grade will make a good wall in cases wherein appearance would not be considered.

Loading and Packing—All Hoosier exterior tile is loaded with straw between faces and ends. (Send for special color chart showing shades.)

Construction Features of Hoosier Tile

May be summed up as follows:

A crushing strength of more than 2000 lb. per sq. in., with a moisture test of less than 3%, make the product adaptable to load bearing finished walls. All tile are 5x12-in. face, with proper units to work in connection with openings to make bond. (See drawings.)

Walls can be built in any multiple of 2 in. in width. Our 4 and 8-in. widths are the most popular. The former equals three brick and the latter, six. The unit is of such size that it lays up fast, eliminating unnecessary mortar joints and thereby saving both labor and mortar. As a natural consequence, there is a saving of from 20% to 30%, as compared to brick.

In addition, are the advantages, of a hollow wall for insulation and the sanitary features of a hard-burned, glazed and non-absorbent wall with a load weight reduction of approximately 40% as compared with brick construction—a wall with an appealing and distinctive beauty that very much resembles brick in construction.

HENRY MAURER & SON

Manufacturers of Terra Cotta Hollow Tile Fireproofing

TELEPHONE
ASHLAND 1510

420 East Twenty-third Street
NEW YORK, N. Y.
PLANT, MAURER, NEW JERSEY

Products

"RARITILE" Enclosure Blocks for walls faced with brick. Standard sizes of INTERIOR PARTITION BLOCKS, WALL FURRING, and WALL BEARING BLOCKS.

For Fire Brick, see page C3122.

Quality

Deservedly reputed of best quality and workmanship, true to size and shape, with minimum tendency to breakage.

Facilities

Extensive clay mines adjacent to plant premises, owned, developed and operated by the company; plant located on tidewater in New York Harbor and two railroads (Central Railroad of New Jersey and Lehigh Valley R. R.) insures prompt shipment by boat or rail; motor truck deliveries direct to building give uninterrupted supply for work in progress. Modern and complete machinery and equipment afford ample provision for the largest contract requirements.

Backing Tile

The "Raritile" is a backing system of simple design, and yet possesses every desirable feature sought by architects, engineers and owners. Only one size of block is used, making an ideal construction from a standpoint of permanence, simplicity and economy.

The webs and shells run vertically in perfect alignment, backing up both the stretcher and header face brick, with resultant maximum strength.

The air cells extend vertically the entire height from floor to floor with a continuous uninterrupted cubical air content, which creates absolute insulation as well as a true and complete furring into the wall; dampness can not penetrate as the cement joints are broken by the air cells.

Rigid unyielding support for the header face brick ties them in securely so they can not possibly sway or move out of place.

NATCO PRODUCTS INDEX

INTERIOR WALLS

Natco Vitritile.....Pages 2 to 9 inc.

A particularly attractive load bearing, structural tile for interior walls and partitions—also furnished kerfed or split for furring. Beautifully glazed, sanitary, easily cleaned—eliminates the necessity of plastering or painting.

Natco Partition Tile.....Page 23

Light, strong, easily and economically laid. Fireproof, indestructible, resists the passage of cold, heat and sound.

Natco Furring Tile.....Page 23

Applied to the interior of exterior walls—prevents dampness from penetrating and discoloring plaster.

EXTERIOR WALLS

Natco Vitritile.....Pages 2 to 9 inc.

A particularly attractive glazed load bearing, structural face tile—sanitary—easily cleaned.

Natco Double Shell Load Bearing Tile
.....Pages 10 to 13 inc.

Furnished with 12x12″ scored face for various thicknesses of walls. Double shell construction—resists cold and dampness—provides effective base for stucco.

Natco Triple X Load Bearing Tile....Page 13

Has 12x12″ scored face for different wall thickness. For structures where stucco exterior is desired. Economical, quickly, and easily laid, permanent.

Natco Header Backer Tile.....Page 14

Combined with brick in load bearing and curtain walls. Mechanically bonded, light in weight, substantial and permanent. Meets every brick and mortar joint condition.

Natco Unibacker Tile.....Page 15

Provides effective bond between tile and brick facing. But one unit required for entire wall. Insures rapid, economical construction.

Natco Cubes (Heath Patents)....Not illustrated

Can be furnished on request.

Natco Interlocker Tile.....Not illustrated

Can be furnished on request.

Natco Storage Bins.....Not illustrated

For the storage of coal, grain, ashes, sand, silage and various other materials, Natco Circular Glazed Hollow Tile Storage Bins, reinforced with steel bands, are recommended for permanence, economy and fire safety. These bins vary in size from 8 ft. in diameter to 30 ft. and can be built 50 ft. in height. Descriptive literature on application.

Natco Face Tile (Tex-Tile)..Pages 16 to 22 inc.

Furnished glazed or unglazed, 5x12″ face for 8″ walls. Attractive texture face in several beautiful color ranges. Double shell construction. For residences, office and commercial buildings, etc.

Natco Face Tile (Combed Face)
.....Pages 16 to 22 inc.

Glazed 5x12″ combed exterior face—interior smooth, sanitary, easily cleaned. For 6 and 8″ walls. (Also furnished unglazed when desired.) Double shell construction. For industrial and factory buildings, etc.

FIREPROOFING

Natco Girder and Column Covering
.....Pages 30 to 32 inc.

Well burned Natco Hollow Tile has no equal as a covering for structural steel or iron—is best nonconductor of heat—is not destroyed by fire or water—all necessary shapes and sizes furnished.

FLOORS

(Also adapted to flat roofs)

Natcoflor.....Pages 24 and 25

Combination of special shaped Natco Tile with 2″ wide reinforced cement grout joints. Saves dead load, floor depth, labor costs and insurance—all tile ceiling.

Natco Flat Arch Floors.....Pages 26 to 28 inc.

Afford great strength and fire safety with minimum weight. Can be laid winter and summer because they require no concrete fill or costly forms. All tile ceiling.

Natco Combination Floors—(Standard One and Two Way Systems).....Page 29

Adapted for all classes of buildings where long span fireproof floors are required without beams showing in ceilings. Reduces dead load and provides a good plastering surface.

Natco Segmental Arch.....Page 25

Strongest and most economical type of floor possible. Particularly adaptable for warehouses, lofts, factories, sidewalks or where great strength is required and a flat ceiling is not necessary.

ROOFS

(See also Floors above)

Natco Book Tile.....Page 28

A permanent, non-spalling roof of high insulating value due to the enclosed air spaces. Particularly adapted for glass factories and similar structures—also for buildings where a light, pitched roof is required.

NATIONAL FIRE PROOFING COMPANY

Manufacturers of Natco Hollow Tile

Fulton Building

PITTSBURGH, PA.

BRANCH OFFICES

NEW YORK	CHICAGO	PHILADELPHIA	BOSTON
Flatiron Building	Builders Building	Land Title Building	Textile Building

IN CANADA: National Fire Proofing Co. of Canada, Ltd., TORONTO, ONT.

The Company

Established in 1889, the National Fire Proofing Company has been in business continuously since that time. It is the only concern in the world manufacturing a complete line of structural clay products.

Beside the branch sales and service offices listed above, the company also operates as contractors for fireproof construction in hollow building tile in the Chicago district.

TRADE NATCO MARK

Facilities

The total production of the National Fire Proofing Company approximates a million tons of structural clay products annually. This production comprises hollow building tile to meet every building need.

The company operates twenty-two plants in seventeen different localities, in close proximity to the principal tile markets of the country. In addition, it operates a plant in Hamilton, Ontario. It owns or leases over 5000 acres of clay deposits. It is estimated that the deposits thus controlled contain not less than 56,000,000 recoverable tons of clay, which, at the normal rate of operation, is sufficient to last more than fifty years.

Reliability

The rating of the company in Dunn and Bradstreet, together with its long record of fair dealing with its customers is the best possible guarantee of its dependability and stability.

Branding

All hollow tile manufactured by the National Fire Proofing Company is branded with the trade mark name "NATCO." Special types bear, in addition, marks of identification, such as Natco XXX, Natco Header Backer, Natco Unibacker, etc. All tile intended for load bearing walls is so branded.

The Product

Natco Hollow Building Tile is made from special clay, found only in certain favored localities. This clay is mined and moulded into scientifically designed shapes that provide maximum strength and durability with a minimum of weight. These shapes are dried, then placed in large kilns where they are exposed to a temperature of over 2000 degrees varied to suit the structural or non-structural use of the ware.

The Complete Natco Line

Natco, The Complete Line of Hollow Building Tile, comprises units to meet every building need in structures of every kind.

You have a single source of supply, backed by one united, uncompromising responsibility. Along with the tremendous production facilities of the company, you have the stability, the experience and the practical knowledge of the needs of the field that has come with over forty years in business.

Engineering Service

The company maintains an adequate and efficient Engineering Department. This department is anxious to co-operate and show you how you can most economically and satisfactorily use Natco Hollow Tile to the best advantage in every type of construction.

ADVANTAGES OF NATCO HOLLOW TILE

Permanence

Made of selected clay, cured and burned under the careful supervision of graduate ceramic engineers, Natco tile is permanent in form and structure. It is unaffected by heat, cold, dampness and chemicals—never warps or disintegrates.

Strength

Natco Tile is scientifically designed for the purpose to which it is to be applied. The aim is to obtain maximum strength, with minimum weight.

Minimum Weight

Natco Hollow Building Tile, while equal or superior to other materials in strength, insulating qualities, and fire safety, affords through its lightness considerable savings in dead load as well as in steel and foundation costs.

Insulating Qualities

With Natco Hollow Tile, the enclosed dead air spaces provide positive insulation against rapid changes in temperature. In wall construction where any of the types of double shell tile are used, the double shell construction itself, with its wide non-continuous mortar joints, together with the moisture stops at each end acts as an additional barrier against the passage of cold, heat and moisture.

Due primarily to its insulating qualities, Natco Hollow Tile has no equal as a covering for steel. In floor construction, its insulating qualities give it a distinct advantage over other types of floors.

Fire Safety

Made of raw material—clay—which is absolutely non-inflammable, and then exposed during manufacture to over 2000 degrees of heat, Natco Tile is obviously fire-resistive. Its rate of heat transfer is very low, so that it is the ideal material to shield steel work in skeleton buildings.

Soundproofness

Due to the dead air spaces which resist the passage of sound, walls and floors of Natco Hollow Tile are more nearly soundproof than any solid structural materials.

Installations

So many outstanding buildings all over the country have been constructed of Natco Hollow Tile, that it is out of the question to give even a partial list. In thousands of public buildings, skyscrapers, hospitals, schools, institutions of all kinds, residences, industrial and commercial buildings, and other types of buildings, Natco Hollow Tile has been used and is giving perfect satisfaction.

Distribution

Natco plants are strategically located near the principal tile markets of the country. Wherever possible, orders are placed with those plants most advantageously located in order to make savings in transportation charges.

Shipping

Natco Tile are loaded by experts, under close supervision, assuring that the cars will come through with a minimum of breakage. On material such as Vitritile, cardboard wrappers are used, to assure arrival in first class condition.

Single Source of Supply

Instead of buying wall tile one place, floor tile another, you can—by using Natco—fill all tile needs from a single source of supply. Shipments may be better arranged to suit your needs, car load lots may be made up instead of expensive partial shipments and all responsibility will rest with one company.

Continued on next page

NATCO VITRITILE

General

Natco Vitritile is an extremely attractive glazed structural fire clay tile for use in both interior and exterior load bearing and non-structural walls and partitions. It is made with one or both faces glazed and kerfed or split for furring in a multiplicity of standard sizes and shapes to suit practically every condition and dimension. In the 8" thickness the tile is furnished with one good face only. Requires no plastering, painting or similar maintenance. (Can be furnished unglazed on special order.)

Color

Made in four (4) standard shade blends (Nos. 50, 55, 75, 90) ranging from a light cream buff through the yellow and orange buffs to a rich brown.

Combinations of the various shade blends are most harmonious and practical. A "Full Range" blend of shades Nos. 50, 55 and 75 is standard. Combination No. 105 consists of a blending of the lighter shades Nos. 50 and 55. Combination No. 130 consists of a blending of the medium shades Nos. 55 and 75. Shade blend No. 90 (rich brown) is used for color accent in base, trim, etc. Special selections of individual shade ranges (No. 50, 55 and 75) can be made at an additional cost.

Quality

All tile shipped are true to shape, without warpage or surface imperfections. All Natco Vitritile are packed in corrugated wrappers to prevent injury in handling and shipping.

Sanitary

The tile surfaces are entirely unaffected by dirt, grease, chemicals and heat—thus are thoroughly sanitary to the highest degree.

Adaptability

The field for use is unlimited. It is ideal for walls and wainscots in laboratories, schools, restaurants, hotel kitchens and supply rooms, hospitals, gymnasiums, natatoriums, corridors, sub-stations, subways and subway stations, public comfort stations, lavatories, shower rooms, garages, abbatoirs, basements, etc.

Directions for Ordering Shapes

Short Lengths—All numbers under shapes in which short lengths are furnished, denote 12" lengths. When ordering shorter lengths give this same number with length wanted. For example, if a 3" length of V-400 is wanted, mark V-400-3", or, if the half or 5⅞" length be desired, order V-400-6".

3¾" Corners, Jambs, Cove Base and Wainscot Caps, etc. (Shapes V-420, V-426, V-430, V-436, V-4100, V-4110, V-4120, V-470 and V-480) will be furnished scored on one side for use with shape V-890 in 3¾" partition plastered on one side when so ordered. Be sure to specify whether external or internal side of corners are to be scored.

When ordering corners (Shapes V-4100, V-4110, V-4120, V-C4700, V-C4710, V-C4720, V-C4800, V-C4810 and V-C4820) of select one face material, do not fail to specify whether the select face is internal or external.

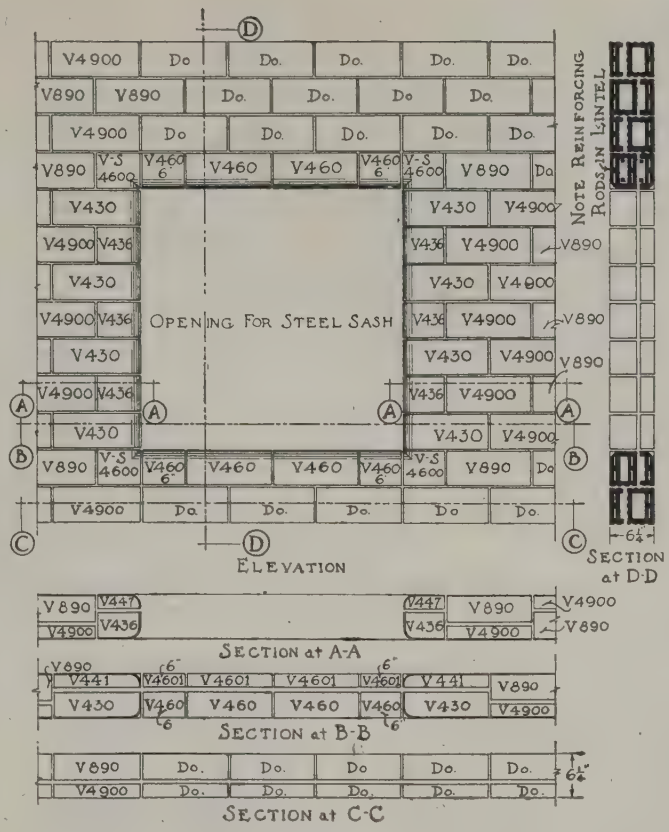
Height Table

Tile { 3¾" x 5" x 12" / 8" x 5" x 12" }
Joints ¼"
For ⅜" Joints, see Page 19

Course No.	Height
1	— 5¼"
2	—10½"
3	1'— 3¾"
4	1'— 9"
5	2'— 2¼"
6	2'— 7½"
7	3'— 0¾"
8	3'— 6"
9	3'—11¼"
10	4'— 4½"
11	4'— 9¾"
12	5'— 3"
13	5'— 8¼"
14	6'— 1½"
15	6'—6¾"
16	7'— 0"
17	7'— 5¼"
18	7'—10½"

The table above is used to determine the heights of walls which will best lay up without cutting tile, using ¼" bed joints. For instance, should you desire to build a wall 7' 0" high you will note that it will require 16 courses.

By varying the thickness of the mortar joints these dimensions may be slightly changed.



Treatment of openings in 6" Natco Vitritile Partition for steel sash. Illustration shows use of Bullnose Sills, Lintels and Jambs.

Length Table

Tile { 3¾" x 5" x 12" / 8" x 5" x 12" }
Joints ¼"
For ⅜" Joints, see Page 19

No. Tile	Length
1	1'— 0"
1½	1'— 6⅛"
2	2'— 0¼"
2½	2'— 6⅜"
3	3'— 0½"
3½	3'— 6⅝"
4	4'— 0¾"
4½	4'— 6⅞"
5	5'— 1"
5½	5'— 7⅛"
6	6'— 1¼"
6½	6'— 7⅜"
7	7'— 1½"
7½	7'— 7⅝"
8	8'— 1¾"
8½	8'— 7⅞"
9	9'— 2"
9½	9'— 8⅛"

The table above shows the length of walls and pilasters that will best lay up without cutting tile, using ¼" vertical mortar joints. For instance, should you desire a wall 9'-2" long you will note that it will require 9 tile.

To find width of openings, add two mortar joints or ½" to each dimension above.

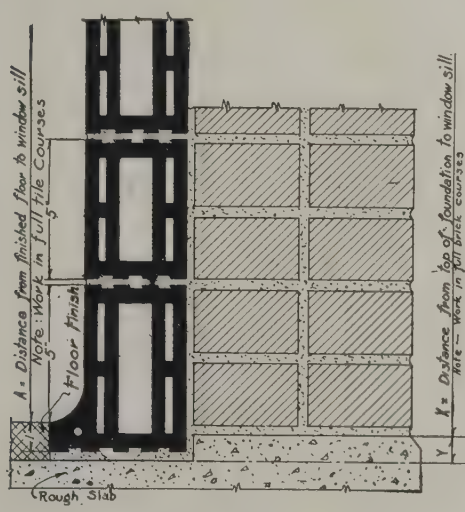


Fig. 1

Suggestions for Starting Natco Vitritile Cove Base from Masonry Foundation

(1) Establish sill height (A) above the finished floor in full courses of tile.

(2) Having sill length (A) and thickness of brick courses, distance (X) can be determined.

(3) With top of foundation fixed, figure distance (Y) to suit thickness of floor finish.

Note: Illustration shows ¼" joints in Vitritile and ⅜" exterior brick joints.

NATCO DOUBLE SHELL LOAD BEARING TILE

General

Natco Double Shell Load Bearing Tile is designed for vertical web load bearing walls to receive exterior stucco and interior plaster applied directly to the tile surfaces. The standard wall units have 12″ x 12″ dovetail scored faces and are furnished in four (4) thicknesses—6″, 8″, 10″, and 12″ to meet the various wall thickness requirements. Beside the standard wall units, complete dovetail scored complementary accessory units are furnished in each thickness for sills, jambs (for both wood and steel windows), lintels, corners, joist closures, joist bearing slabs, joist fillers, etc. to obviate cutting and fitting.

With properly staggered joints all webs are brought into vertical alignment developing maximum wall strength.

Special Feature

The outstanding feature of this tile is the double shell web construction on the two exposed faces which provides a wide, non-continuous, keyed mortar joint on both beds and ends. This non-continuous mortar joint not only permanently seals the outside face cell structure, materially increasing insulation, but most important, it positively prevents moisture passage by capillary attraction from the exterior to the interior.

Advantages

Fireproof—Furnishes the maximum in permanent fire safety.

Low Labor Cost—The completeness of the line speeds erection by obviating the usual cutting and fitting.

Maximum Insulation—The mortar sealed double shell exterior and interior face construction adds materially to insulation, comfort and economy.

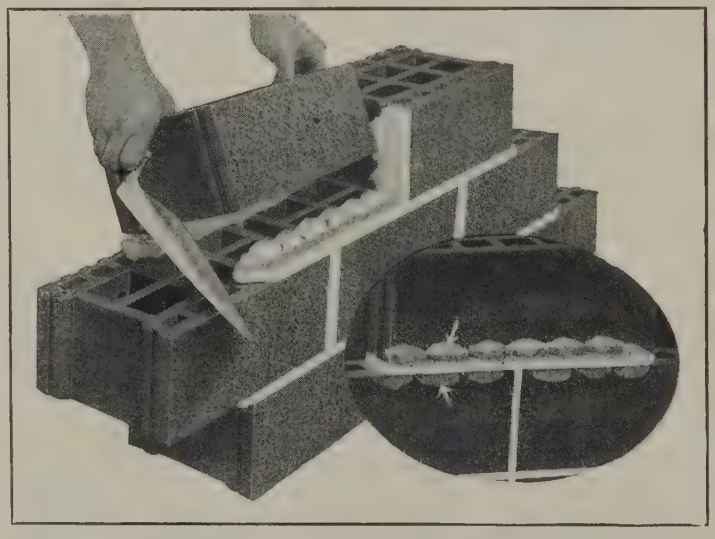
Permanent Stucco and Plaster Base—The dovetail scored tile surface provides the ideal stucco and plaster base.

Prevents Interior Plaster Stains—The non-continuous mortar joints prevent discoloration on the interior.

Ideal for Pipe Installation—The vertical voids furnish provision for pipe chases for conduit and other piping easily accomplished without shattering the tile and with the minimum patching.

Adaptability

Specially adapted to the best class of buildings requiring stucco exteriors.



The illustration shows how the mortar keys into the small cells of the Natco Double Shell type of tile. Note the non-continuous mortar joints which seal the outside cells and prevent transmission of heat and moisture through the wall. (Cut shows Natco Double Shell Face Tile described on Natco Pages 16 to 22 inc.)

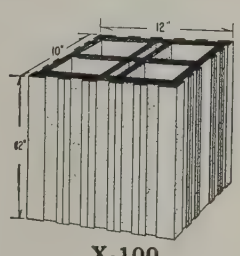
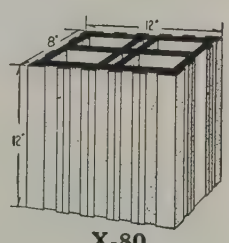
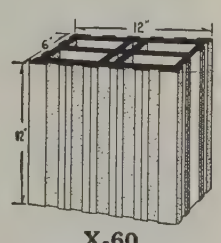
X-120



X-100



X-80



X-60

General

Natco Triple X Load Bearing Tile is furnished for construction similar to that of Natco Double Shell Load Bearing Tile where a lighter weight tile is desired. It is extensively used in the Eastern market.

For construction details, etc., see Natco Pages 10 to 13 inclusive. Triple X construction is identical with Double Shell construction.

Numerical Designation

The wall units and accessory tile shapes are identical in outside dimensions with the Double Shell Load Bearing Tile—substitute the letter X for the letter D in those numerals of the Double Shell series to obtain the Triple X tile of the same dimension. Tiles lettered X in the Double Shell series are the same for both Double Shell and Triple X.

NATCO TRIPLE X LOAD BEARING TILE

Continued on next page

NATCO HEADER BACKER

General

Natco Header Backer Tile is particularly well adapted for exterior load bearing walls faced with brick since the perfect bond every sixth (6th) course between brick and tile allows the full thickness of the masonry wall to be calculated for load carrying capacity.

For brick faced curtain or closure walls in steel or reinforced concrete skeleton construction, Natco Header Backer walls are ideal in point of economy. Due to a reduction of 25 per cent in dead weight over solid brick construction, savings in structural steel run into tons and foundation costs are materially reduced. It is the only tile giving a 10″ wall with an all tile backing.

Western Header Backer

The Western Header Backer is designed structurally similar to the Double Shell Load Bearing Tile and has all its advantages. (See Natco Page 10.)

Eastern Header Backer

The Eastern Header Backer is designed structurally similar to the Triple X Load Bearing Tile. The 1″ shell and web thickness fulfill New York Building Code requirements. (See Natco Page 13.)

Displacement

One (1) 8″ x 5″ x 12″ Header Tile and one (1) 8″ x 12″ x 10½″ Backer Tile including ½″ bed and vertical joints lay up 1.43 sq. ft. of wall surface; or conversely, there are required 700 Headers and 700 Backers to lay up 1000 sq. ft. of wall surface.

Backer Height

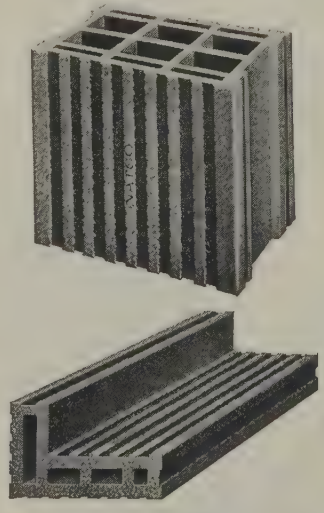
A 10½″ backer is standard and fulfills requirements in the majority of buildings. If necessary, however, the backer tile can be made of a special height to meet any ordinary brick and mortar joint condition.

Advantages

Strength—The perfect 6th course bond with the face brick gives maximum load bearing strength for wall thickness.

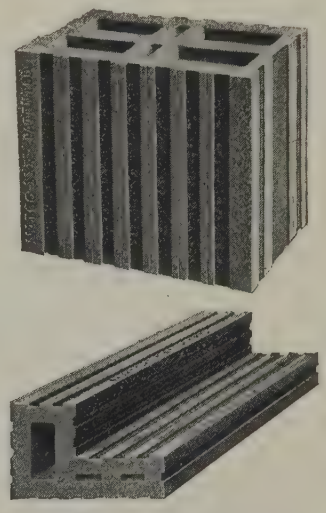
Lightness—Approximately 25 per cent lighter than solid brick masonry walls of equal thickness. The 10″ and 14″ thicknesses are not obtainable in solid brick masonry.

Insulation—The cellular tile structure promotes insulation comfort and economy.



Western Header Backer

Note that the backer tile is similar to Natco Double Shell Load Bearing Tile except in height which is 10½″ instead of 12″. (See Natco Page 10.) Header tile matches the backer tile in web construction

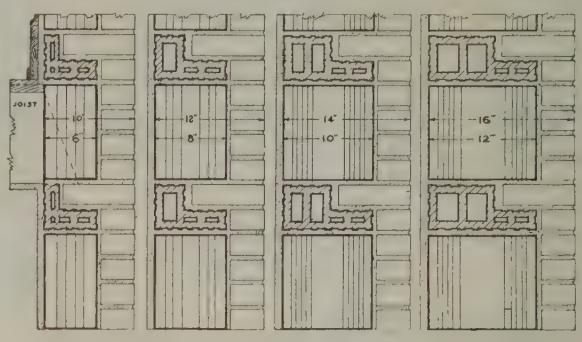


Eastern Header Backer

Note that the backer tile is similar to Natco Triple X Load Bearing Tile except in height which is 10½″ instead of 12″. (See Natco Page 13.) Header tile matches the backer tile in web construction

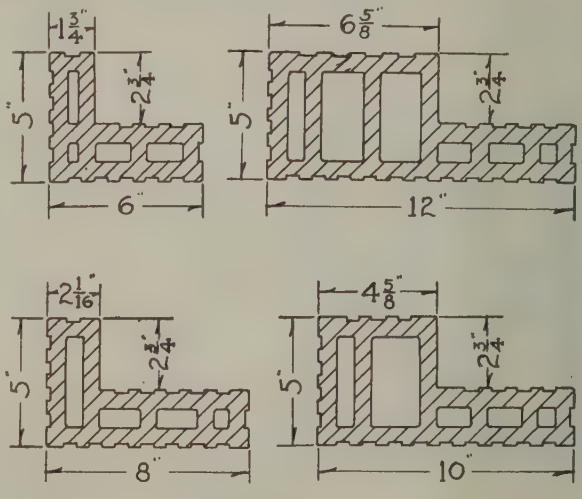
Adaptability

The strong, light Natco Header Backer construction is particularly adapted to use in all brick faced buildings, whether of load bearing or curtain closure wall construction, where the maximum in good construction and economy in labor costs are appreciated.



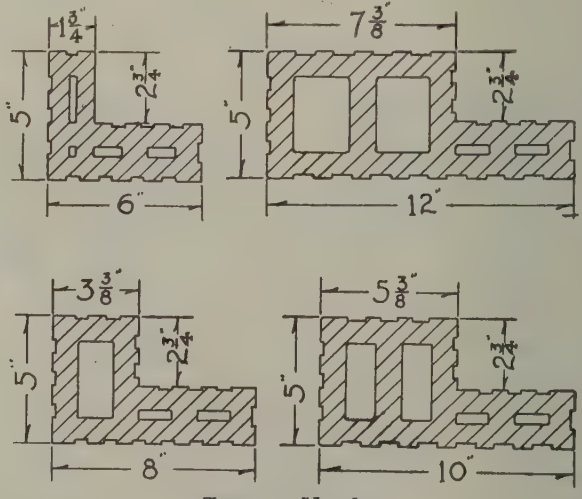
Typical Wall Sections

The standard backer is 10½″ high. While these sections show walls, including brick facing, 10, 12, 14 and 16″ only, thicker walls may easily be obtained by using additional tile



Western Header

The web design matches that of the double shell Western backer tile



Eastern Header

The web design matches that of the Eastern backer tile with 1″ web thickness

NATCO HEADER BACKER

Continued on next page

NATCO UNIBACKER

General

Natco Unibacker is a load bearing unit used in brick faced load bearing or curtain closure walls. It provides a mechanical bond every sixth (6th) course of such strength that full bearing value is allowed on the full masonry wall thickness.

Natco Unibacker can be bonded satisfactorily with Column Covering as three courses of the Unibacker will bond into two courses of the Column Covering.

The Eastern Unibacker is designed with 1" thick shell and webs particularly for the New York market.

Full bearing is provided for floor joists in load bearing walls.

The standard tile is dovetail scored for interior plaster.

Smooth Face Tile

If unplastered smooth tile walls are desired, unscored tile can be manufactured on special order. Adequate notice must obviously be given through our nearest branch office.

Economy of the Single Unit

Unibacker is made in a single tile shape and size which permits great speed of erection and consequent labor economies. This is particularly apparent in long curtain walls without openings.

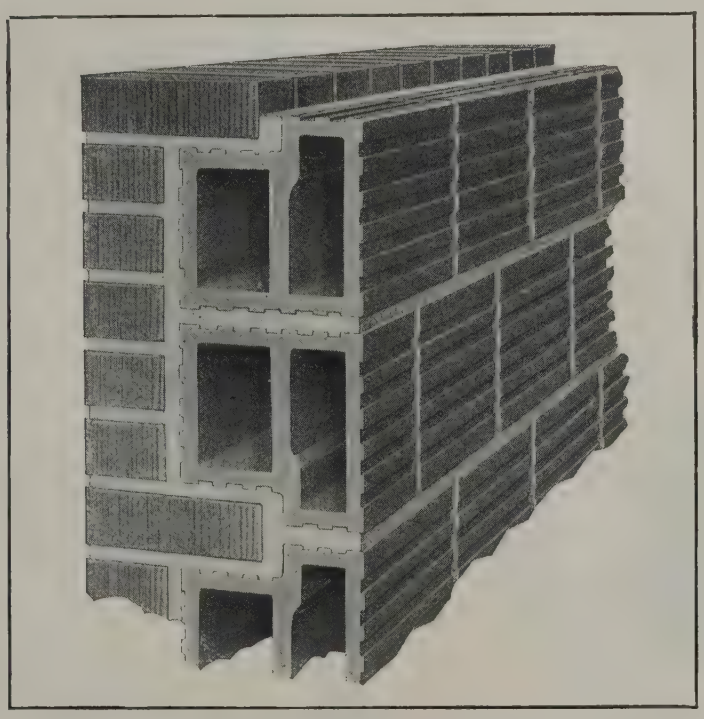
Its weight, compared with solid brick masonry, materially reduces foundation and steel costs without sacrifice of strength and permanence.

Unibacker is particularly economical of mortar. It saves approximately one-third (⅓) over ordinary tile construction.

Displacement

Each Unibacker unit replaces (according to thickness) from 8 to 12 brick, which accounts for the pronounced savings in erection costs and the greater erection speed.

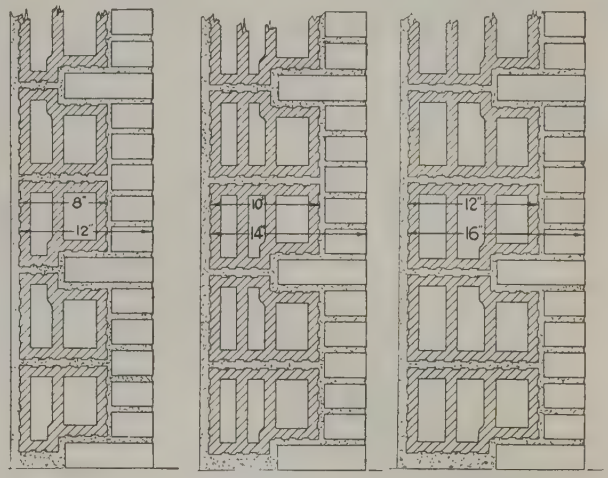
The inner face is 12" x 7¾". Standard thicknesses are 8, 10 and 12" for 12, 14 and 16" walls. Each tile lays up .715 sq. ft. of wall surface when ½" mortar joints are used. 140 units lay up 100 sq. ft. of wall.



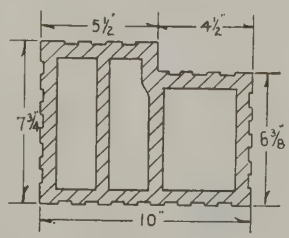
Natco Unibacker Construction
Note the strong, effective masonry bond between the Unibacker tile and brick facing

Adaptability

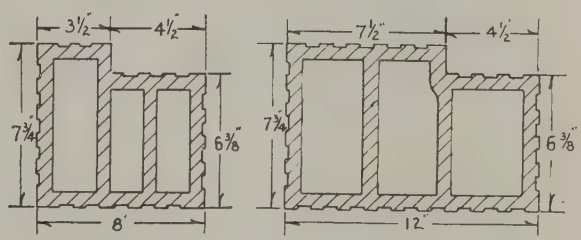
A strong, light construction with speed and labor economies adapting it admirably to use in all types of brick faced buildings of either load bearing or skeleton curtain wall construction.

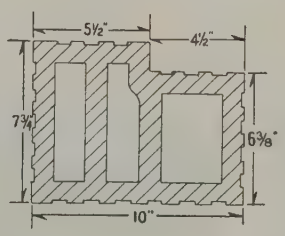


Typical Wall Sections
While these sections show walls including brick facing, 12, 14 and 16" only, thicker walls may easily be obtained by using additional tile

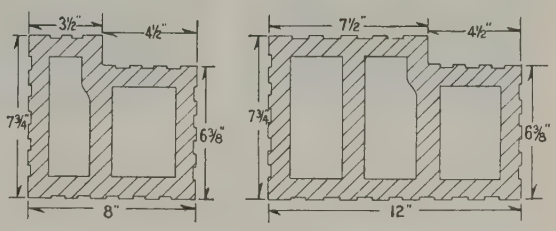


Western Unibacker
Due to the type of clay used the thinner shell and web construction adequately fulfills all load bearing requirements





Eastern Unibacker
This tile is particularly designed for the New York market where 1" thick shell and webs are required



NATCO UNIBACKER

Continued on next page

NATCO DOUBLE SHELL FACE TILE

General

Natco Double Shell Face Tile (Load Bearing) provides a most economical form of masonry construction.

The double shell feature adds to the comfort and strength of the completed structure. A multiple blanket of isolated air cells are located on both the exterior and interior face of the tile forming a barrier to heat transmission. All mortar joints are non-continuous, thus moisture cannot be drawn through by capillary attraction. The voids in the double shell key with the mortar adding strength and stability to the wall. (See also Natco Page 10.)

Each tile laid forms a section of an insulated moisture resisting wall, with an attractively finished exterior face. Upkeep is negligible, as the tile does not discolor, disintegrate or weather—obviously painting or similar maintenance is eliminated.

Each unit is equivalent to six brick, easily and quickly laid, effecting considerable labor and mortar savings.

Made with a 5″ x 12″ face for 8″ walls, complete with all accessory shapes for sills, jambs, lintels, etc.

Unglazed Tex-Tile (Designated by T)

Natco Unglazed Tex-Tile has a texture face resembling a high quality tapestry brick. To meet individual preferences, it is furnished in three (3) color combinations. These are termed Shade Ranges E-1, E-2 and E-3. In Shade Range E-1, the browns predominate. In Shade Range E-3 the reds predominate. In Shade Range E-2 a combination (full range) of Shade Ranges E-1 and E-3 is obtained which is extremely beautiful. The inside face is scored for plaster. (A color chart showing these shade ranges will be sent on request.)

Glazed Tex-Tile (Designated by TG)

Natco Glazed Tex-Tile has the same texture finish as the unglazed and is furnished in dark brownish shades. The inside face is scored for plaster.

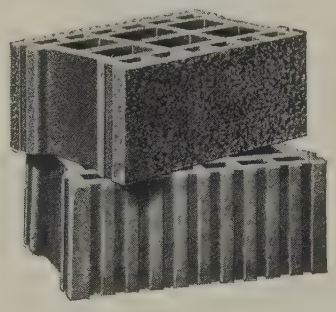
Glazed Comb Face Tile (Designated by B)

Natco Glazed Combed Face Tile has an exterior scratched or combed face and a glazed smooth, sanitary, easily cleaned interior surface. It is furnished in 6″ as well as 8″ thickness.

(When desired, it can be furnished with unglazed, combed exterior and combed interior faces.)

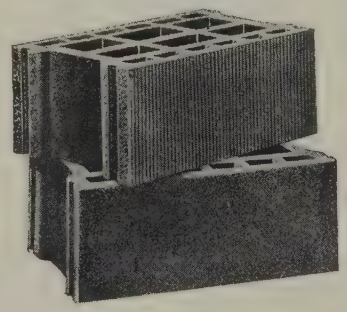
Adaptability

Natco Double Shell Face Tile is extensively and successfully used for residences, churches, schools, garages, factories, warehouses, gas stations, etc. It is the logical choice for any structure where attractiveness, permanence and comfort must be combined with economy.



Natco Tex-Tile

Furnished with outside face either unglazed or glazed with the inside face scored for plaster



Natco Combed Face Tile

Furnished with outside face glazed and the inside face smooth glazed for exposed interior finish

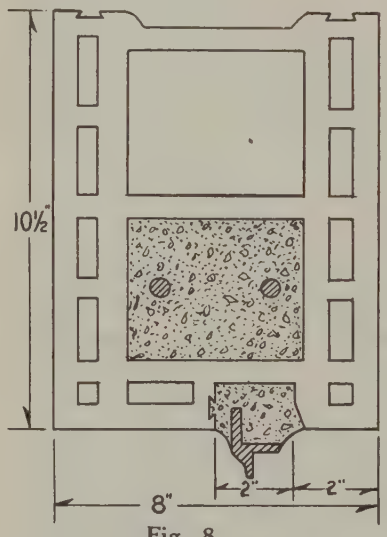

Fig. 8

Detail of lintel showing reinforced concrete beam in cell of tile and also method of bedding steel sash frame in the recess in steel sash lintel tile.

A method of reinforcing lintels over wide openings or where a heavy load bears above the openings. In order to allow the flanges of angles to go inside the tile, it is necessary to break out the small web of tile. This is very easily and safely done by tapping the web lightly with a hammer, breaking it out in small pieces until the web has been tapped out about half the length of the tile—then start at other end of tile and work to the middle

SUGGESTIONS FOR PILASTER CONSTRUCTION

The walls of industrial and commercial buildings are often designed to be built to considerable height without cross walls, and to bear heavy concentrated loads, such as floor beams and roof trusses. In these cases it is customary to build pilasters to stiffen the wall for wind pressure, and to carry these concentrated loads. Below are shown several pilaster layouts, and our engineering department will gladly furnish others if needed. Note that all pilasters are thoroughly bonded in the wall.

Natco Partition Tile

In addition to their fire-resisting qualities, hollow tile partitions are light, strong, easily erected by bricklayers, and do not transmit heat, cold or sound.

All partitions and furring tile, unless otherwise specified, are scored to receive plastering. If the surface is to be whitewashed the tile can be made smooth.

Wood or channel-iron bucks are placed in all door openings, and should be 1½″ wider than thickness of the tile and act as grounds for the plastering.

It is not generally practicable to use 2″ tile for partitions, except for closets, shafts, etc.

Partitions of 3″ can be safely used up to 12′ in height, 4″ to 16′ and 6″ to 20′.

The tile are commonly made 12″ wide by 12″ long, except 2″ tile at eastern and northeastern factories, which is made 12″ long but 8″ wide at eastern factories and 6″ wide at the northeastern factory. They can be made any size required, but special sizes are necessarily more expensive.

In office buildings it is good practice to have all the main corridor and stairway and elevator enclosures of 4″ and the partitions between rooms 3″. Partitions should be bonded where meeting and anchored to wood bucks or brick walls by using tenpenny nails, or metal wall ties, in each second joint.

Tile should be set on end, except top course, which may be set on side. When required for outside walls exposed to the weather the tile must be specially made of dense material, hard burned. At a slightly increased cost they can be made smooth on outside face and do not require plastering. They should be not less than 6″ thick.

Natco Split Furring Tile

Brick walls exposed to the weather must be furred with hard burned tile, to prevent dampness reaching the interior and destroying the plastering and interior decorations.

The tile are made either 1½″ or 2″ thick and 12″ square. The ribs being set against the wall, an air space is formed which effectively checks the passage of moisture. They should be set with the ribs vertical without mortar at back and fastened to the wall by driving .10d nails in the joints of the brickwork, the head of the nail being bent down upon the tile, using a nail over every third tile in every second course or metal wall ties may be embedded in wall, as provided by local building codes.

Where walls must be straightened or furred out to line with the face of piers the 2″ tile cannot be used. If the ceiling height is not too great use 3″ partition tile. If the space is greater than 3″ the tile may be set out from the wall leaving a clear air space behind them. They should be braced at intervals by the use of drive anchors or 4″ tile can be used without the anchors. This is known as free standing furring. The face of the tile is grooved for plastering.

NATCOFLOR

Description

Natcoflor System is a combination of special shaped Natco tile with 2″ wide cement grout joists or ribs spaced 13″ center to center between the tile. Each rib is reinforced with two steel bars, one straight and one bent.

No concrete is required on top of the tile for structural purposes. Wooden sleepers are placed directly on the tile, and are held in place with cinder fill or sleeper clips.

The design of the tile is such as to place the maximum sectional area of the tile unit where it will be of the most use in resisting the compressive stresses. The dead weight of the tile thus has been kept down to the minimum. In other forms of "Combination" systems, these stresses are taken care of by the concrete top. The tile are made from special clay which gives them high compression strength. Tests have repeatedly and clearly demonstrated that tile may be safely figured to take compressive stresses of 1000 pounds per sq. in. of net sectional area, allowing an ample factor of safety.

Cement grout or mortar mixed one part cement to two and one-half parts sand is used for the 2″ joists. This thoroughly covers the steel reinforcing and completely fills the joints between the tile. (At girders, etc. where the open ends of the tile are exposed, the tile are first placed on end and the cells stopped with about 1″ of mortar.) The flanges of the tile meet at the bottom to form an all tile ceiling thus assuring an excellent base for plastering.

With Natcoflor, greater speed of erection at a much lower cost is secured. This is due to the perfect alignment of the tile, small amount of material required for reinforcing joists and the extremely light dead load as compared with other strictly fireproof floors.

Our engineers will be glad to give architects and designers any assistance required in using this construction.

Special Features

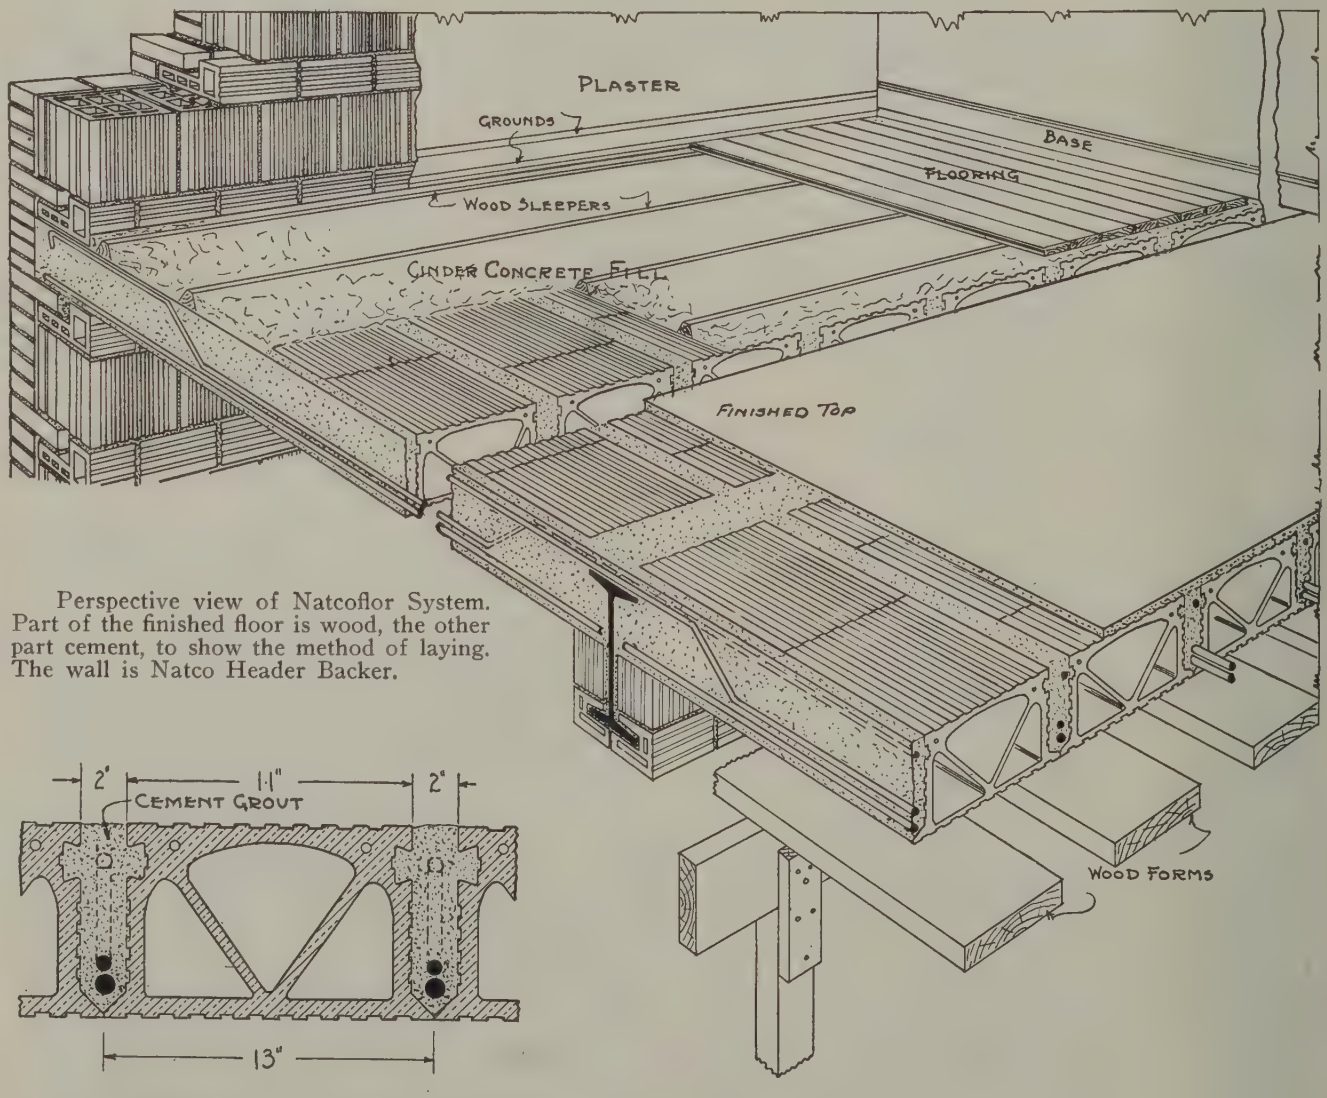
Saves Dead Load—In either steel or concrete frame and foundation.

Saves Floor Depth—2″ to 4″ less than other construction.

Saves Plastering—No metal lath or suspended ceiling. A continuous tile surface.

Saves Labor Cost—Permits speedy erection the year around.

Saves Insurance—Strictly fireproof construction.



Perspective view of Natcoflor System. Part of the finished floor is wood, the other part cement, to show the method of laying. The wall is Natco Header Backer.

Notice in the detail view, how the tile meet at the bottom, to form an all-tile ceiling.

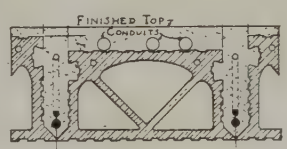
Design Data

Size, in.	4	5	6	7	8	9	10	11	12
Mortar per sq. ft....cu. ft.	.051	.064	.077	.090	.102	.115	.128	.141	.154
Wt. of tile .....lb.	26	28	30	32	34	37	40	44	47
Wt. of floor...lb. per sq. ft	30	34	39	42	45	48	52	56	59

Note: Unit shear not to exceed 60 lb. per sq. in. Width of joist may be figured 3½" in computing shear (2" for joist and ¾" for each adjoining shell of tile).

Conduits

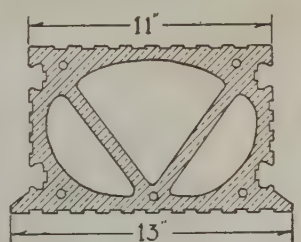
When cement or terrazzo floors are used, a run for conduit may be easily made by putting in a series of tile less in depth than the rest of the floor. In the case of wood floors, the conduit may be run between the sleepers.



Negative Moment and Shear Tile

Our company is able to furnish a special Natcoflor tile for use adjacent to the supporting members to take care of any excessive negative moment or shear at these points. This tile is so designed that the compressive area at lower portion of the tile is the same as the area in the upper portion besides having the additional key for the grout at the bottom. Generally two or three pieces of this special tile are required adjacent to the supporting member, depending on the designer's requirements. In some cases they would not be needed.

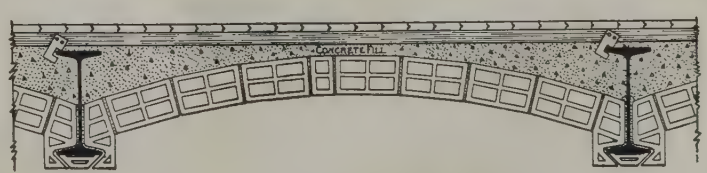
The advantages of this tile are that in some cases a saving in depth and cost of floor may be obtained. For example, a floor must sometimes be increased in depth because of excessive shear or negative moment although it meets the other design requirements. The tile weighs little more than the ordinary Natcoflor and the dead weight of the floor as a whole is not affected.



Negative Moment and Shear Tile

NATCOFLOR SYSTEM OF FIREPROOF FLOORS

This form of arch combines great strength with economy and lightness. It is particularly adaptable to warehouses, lofts, factories, sidewalks, or wherever a flat ceiling is not necessary.



The 6" arch is most commonly used and weighs approximately 35 lb. per sq. ft.

End construction tile may be used, but they are unsatisfactory unless the arches are of uniform span and rise throughout. Where a very light, strong arch is required in deep beams, and a flat ceiling is also demanded, use a suspended ceiling below the beam.

The most effective location for the tie rods to counteract the thrust is near the bottom of the beams. They may be placed there and painted, or set higher and protected by the arch. If this is done the rods in the end spans should be made forked or double rods set crossing each other.

Complete engineering data on application.

NATCO SEGMENTAL ARCH FLOOR

Continued on next page

NATCO FLAT ARCH FLOORS

General

Flat arches as adapted to floors and roofs are made up of various shaped tile as shown on Natco Page 28. The tile resting against the beams are called "skews" and the protection for the beam known as the "soffit" tile is held in place by the bevel on the "skews." The intermediate tile are called "inters" and the center one the "key."

Natco Flat Arch in general comes under two divisions, namely, the "End Construction Flat Arch" and the "Side Construction Flat Arch" each described and illustrated below.

The depth of the arch must be proportioned to the span between the beams and to a certain extent to the load carried. A safe general rule for finding the depth of the arch in inches is to multiply the span in feet by 1½" and add the thickness of the protection below the beams. This is the code requirement of the larger cities in general.

The outstanding advantage of the flat arch is its adaptability to speed in construction independent of temperature. Centers need remain in place but one-tenth to one-fourth as long as required under concrete construction. Moisture due to cement hydration is minimized.

Flat arch is most economical. Although the arch itself is placed by bricklayers, this labor cost is more than offset by the low centering cost. Centering is hung. (See Natco Page 27.) There is little or no lumber loss—no nails are used. Floors beneath are accessible for work by other trades.

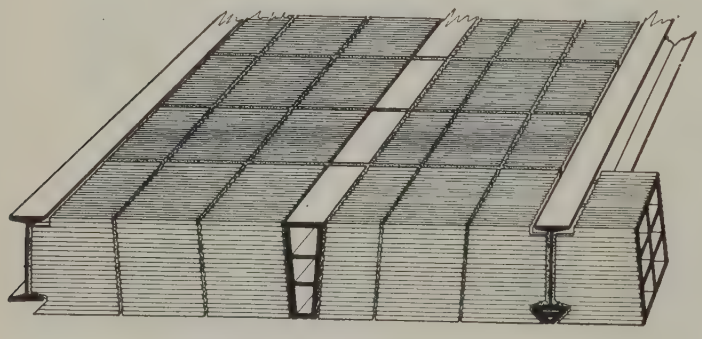
By the omission of tile units at the time of erection, pipe work of the mechanical trades is economically accommodated. Holes may be cut at any time, almost with impunity, and later easily patched.

The all-tile ceiling provides the most satisfactory surface for plastering.

Natco End Construction Flat Arch

Natco End Construction Flat Arch consists of end construction skews and inters and side construction keys.

This arch is the most adaptable form of arch, since the end construction skew can be cut to fit different elevations and sizes of the beams. Of course, it is advisable to keep the bearing beams as near the same elevation as possible so that the same skew which is usually cut to allow a 1½" or 2" soffit of tile under the beams may be used throughout and make for uniformity and, therefore, economy of construction. Moreover, this gives a more uniform ceiling level.



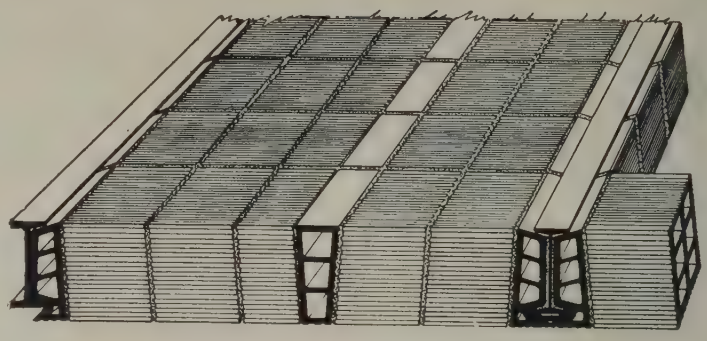
Typical End Construction Arch

Natco Side Construction Flat Arch

Natco Side Construction Flat Arch consists of side construction skews and keys and end construction inters.

By reversing the direction of the cells in the skews, better protection is given to the sides of the beams by the mortar joints and by the shells of the skews. The inters must be set end to end in straight courses from skew to key. The typical section illustrates the method of assembling the various members of this arch.

Side construction skews, being made by die to fit the various size standard beams, cannot be changed, as can end construction skews. If it is desired to use side construction skews uniformly throughout a building, the bearing beams must be on the same level at the bottom and of sufficient depth to permit the top of the skew to go under the top flange of the beam. Of course, special conditions can be taken care of by using end construction skews at these points and cutting them to fit.



Typical Side Construction Arch

Designing Data

The following table is applicable to all shapes of tile. Generally speaking, hollow tile of various shapes but of the same depth and cross-sectional area, have equal strength, and therefore, the strengths of arches of equal depth are directly proportional to their net sectional areas. The depth of arch as given in the table includes the protection underneath the bottom of the beam or the thickness of the soffit tile.

The strength of any arch depends as largely upon the workmanship as upon the material. The spans given in the table are safe if the arches are properly set, but may not agree with the requirements of the Building Codes of various cities.

Safe Loads given in the table have been figured for the Natco Combination Arch of side construction skews and keys with end construction inters. The net sectional areas of tile indicated, are for the keys—the critical point of the arch—and are taken per foot of tile parallel to beams.

Weights of arches have *not* been deducted from safe loads in the table; this and other dead load must be deducted to obtain the net safe live load for any arch and span.

Engineering Service

It is part of National Fire Proofing Company's service to design the arches for each individual span and furnish schedules and sketches showing the pieces which should be used in each size of span, and to make skews which will fit the structural steel work.

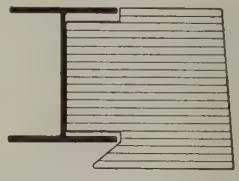
Keys

(Furnished in 3″, 4″, 5″ and 6″ thicknesses measured at the center line of arch)



End construction skew cut at top and bottom for wide flange beam

NATCO FLAT ARCH FLOORS

NATCO BOOK TILE

On account of their shape these tile are called "Book Tile," and they are made especially for roofs to be covered with concrete, tar and felt or any composition roofing. They are made of uniformly hard-burned material 3″ thick, and of a length depending very much upon the weight to be carried.

The steel framework T's should be spaced 1″ wider on centers than the length of the tile.

Book tile are used for covering the flat roofs of penthouses, bulkheads, etc., and may be used for main flat roof of a building when only light live loads are anticipated.

When providing for future increase in height of a building, a floor of flat arches is set and roof grading placed on temporary supports of T's (or dwarf-walls), and book tile.

Natco Book Tile permits a minimum of condensation of moisture underneath due to its high insulating qualities. This makes it invaluable for the protection of manufacturing processes, such as glass making, etc., where the product might be injured by the drip of water.

NATCO COMBINATION LONG SPAN FLOORS

Natco One Way System

The Natco Combination One Way System is particularly adapted to all classes of buildings where long span fireproof floors are required without the beams showing in the ceilings. The Natco Hollow Tile in combination with the load bearing concrete reduces the dead load and provides a good plastering surface. The tile make permanent forms in which are cast the series of connected concrete "T's."

The tile in a line of units are all in contact, and hold each other securely in the proper positions. They are not displaced in pouring the concrete, and no realignment is necessary.

The naturally strong adhesive bond between tile and concrete, aided by the mechanical bond of the dovetail scorings on the tile, produce a monolithic effect.

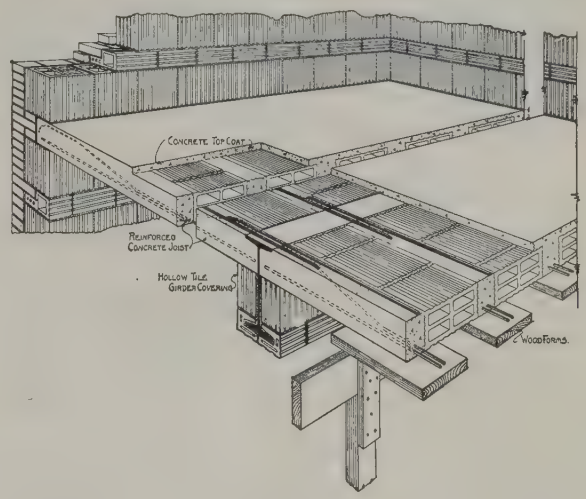
In these floors, the Natco Hollow Tile fireproofs the load carrying concrete of the beams against the flames of a fire below. Without this protection, a fire is likely to cause spalling, rapid weakening of the floor, and ultimate failure.

Special Two Way System Tile

Besides our regular one way system of combination floor we are able to furnish a special tile adaptable for a two way system of combination floor.

This special Natco tile is a hollow tile block *with no exterior openings,* which prevents the concrete from entering the cells as would be the case if ordinary floor tile were used.

The design of the two way system is similar to the one way, the joists running in two directions at right angles instead of one which distributes the load in two directions. This floor has the advantages of decreasing the depth of slab, eliminating deep spandrel beams, and giving a very rigid floor laterally. No additional cross-bracing is required, which is a very important consideration in tall buildings subjected to high wind stresses.



Perspective View of Typical One Way Combination Floor

Note economical wood centering used; 2x8″ or 2x10″ under each joist is sufficient

Tile Depth and Steel Area Required, One Way Combination Floor Slabs, 2″ Concrete Top, Joists 4″ wide, 16″ O.C.

fc.=650 lb. per sq. in.

NATCO COMBINATION LONG SPAN FLOORS

Continued on next page

NATCO GIRDER AND COLUMN COVERING

The purpose of beam, girder and column covering is to place a retardent to fire over the structural steel frame of buildings, and to provide a surface on which to plaster. This goes under the general name of "Fireproofing of Steel."

Natco Fireproofing Is Reliable

It is necessary that the steel columns and the girders and beams projecting below the floor slab, be protected by at least 2" of fireproofing material. Experience has proven that well-burned hollow tile (burned at temperature of about 2000° F.) has no equal as a covering for structural steel or iron. In case of a serious fire, the integrity of the whole structure depends upon the thorough protection of the columns and girders and floor beams, and no reasonable expense should be spared to accomplish this.

Natco Fireproofing Satisfies All Conditions

There is a shape of Natco Girder Covering to fit in with almost any condition of fireproofing which may be required. The lower flanges of rolled beams and girders of any size have a Natco Clip or Shoe Tile to fit them. Plate girders, double beams and riveted sections are protected by means of a hung soffit and angle tile (see Figs. 4 and 8). The sides of the beams are protected by proper thickness filler tile at heights designed to fit neatly the opening between top of clip or angle tile and floor slab or top flange of beam. (See illustrations.)

If heavy plaster cornices are used, the girders are protected first by the hollow tile, and the shape required for the plastering is obtained by iron brackets and metal lath. This latter, alone, is not sufficient protection.

Natco Fireproofing Saves Dead Load

Tile covering saves from 50 to 75% in weight over concrete or brick covering. Even on a small 12" I-beam the saving is 50% in weight; in the large girders it is much greater. (See Fig. 9.)

Natco Fireproofing Saves in Cost

Tile fireproofing can, in general, be put in place complete for close to the same price as it costs to erect box forms about the beams for the concrete. In addition, you have the cost of steel beam wrapper and of the concrete itself to add to form cost; therefore, a saving of approximately 25 to 50% in cost, over concrete covering, can be made by use of tile.

Natco Fireproofing Promotes Speed of Erection

No forms being needed to hold the tile in place, there is, of course, no period of waiting for concrete to set before shores and forms can be removed.

Natco Fireproofing Provides Best Plastering Surface

One of the greatest advantages of tile beam and girder and column covering is the excellent plastering surface which is given to receive this finish.

No other surface is more economical of plaster, nor has a better mechanical key or more capillary suction than has tile. The absorption of moisture is small and test shows that the tile and plaster become almost one body. Only two coats of plaster are needed on tile.

Where steel columns are to be stiffened with concrete or where concrete columns are to be finished with plaster, the forms for same may be built out of partition tile or column covering. The tile must be banded with steel wire or strap iron, and mortar must be allowed to set, however, before the concrete is poured so that there will be sufficient strength in the wall to take care of the side pressure of the wet concrete.

Natco Fireproofing Will Carry The Load Safely

Tile girder covering has always been used with flat arch construction of floors, but present day contractors are finding a great saving in its use with all forms of concrete and long span type of floors. Where the span is long and where there is a considerable load on the floor joists, it is customary to use tile filler with the cells vertical, so that concrete can run into them and give a continuous solid bearing of the concrete joints on the lower flange of the beam. (See Figs. 6 and 7.) Even horizontal fillers are amply strong enough to carry the total load of the ordinary floor safely and well within the allowance for tile walls under building codes.

Natco Fireproofing Lowers Insurance Rates

Due to the tendency of the time to lighten up in the construction of floors in order to effect saving in steel, there has come into recent use a great variety of floors of thin built-up sheet metal joists, of built-up joists of bars, and light weight structural beams with a thin slab of top concrete. These floors depend for fireproofing merely on a ceiling of plaster on metal lath.

It is self-evident that if the supporting steel beams are not protected by something other than these ceilings, fire breaking through a portion of the ceiling will get to the structural beams and the entire floor or structure will fall. Such supporting beams should be fireproofed entirely up to the underside of the concrete floor slab on top of the joists, in which case the floor slab might fail, but the structure will be intact. (See Fig. 10.)

Buildings constructed of heavy slow burning timbers and floors on a steel frame can be made much more secure and obtain a much better insurance rate if the beams and columns be encased in tile.

Natco Fireproofing a Barrier Against Corrosion

No better protection can be found for structural steel against corrosion than tile masonry with good cement mortar filling space between tile and steel. Exterior steel members should, therefore, be built in solidly with tile masonry.

Natco Fireproofing Service

The standard shapes entering into the construction of Natco Beam and Girder Covering are carried in stock at all times. Regardless of the size of the job, shipments can be started promptly and kept up as needed, provided, of course, that proper notice is given of the extent and nature of the requirements so that the factories can be scheduled to take care of them.

It is not necessary for the architect or contractor, when designing for or estimating on the use of Natco Hollow Tile Beam and Girder Covering, to worry about the sizes and shapes of the tile clips and filler which must be used on the various size beams.

It is part of the service provided by the National Fire Proofing Company to furnish with each order for this material, a set of schedules for the architect's approval and the contractor's use, designating just what will be furnished for each beam shown on the final steel erection plans. This material is all sold on a basis of the square footage of the actual outside surface of the tile surrounding the beam from bottom of floor on one side of beam to the bottom of floor on the other side.

Estimates can be made of the approximate amount of this tile by taking the linear distance in feet around (A + B + C) as shown in Fig. 1 or (A + B + C + D) as shown in Fig. 2, and multiplying this sum by the length of the beam in feet.

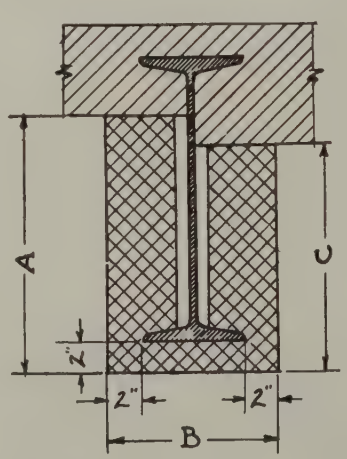

Fig. 1

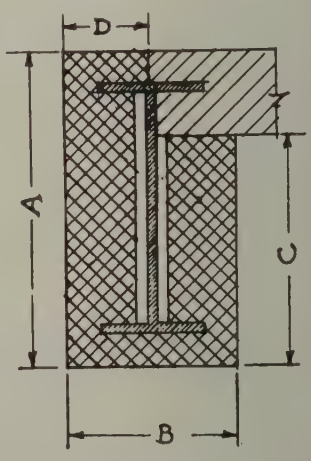

Fig. 2

After order is placed, a full set of the architectural drawings and a set of the final structural steel erection plans, as made up by the structural steel fabricator, should be forwarded to the National Fire Proofing Company as soon as possible, so that design can be made and submitted for approval at earliest date possible.

L43	.65	13	2	6	5	2	.....	4	3
L46	.95	19	2	6	8½	2	.....	4	6½

How to Select and Order Proper Clip Tile for Beams

(1) Obtain the width of the beam flange, either by field measurement, or from manufacturer's handbook.

(2) Select in the above table the clip tile, having the "F" dimensions nearest to ½ the width of the flange.

(3) Order two pieces of clip tile for each linear foot of beams when the flange is covered on both sides.

Example—Beam having a flange width of 6¼″ will require a G-30, since ½ of 6¼″ is 3⅛″; and G-30 has "F" dimensions equal to 3″.

For some of the especially thick flanged beams, it is well to check the "G" dimension of the tile with the thickness of the nose of the flange of the beam.

Angle tile should be selected so that the "G" and "F" legs are long enough to cover the special condition for which it is needed.

Handling at the Job

In handling at the job, it is well to instruct your labor foreman that when a G-20 Clip is called for, the "F" or jaw dimension is two inches, a G-25 is 2½″, etc. on down the list. Similarly an L-23 is 2″ at the "F" and 3″ at the "G" dimension, etc. for all of the angles, except that the "G" dimension for the L-26 and L-46 angles is 6½″.

Caution: When material is received at the job, it is essential that all sizes of Clip, Angle and Filler Tile be piled in separate groups. If this be done, the handling of the shapes from pile to bricklayer will be greatly expedited.

Special Thickness of Fireproofing to Fulfill Ordinance Requirements

Where ordinances depart from the generally accepted standards nationally established, the National Fire Proofing Company in all cases provides Girder and Column covering of thickness and design that fulfill the ordinance requirements in that particular locality or district. In such cases special details, comparable to those illustrated under this heading, have been prepared and are accessible at the branch office serving the locality.

Our representatives are thoroughly familiar with all local building ordinance requirements pertaining to fire proofing within their respective territories—their advice and suggestions are always promptly available.

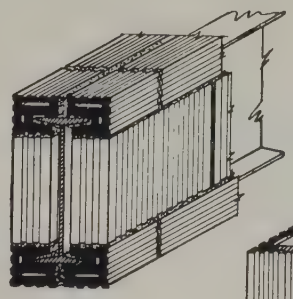

Fig. 3
Shows method of entirely enclosing a strut or beam which is in no way protected by the floor or other masonry

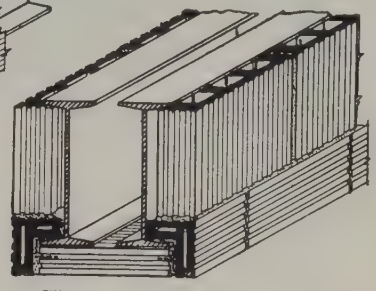

Fig. 4
Double beams, if not too far apart, may be protected on the bottom by long shoe or clip tile, however, if it be over 14″ from the outside of flange on one beam to the outside of flange on the other beam, a 3″ soffit tile is hung on metal hangers, which the contractor may make of No. 16 gauge or heavier strap iron. An angle tile is mortared over the end of this and after the mortar has set, the hanger serves as a reinforcement for the corner

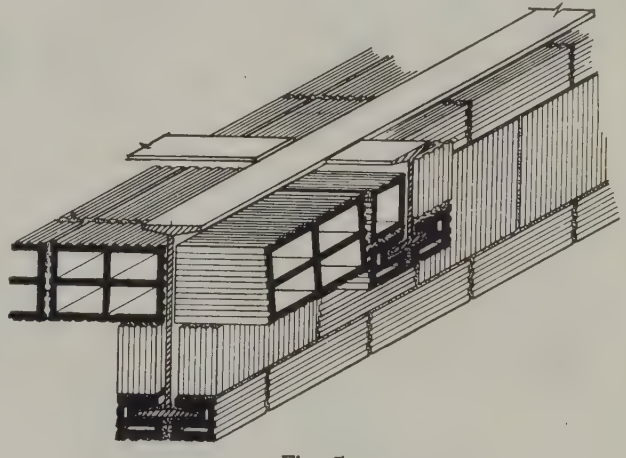

Fig. 5
Illustrates conditions of covering in flat arch work. Note especially covering where the arch is parallel to shoe on small beams and the full side covering at opening in floor

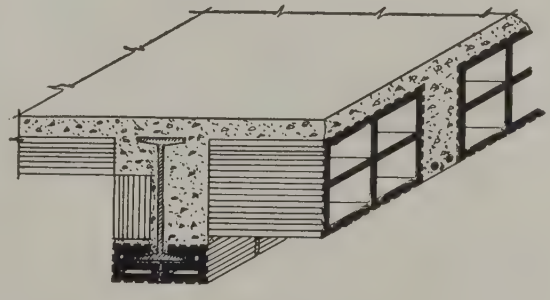

Fig. 6
Shows method of using tile fireproofing with long span concrete joist floor construction. It is economical either with structural tile or metal pan filler in the floor. You will note that the covering is put in place before the floor is poured and that the concrete of the joist fills the cells of the tile and bears directly on the flange of the beam

NATCO GIRDER AND COLUMN COVERING

Continued on next page

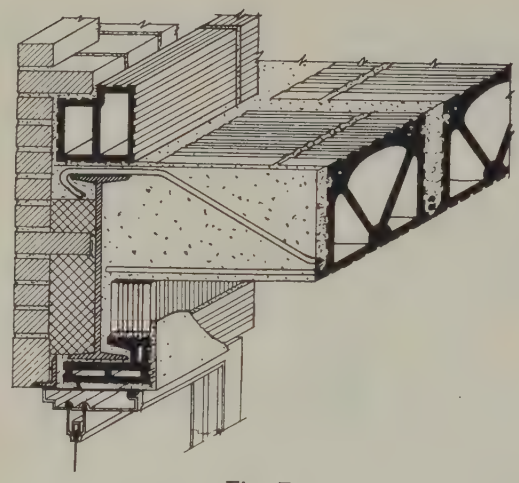

Fig. 7

At spandrel beams over window heads and in similar places, a long clip tile can be furnished to give a good return for plastering and at the same time thoroughly fireproof the underside of the beam. Note illustration of the "Natcoflor" system and of Natco Unibacker wall construction

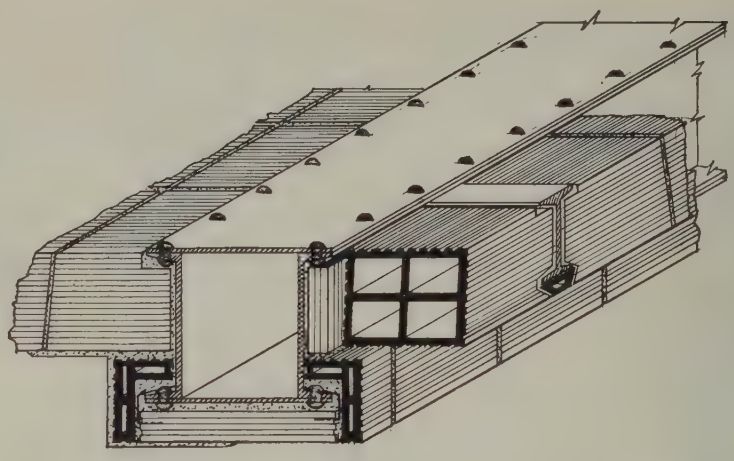

Fig. 8

Box Girders or any riveted sections are protected on soffit by hanging proper length of 3″ book tile on bottom by means of steel hangers (furnished by the contractor) and covering the ends of these with long lip angle tile. This fireproofing is done before the arches are set

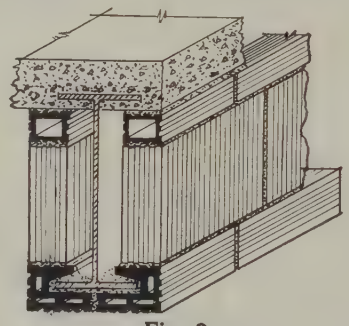

Fig. 9

Fireproofing with concrete slab floor construction. Note the extreme saving in dead load on these large girder beams due to the hollow construction. These beams are often covered after the floor is in place, thus permitting the use of the bottom flange to support floor forms

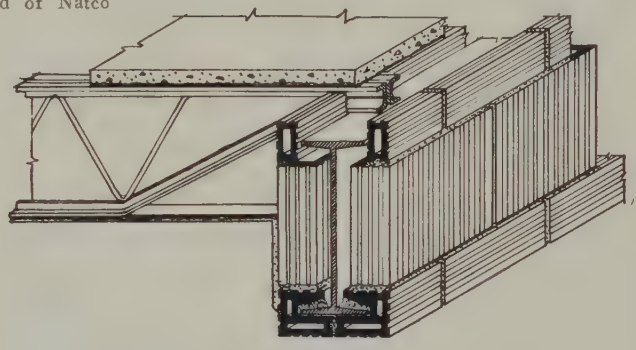

Fig. 10

The various types of light weight floors constructed of a thin slab of concrete on top of some form of light metal joist, which is protected only on under side by an ordinary coat of plaster on metal lath, are only rated as a semi-fireproof construction. We here show method of protecting the structural steel members used in connection with such construction by covering the tile entirely up to the under side of the concrete slab

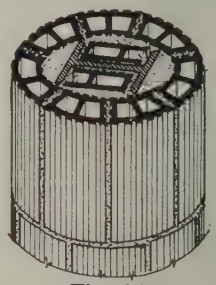

Fig. 11

Like the Bullnose Column Covering, not much of the 3″ Circular Covering is carried in stock, but any normally sized order can be manufactured in a reasonable time. The radius of the tile is 10″ on the outside and it is suitable for columns 16″ to 28″ in greatest dimension. This material is sold at a price based on the square foot of exterior surface.

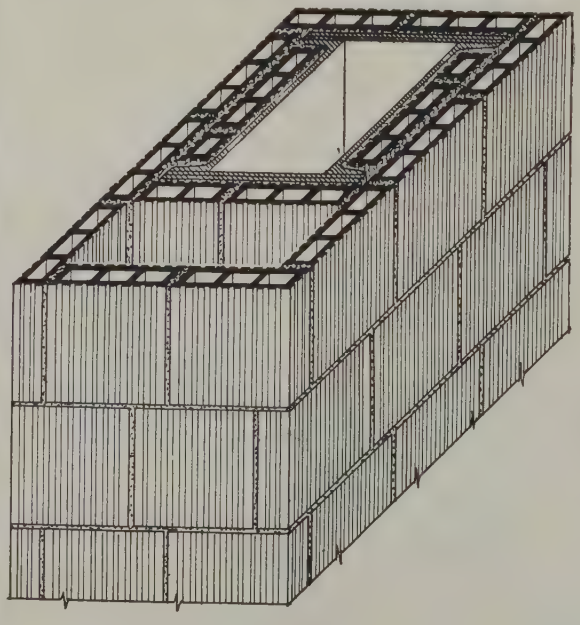

Fig. 12

Shows method of providing pipe space and vent ducts by building same in conjunction with the protection of the steel columns

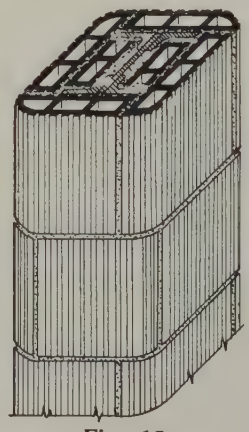

Fig. 13

Shows use of 3″ Natco Bullnose Tile in encasement of columns. No great quantity of this tile is carried in stock, but same can be manufactured on short notice, where requirements justify same

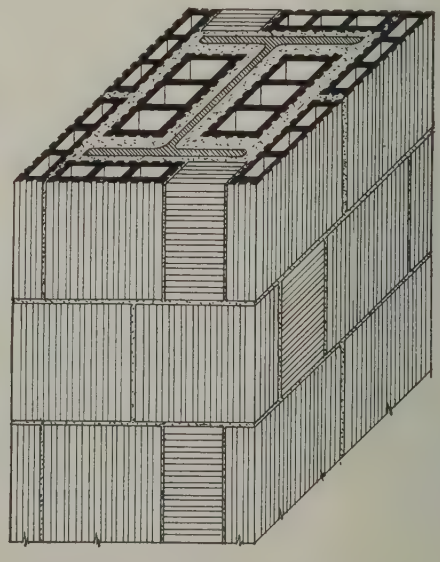

Fig. 14

Structural steel columns are most economically protected by encasing them with at least 3″ of hollow tile

NATCO GIRDER AND COLUMN COVERING

RARITAN HOLLOW TILE CORPORATION

47 West 34th Street, NEW YORK, N. Y.

FACTORY: KEASBEY, N. J.

Products

HOLLOW TILE BLOCKS for partitions, furring, column and girder covering, etc.; LOAD BEARING EXTERIOR WALL BLOCKS and RARITILE ENCLOSURE BLOCKS for use with face brick.

Facilities

The location of the company plant on the Raritan River two miles west of Perth Amboy and a direct connection with the Lehigh Valley R. R. places the RARITAN HOLLOW TILE CORPORATION in a position to make prompt shipment either by rail or water. And as all shipments are made direct from the factory, the company is solely responsible for materials and deliveries.

The clays are mined on the company property adjoining the factory, which is equipped throughout with modern machinery.

Raritile Enclosure Blocks

In the past few years, there has been a remarkable increase in the use of hollow tile blocks in conjunction with either common or face brick for building curtain walls for skeleton steel structures. This type of construction not only shows a marked saving in labor costs, but it also decreases the weight of the walls so constructed by about 30%, and thereby effects a proportional saving in the amount of steel required for wall columns and spandrel beams.

The Raritile Enclosure Tile protected by W. G. Demarest patents No. 1,426,048 and 1,479,379, has the good features common to systems in which hollow tile is tied in to face brick and has also the following additional advantages.

(1) A continuous vertical air cell on the interior of the wall running from floor to floor eliminates the necessity of additional separate furring blocks.

(2) The mortar joints are broken—there are no continuous joints through the wall.

(3) The blocks are of uniform height and approximately of uniform weight. This feature helps to speed up construction and makes it easy to tie in the face brick with any type of bond.

(4) The wall is so designed that webs and shells of the various blocks are in perfect alignment. In this way all material acts in compression and the full bearing strength of the tile is utilized.

Column Covering

For use with the Raritile standard wall block a 4-in. block of the same height is furnished for covering wall columns. This construction is simple and economical; the cost is approximately 30% less than a brick wall of the same thickness.

UNIVERSAL UNIT TILE COMPANY

EXECUTIVE OFFICES

Scripps Building, SAN DIEGO, CAL.

LICENSED MANUFACTURERS

COLUMBUS, OHIO, Claycraft Mining & Brick Co.
DALLAS, TEX., Reliance Brick Co.
KANSAS CITY, MO., United Clay Products Corp.
LOS ANGELES, CAL., Rogers Building Materials Co.
MACON, GA., Cherokee Brick Co.
MINERAL WELLS, TEX., Mineral Wells Brick Co.
PUEBLO, COLO., Summit Pressed Brick & Tile Co.
ST. LOUIS, MO., Alton Brick Co.
SAN DIEGO, CAL., Atlas Brick & Clay Co.
SAN FRANCISCO, CAL., Port Costa Brick Co.

Product

Hollow Building Tile for structural purposes of novel and improved design, suitable for all types and varieties of buildings in which burned clay products can be used.

Design

The Universal Unit was designed to overcome the disadvantages of the present commercial forms of structural hollow tile and to facilitate and reduce the cost of manufacturing, shipping, handling, estimating and laying.

TRADE-MARK

Advantages of Universal Unit Tile

(1) One size and shape for all standard thicknesses of walls and details of construction. Starter, corner, jamb, sill, filler and all special shapes readily cut with trowel from standard unit leaving sections of usable size.

(2) Units are two bricks wide, three high and one long, with mortar joints, thus displacing six bricks in wall. Building construction can be designed with the Universal Unit same as for brick as they cut into any necessary combination of brick sizes.

(3) This construction offers maximum resistance to frost and dampness penetration. All mortar bed joints are offset, lead upward from exterior to interior face of wall and are interrupted by vertical rising voids. Stucco and plaster may be applied direct to tile without furring.

(4) Latticed interior construction and direct line continuation of webs through entire Unit insures maximum load bearing and lateral strength.

(5) No ties or reinforcing required except for arch and lintel construction; jamb tile make masonry bond with wall.

(6) Brick veneer work can be figured in supporting strength of walls as Unit bonds perfectly with it.

(7) Perfect balance, easy and quick to lay.

(8) Units nest perfectly, hence minimum breakage.

(9) Units simply yet positively interlock.

(10) Size, shape and cut-up features simplify quantity calculations.

(11) Facilitates placing grounds and plugs for interior finish without danger of moisture penetration.

Estimating and Construction Data

Face sizes of units 8x8x8 in. Two units lay exactly one face foot of 8-in. wall; three units for 13-in. walls; four units for 17-in. walls, etc. Units weigh between 17 and 18 lb. Lintels formed of standard units or cut sections reinforced and filled with concrete, as required.

Tests by recognized testing engineers show each unit to have crushing strength of 50,000 to 100,000 lb.

Use of Brick

As units are worked out to brick sizes in every dimension, walls can be built entirely without brick or brick can be used anywhere in construction and they line and bond with the tile.

Quality and Marking

All load-bearing Universal Units are composed of properly prepared grades of hard burning clay, shale, fire clay or mixtures thereof to provide maximum strength and fire resistance. Each unit has trademark "UU" impressed thereon.

Non-bearing Construction

Universal Unit tile offers superior advantages for curtain and filler walls in pier and girder construction. The convenient size and shape, ease and rapidity of handling and laying, make it compare favorably in cost with plain tile. Its lightness, in addition to its fireproof, frostproof and dampproof feature, renders its use most desirable in construction of this class.

In cities and localities where the Universal Unit is now available, it is rapidly being given preference over other forms of hollow filler wall construction.

Farm Buildings

The advantages of fireproof construction on the farm is rapidly being realized. Universal Unit is a superior material for all types of farm buildings, houses, barns, silos, corn cribs, etc. The one size and shape builds all.

The simplicity and economy of this construction especially recommend it for use where skilled labor is difficult to obtain and construction costs must be minimized.

Availability

Universal Unit tile is available for immediate shipment in many sections of the South, Middle West and Pacific Coast, and additional territory will soon be covered. The nearest sales office or agency can be obtained from the Executive Offices, Scripps Building, San Diego, Cal.

Patents

Universal Unit tile is manufactured and sold under the Richard S. Requa patent issued May 25th, 1920. Other United States patents allowed and pending. Patents pending, or issued, in all principal foreign countries.

Engineering Service

Free engineering service for advice or data concerning construction problems in connection with the use of Universal Unit tile is available at the Executive Offices. Architects, engineers and contractors are invited to freely avail themselves of this service.

Catalogues and Construction Details

Catalogues, detail sheets, miniature samples and general construction data will be supplied from the Executive office or any of the branch offices.

Specifications for "Universal Unit" Structural Hollow Tile Work

Work Included—Exterior walls and wherever called for on drawings, to be built of hollow tile as hereinafter specified.

Quality and Make—All hollow tile to be in the interlocking and load-bearing type supplied under the trade-name of "Universal Unit." The tile shall meet the load-bearing and other requirements of the local Building Code.

Mortar—All mortar for tile work shall be composed of 1 part portland cement to not more than 3 parts clean sharp sand, to which may be added lime paste or hydrated lime not exceeding 15% of the volume of the cement.

Construction—Tile shall be laid in the wall with the voids running horizontally, with the lower projection on the exterior side of the wall, as per manufacturer's drawings. All horizontal joints shall be flushed solid, but the vertical section of the offset bedding joints shall be left free of mortar to prevent dampness being drawn through the wall. Tile shall be laid so that the wall throughout shall be thoroughly bonded with masonry bond. Corners to be formed with half-tile laid on end and filled with mortar where required for the additional strength.

Openings—All openings to be formed with the tile, cut to special shape as required. Jamb tile to be laid on end and all voids adjoining the exterior side of the wall shall be filled with mortar. Jamb tile shall be locked and bonded with the wall courses. There shall be no solid mortar joints extending through the wall.

Lintils—Lintils over openings may be formed of the tile with voids filled with concrete and reinforced as required for adequate strength, or they may be of reinforced concrete cast in place.

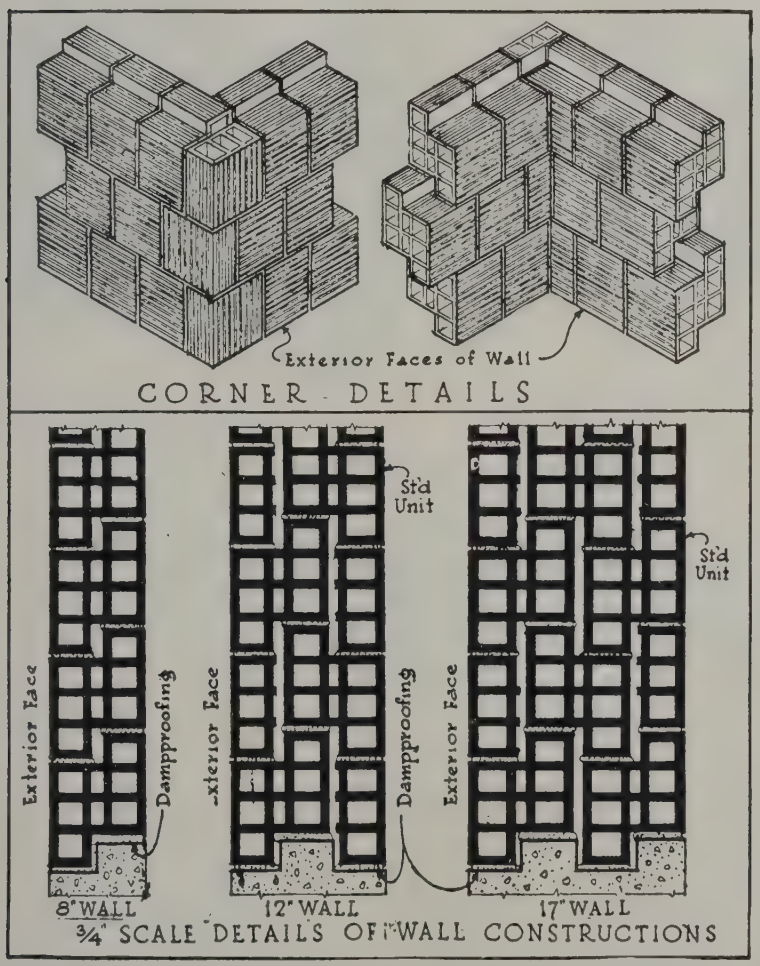
Anchoring Woodwork—The carpenter will place and accurately set all wood frames required in the openings in the tile walls, as the walls are built. Anchor these frames to the tile work each course with 10d nails driven partially into the frame and bent down over the tile. Bed ½-in. bolts supplied by and as directed by the Carpenter, every third course for securing end studs of frame partitions.

Joist Bearing, etc.—All joists, beams, etc., seated upon hollow tile walls shall extend into the wall so as to have full bearing on two supporting webs. Where heavy concentrated loads occur, the supporting section of the tile receiving the load shall be filled with concrete, and, if necessary properly to distribute the load, bearing plates of proper size or cast concrete shall be built in.

Stuccoed Work—Where walls are to be stuccoed on the exterior and plastered on the interior, the tile may be laid with no mortar in the vertical joints, the joints to be left open to provide an additional key for the plastering.

Chases for Pipes, etc.—Provide chases for pipes, conduits, etc., as directed. In no case shall the tile be cut through the second web so as to destroy the waterproof feature of the tile unless the spaces around the pipe are filled solidly with cement mortar.

Flashings—All flashings shall be built into the walls to the depth of the rebate. In building parapet walls, the tile work shall be brought up not less than 4 in. or more than 8 in. above the roof level and the work stopped at that point until the roofing has been laid and flashed into the rebate of the course, when the walls shall be completed to their required height.



Detail Drawings, Showing Simplicity of Construction, Waterproof, Fireproof, Interlocking and Load-bearing Features

A dampproof joint can readily be formed with the foundation by rebating top of foundation wall. This is easily done by laying 2"x4" in top of concrete as foundation is being finished. This surface can be treated with hot asphalt or a bonding coat, just before first course of tile is laid.

Pockets for joists, concrete floors, etc., can be easily formed with this tile without weakening the construction or destroying the dampproof or fireproof features of the walls

THE WHITACRE-GREER FIREPROOFING COMPANY

Manufacturers of Hollow Building Tile

WAYNESBURG, OHIO

CHICAGO, ILL., Builders' Building, 228 North La Salle Street

Products

HOLLOW FIRE CLAY BUILDING TILE.

GLAZED BUILDING BLOCKS; RADIAL CHIMNEY BRICK.

Facilities and Production

Our Ohio Plants at Waynesburg, Malvern and Magnolia have a monthly production of 25,000 tons. Our Chicago Heights, Ill., factory, 5000 tons per month.

Quality and Physical Characteristics

Whitacre-Greer Tile is made from the best quality of fire clay which contains a high percentage of silica and alumina, the two components essential for insuring high fire resisting quality. They are burned at a temperature of about 2000° F. Plaster and stucco applied to our tile will not discolor.

Service

We manufacture a *complete line* of all standard sizes and are illustrating a few of the commonly used types on the following page. We maintain our own machine shop and can make up dies promptly for special shapes. No job is too large for us to handle. We give below some of our representative tile jobs:

The White House, Washington, D. C. (700 tons and 49 different sizes and shapes required)

New York Life Insurance Building, New York, N. Y. (15,000 tons), Cass Gilbert, Inc., Architect

Union Trust Building, Cleveland, Ohio (1200 cars, 42,000 tons tile), Graham, Anderson, Probst & White, Architects

and dozens of other similar jobs throughout the eastern portion of the United States.

Specifications

All hollow tile shall be of hard burned dense fire clay as manufactured by THE WHITACRE-GREER FIREPROOFING COMPANY, Waynesburg, Ohio. No badly split, cracked, warped or underburned tile shall be used.

Hollow Tile Fireproofing—The hollow tile fireproofing shall be capable of withstanding the tests prescribed by the National Board of Fire Underwriters' standards for fire resistive floor, wall and partition construction. All arches shall be flat arch end construction with side construction keys and either end or side construction skews. The faces of all tile that are to receive plastering or mortar shall have the standard scoring.

Fireproofing Steel—The thickness of fireproofing around steel members shall be 2 in. for soffit coverings on lower flanges of beams and 2 in. on flanges of all beams or girders extending below the floor arches. Thickness of web covering is to be governed by the dimensions of the girder to be covered, but in no case to be less than 2 in. (The above shall be subject to variation in any particular locality depending upon existing state or municipal ordinances or by-laws).

Tile covering for square or round columns shall be at least 2 in. thick.

Detail Drawings—The contractor shall submit to the architect for approval, detail drawings showing the form and method of applying the fireproofing to the steel work before starting the manufacture of material. Stock shapes shall be used throughout where they conform to the requirements of this specification and fit the contour of the steel.

Partitions—All partitions and division walls other than load bearing walls, shall be constructed of light weight standard scored hollow partition tile of the several thicknesses indicated on drawings. All partitions to be set in cement mortar and bonded by breaking joints at least 3 in. in every course. All partitions under 14 ft. in height shall be 3 in. thick; from 14 to 18 ft. to be 4 in. thick; higher than 18 ft. to be 6 in. thick.

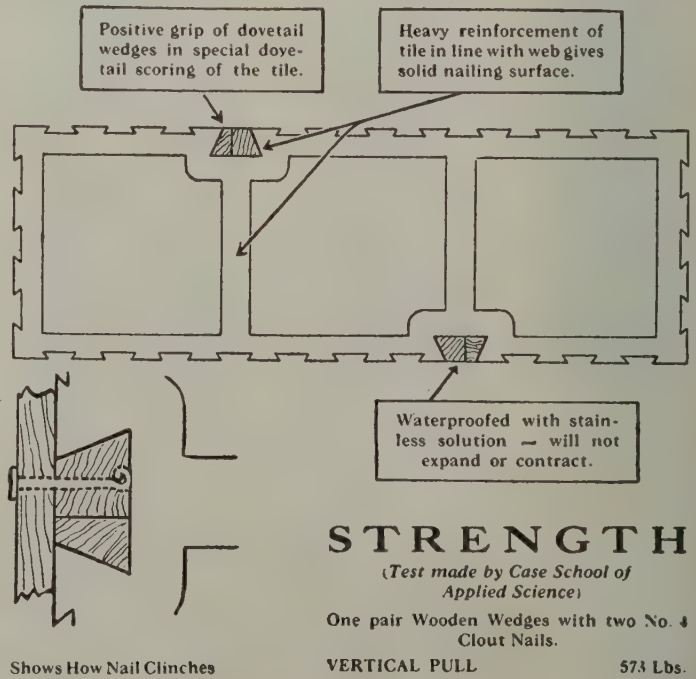
Load Bearing Tile—Standard load bearing tile shall have a heavy dovetail scoring and shall have an absorption of not more than 8%. Wherever possible, these tile shall be laid with cells vertical. All tile shall be capable of sustaining a load of 1200 lb. per sq. in. of gross area when laid with cells vertical.

"Wedge Tile"

"Wedge Tile" feature now supplied *without additional cost* with practically all standard sizes of hollow building tile, including partition, load bearing, perfection, backups, and the 4x5x12 and 8x5x12-in. backups. We also supply 100 pair of wooden wedges and No. 4 clout nails free with every thousand pieces of "Wedge Tile" and ship them in the car with the tile. This is sufficient for the ordinary job. If additional wedges are needed, we can supply them at 1¢ per pair.

"Wedge Tile" provides the *cheapest, strongest* and *most rigid* nailing bases ever devised. A saving to the builder of from 25 to 40% on plaster grounds, nailing blocks and labor.

"Wedge Tile"



Shows How Nail Clinches When it Hits the Tile.

STRENGTH

(Test made by Case School of Applied Science)

One pair Wooden Wedges with two No. 4 Clout Nails.

VERTICAL PULL	573 Lbs.
HORIZONTAL PULL	232 Lbs.

Typical Perfection Header-Backup Tile Construction

Perfection Backup Tile

Made in 6, 8, 10 and 12-in. widths so as to make 10, 12, 14 and 16-in. walls with face brick.

Advantages — Only one size tile on the job. No through mortar joints. Tile made with heavy web and shell, insuring a minimum of breakage in shipment and handling on the job. Nearly as strong as solid brick, yet effects a saving in labor and material of at least 25% over common brick.

Strength — Tests made at Columbia University for load bearing capacity, with following results:

8-in. averaged 2292 lb. per sq. in. gross area—cells horizontal

10-in. averaged 1544 lb. per sq. in. gross area—cells horizontal

12-in. averaged 1664 lb. per sq. in. gross area—cells horizontal.

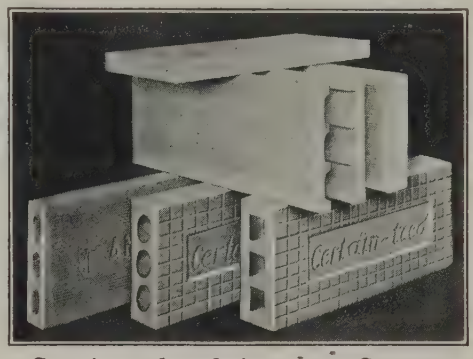
GYPSUM PARTITION AND FURRING TILE

Our gypsum partition and furring tile is now identified under the following brand names: *"Certain-teed"; "Acme"; "American" and "Southern."*

The following data is pertinent to all brands.

Gypsum Tile are used for non-bearing construction in building interiors, such as partitions and wall furring, used as protection against fire on columns, in elevator shafts, stair wells, etc. These Tile possess all the necessary physical requirements for a perfect fireproofing material and in addition are light in weight, permitting easier and faster handling and cutting away of openings in a standard wall if necessary.

Gypsum partition tile are also easily chased for conduits, switch boxes or pipe lines.



Certain-teed and American Gypsum Partition Tile

Grounds may be easily nailed to gypsum tile and bucks may be anchored by nailing with tenpenny cut nails directly into the end of each block course.

Another advantage of gypsum tile to be taken into consideration when designing the structural part of a building is the saving in dead load when using gypsum tile partitions.

Gypsum tile is not only considerably lighter than other tile, but because of the larger units, less mortar is required for setting and due to its uniform moulding in manufacture accurate weight of gypsum is assured and a saving of plaster effected. All these savings tend to lessen the dead load and naturally reduce the cost of construction.

Fire Protection

Gypsum tile have passed the required fire, water and strength tests of the Underwriters' Laboratories, Inc. and have received their approval for non-bearing fireproof partitions, stairways and elevator enclosures, and unplastered non-bearing warehouse partitions.

Three-inch hollow gypsum partition tile plastered with gypsum plaster have been given a two-hour fire retardant rating by the Underwriters' Laboratories, Inc., and three-inch hollow unplastered gypsum partition tile a one hour fire retardant rating.

Non-conductor of Sound

Gypsum partition tile are excellent non-conductors of sound and for that reason are recommended and successfully used in hospitals, schools, office buildings, apartments, hotels and all buildings where a soundproof partition is desired.

Authentic tests determine that less than 1/100 of 1% of incident sound is transmitted through gypsum tile partition plastered with gypsum plaster.

Other Advantages

Gypsum tile by test have been proved to embody maximum density, great crushing strength, supreme fire, sound, and vermin proof qualities, with slight water absorption and negligible breakage.

Certain-teed and *Acme* gypsum tile are marked off by inches both longitudinally and vertically. This feature minimizes labor expense and expedites erection.

Laying

Gypsum unfibered plaster should always be used to lay these blocks. It makes a perfect bond and a stronger wall than either lime or Portland cement mortar. Approximately one-half ton of plaster is required to set a thousand square feet of block.

THICKNESS AND WEIGHTS OF CERTAIN-TEED AND AMERICAN GYPSUM 12x30-IN. BLOCK

Thickness, in.	Ceiling heights up to —, ft.	Weight block per sq. ft., lb.	Weight mortar per sq. ft., lb.	Total Weight* per sq. ft., lb.	
				Plastered 1 side	Plastered 2 sides
1½, split	Furring	4.8	1.4	9.2	12.2
2, split	Furring	6.2	1.4	10.6	13.6
2, solid	10	9.4	1.5	13.9	16.9
3, hollow	13	9.6	2.0	14.6	17.6

GYPSUM PARTITION TILE CONSTRUCTION DETAILS

Specifications for Gypsum Partition and Furring Tile

Work to be Done—All partitions and furring, unless otherwise specified or shown, shall be built of ..... Gypsum Tile as manufactured by CERTAIN-TEED PRODUCTS CORPORATION, of thickness specified.

General—In fireproof construction all Gypsum Tile shall be started with a gypsum mortar bed laid on fireproof construction. Tile courses shall not be started on frozen concrete nor on cinder concrete when such is used for the purpose of fill only.

Partitions—All non-bearing partitions of Gypsum Tile shall be laid with vertical joints broken. Such partitions shall extend from floor to ceiling, shall be wedged at the ceiling, and the joints slushed with gypsum mortar.

Intersections—All intersecting partitions shall be bonded by overlapping not less than at every third course.

Partitions intersecting brick, or other masonry walls, shall be securely anchored to such walls by means of "approved" masonry bond or metal anchors, or by 10d steel cut nails driven into the masonry joints at each gypsum tile course.

Corners—Partitions shall be bonded at the corners by overlapping alternate courses (log cabin fashion).

Furring—Gypsum Tile furring shall be laid as herein required for partitions. All furring in contact with the construction shall be securely anchored to the masonry by means of 10d steel cut nails driven into the masonry joints at intervals not greater than every 3 ft. horizontally and vertically. Free standing furring shall be of not less thickness, nor of greater height, than is required for partitions. Metal ties or other "approved" methods for securing furring to the masonry may be used.

Bucks—*Wood*—Where wood bucks are used they shall be of not less than 2-in. lumber and of a width equal to the total thickness of the tile and plaster constructions, and may or may not be rabbeted to receive the ends of the tile; or the bucks shall be of a width equal to the thickness of tile only and have not less than ½-in. grounds nailed to the sides and projecting beyond the buck not less than ¾ in., forming a rabbet to receive the ends of partition tile.

All wood bucks shall be secured to the ends of the partition tile with 10d cut nails driven into every course.

Metal—Where metal bucks are used they shall be of a width not less than the thickness of the tile construction, and of such form as to receive the ends of the tile. When the metal bucks are of a width equal to the thickness of the tile construction, furring strips of wood shall be secured to the buck as a stop for the plaster coats and for a nailing base for trim. Where metal bucks are of a width to include the total thickness of the tile and plaster construction, the trim shall be secured direct to the metal bucks or to wood nailing blocks bolted to the face of the bucks.

Lintels, Built-up—Openings in partitions of gypsum tile not more than 22 in. in width can be spanned by a gypsum tile. When such openings are more than 22 in. but not more than 4 ft. in width, the gypsum tile over the opening shall be laid in the form of a jack arch. Skew-backs shall be cut in the tile over the jambs, intermediate tile shall be beveled to fit the skew-backs, and a key tile to fit shall be set in the center. Bevel cuts shall not be less than 4 in. to the foot. The skew-back tile shall have a bearing on the jambs of not less than 12 in. nor shall they be set so as to project beyond the face of the jambs more than one-third of the bearing.

When jack arch construction is employed, the jack arch shall be reinforced with strips of not less than No. 14 gauge woven wire mesh not less than 2 in. in width, or the reinforcement may consist of two strips of not less than No. 24 gauge perforated metal not less than 1 in. in width. The reinforcement shall be continuous, and shall be laid in the mortar joint between the jack arch and the course immediately above, extending into the partition construction not less than 30 in. beyond the face of each jamb.

Lintels, Reinforced and Cast—Openings in partitions of gypsum tile which are more than 4 ft. but not over 6 ft. in width shall be spanned by lintels of reinforced gypsum of monolithic design.

(a) Mat Reinforcement—Mat reinforced lintels shall be 12 in. in height and shall be reinforced with a galvanized welded wire mat on each side (face) of the lintel. Each of the welded wire mats required shall consist of not less than three No. 12 gauge wires, for the full length of the lintel, spaced 5 in. on center, the bottom wire shall be 1 in. from the bottom of the lintel. The longitudinal wires shall be secured to transverse wires of not less than No. 12 gauge which shall occur at not less than 9-in. intervals and shall be welded to the longitudinal reinforcement.

(b) Rod Reinforcement—Rod reinforced lintels shall be 12 in. in height and shall be reinforced with not less than two ¼-in. twisted rods for the full length of the lintel. One of the required rods shall be straight and the other shall be bent up for shear. The horizontal part of the reinforcement, at the bottom, shall be 1 in. from the lower face of the lintel and both ends of both rods shall, at their extreme ends, be bent so as to form an anchor within the material.

All reinforced gypsum lintels shall have a bearing on each jamb of not less than 8 in.

Lintels, Metal—Openings in partitions of gypsum tile which are more than 6 ft. in width shall be spanned by metal lintels of approved design.

All metal lintels shall provide a distributed and uniform bearing on each jamb of not less than 8 in.

Mortar—All gypsum tile construction shall be laid up with a gypsum mortar composed of hydrated calcined gypsum thoroughly mixed in the proportions by weight of 1 part calcined gypsum to not more than 3 parts of clean, sharp, dry sand. Gypsum mortar shall not be retempered.

Plastering—All plastering on gypsum tile shall be done with gypsum plasters applied in accordance with the architect's specifications, or the specifications of the CERTAIN-TEED PRODUCTS CORPORATION— see our pages in Sweet's—Plaster Section.

NATIONAL STONE-TILE CORPORATION

Patentees, Licensors and Manufacturers of Stone-Tile
2 Pine Street, SAN FRANCISCO, CAL.
NEW YORK OFFICE, Graybar Building, 420 Lexington Avenue
For Local Licensees, see Telephone Book under "Stone-Tile"

Product
STONE-TILE.

Stone-Tile—A Load Bearing Concrete Tile

Stone-Tile is a pre-cast hollow concrete building unit, smaller and easier to handle than building block or hollow tile. It is one of the most economical materials for permanent, fireproof walls in houses, schools, churches and business or industrial buildings of every description.

Made to Rigid Specifications—The manufacture of Stone-Tile is conducted under Standard Specifications to which each manufacturer must adhere under his license contract. In the Stone-Tile mix the aggregates are graded and the water ratio controlled so as to secure a plastic or *quaking* consistency.

Produced in Quantity—Every Stone-Tile plant is equipped to fill the largest orders on short notice.

Distinctive Texture—Stone-Tile has a distinctive pitted surface which gives a pleasing texture to exterior walls and makes a firm bond with plaster.

Flexible in Treatment—The convenient sizes and shapes of Stone-Tile lend themselves to a wide range of architectural treatment. Can be used to form arches and lintels. See illustrations on following page.

Can Be Reinforced—Stone-Tile pilasters may be filled solid and reinforced where concentrated loads occur and the total cost will be less than reinforced concrete.

Easy to Handle—Stone-Tile units can be handled as easily as common brick. An average bricklayer can lay from 600 to 1200 of 6-in. size, and from 500 to 900 of 8-in. size, depending on nature of the wall.

Extremely Economical—Stone-Tile can be furnished and laid at a price seldom in excess of 35¢ per sq. ft. of 8-in. wall; other sizes in proportion.

A Unit That Meets Every Condition

Stone-Tile Units are furnished in three principal sizes: No. 4 for partitions; No. 6 for 6, 12 or 18-in. walls, and No. 8 for 8 or 16-in. walls. Half tile are also furnished, as well as other shapes listed below.

DIMENSIONS AND WEIGHT OF STONE-TILE

No.	Dimensions, in.	Approx. weight, lb.	Web thickness, in.	Ratio of air space
4	3¾x12x3½	8½	1¼	25%
6	5¾x12x3½	12½	1½	32%
8	7¾x12x3½	16½	1¾	32%

Mortar averages 1 cu. yd. per 1000 Stone-Tile of either size.

For Corners—Special corner tile are furnished in the No. 8 size. No. 6 tile require no special shapes at corners.

For Jambs—Appropriate jamb units (No. 6 or 8) are furnished for use at double hung windows, steel sash, and the like. (See first illustration on left below).

For Copings and Bearing Courses—Solid tile (No. 6 or 8) is used for bearing courses at joist lines and for capping walls at top.

For Arches, Pilasters, etc.—The standard units are adaptable for these purposes. Notice how these details are handled in the church building illustrated below on the left.

Where to Procure Stone-Tile

Because of its strength, economy, pleasing texture and exceptional flexibility of treatment, Stone-Tile is being widely specified by architects. For their benefit we maintain a Service Department at the home office, which will co-operate in plans and specifications.

Stone-Tile can be procured from independent licensees in different parts of the country, by whom it is manufactured under the rigid Stone-Tile specifications.

Look in the telephone book under "Stone-Tile" for your local licensee—or write us for information.

Where Used

Stone-Tile has been and is being successfully and economically used in the following type of structures:

Apartment houses	Factories
Churches	Railroad stations
Residences	Schools
Stores	Theaters
Office buildings	Vaults
Hospitals	Warehouses
Mills	Garages

The illustrations show the beauty, strength and versatility of Stone-Tile.

Wall and Gateway of Stone-Tile

The Stone-Tile are set a little askew, the joints are raked out to give shadow lines and the whole brush coated

Products

Foundation and Wall Bearing Blocks; Partition Tile; Brick; Reinforced Lintels; Sills; Chimney Blocks; Floor Arch Blocks.

Patents and License

The manufacture and sale of cinder concrete building units is protected by United States Patent No. 1,212,840 to Francis J. Straub, and United States Patent No. 1,466,083, to Sigurd Bo. Other patents pending. The Straub patent has been broadly sustained by unanimous decision of the United States Court of Appeals. All plants work under license agreement with National Building Units Corporation.

Advantages

Economy—The lightness of the product effects a 20 to 40% saving over common brick, and 5 to 15% saving over clay tile. One 8x8x16-in. block displaces 12 brick and requires about one-quarter the mortar. Plaster is applied direct to cinder block, and the trueness of the wall, together with the texture, facilitate the application. No nailing strips or plugs are necessary. Other economies will be found under other subheadings.

Tests—Tests made by Underwriters' Laboratories, Inc., Watertown Arsenal, Columbia University, University of Toronto, University of Illinois, Ohio State University, Rutgers College, Johns Hopkins University, Lewis Institute, Pittsburgh Testing Laboratory, Detroit Testing Laboratory, Kansas City Testing Laboratory, E. L. Conwell & Co., Philadelphia, Pa., and other recognized laboratories.

The National Building Units Corporation, or any of the plants listed will send copies of these tests and other pertinent data on request.

Strength—All plants are required to manufacture blocks having an average crushing strength of 800 lb. per sq. in. of gross area, which is equivalent to approximately 1200 lb. per sq. in. net area. Tests on cinder block walls at Columbia University show a ratio of wall strength to unit strength for cinder blocks of from 57 to 76%. This is the highest of any known masonry and consequently, carries a corresponding safety factor.

Continued on next page

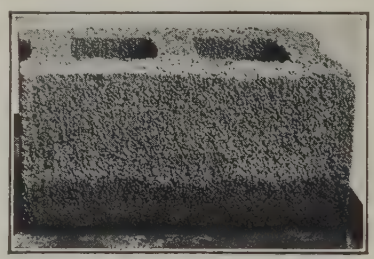
Breakage—Practically no breakage, even when the block and tile are dumped from trucks.

Fireproof—The official tests made for the National Board of Fire Underwriters at the Underwriters' Laboratories, Inc., in Chicago confirm the many demonstrations and results of actual fires. Prolonged exposure to fire and application of water to the wall causes no cracking or spalling, and the loss in strength is negligible.

Timeproof—Age increases the strength of cinder concrete building units. They are not affected by freezing or temperature changes. This is due to the toughness and cellular structure of the material.

Dampproof—The illustration shows the low capillary attraction of cinder blocks. This feature accounts for the fact that no water is drawn through the wall, even during the heaviest rain storm. It is also of importance in producing a stronger mortar joint in that the mortar is not robbed of its moisture. For the same reason, stucco and plaster retain full strength on cinder concrete building units. The initial suction or absorption is rapid but limited. No wetting is necessary. The laying of these blocks during the winter months is thus made practicable.



Cinder Building Block Partly Immersed in Water
Illustrating the low capillary attraction of the material

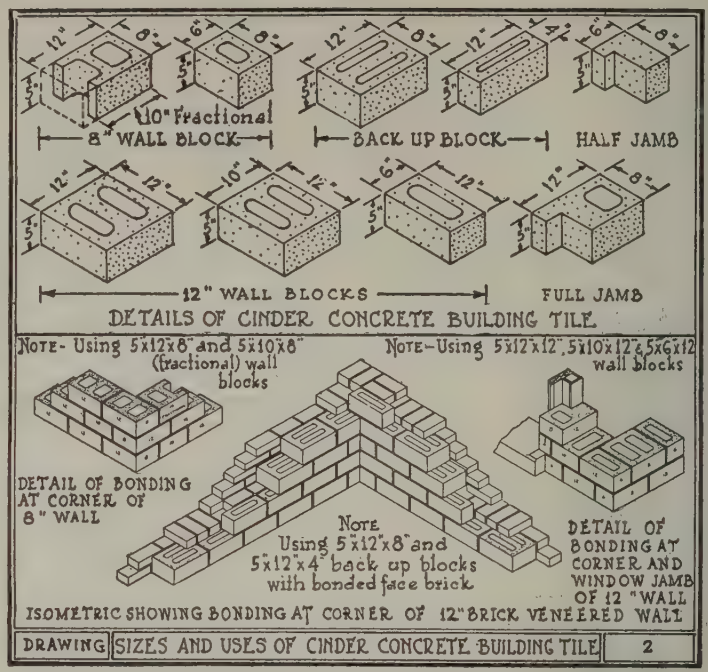
Non-conductor of Heat and Cold—The cork-like structure of the material builds insulation into the wall. It insures an even temperature within the house all year round and effects a substantial saving in fuel. The insulative nature makes lining with special insulative materials unnecessary. Cinder concrete building units never "sweat"; are rotproof and verminproof; no mold forms, and decorations are never injured where plaster has been applied direct to exterior walls, even in the severest climate. The material is ideal for icehouses, refrigeration plants, fruit storage, dry kilns, etc.

Soundproof—Cinder blocks are used extensively in schools, hospitals, churches, and the like where the acoustic design is of particular importance. A wall of this material, exposed or plastered, reduces the reverberation and absorbs the sound. Cinder tile forms the ideal partition, because it reduces the amount of sound transmission more than any other masonry material.

Stucco and Plaster—The rough texture affords a perfect key for plaster and stucco. These materials are readily applied and dovetail into the small crevices on the surface of the cinder block or tile.

No Through Mortar Joints—Cinder block and tile are always buttered on the outside and the inside webs, but not on the cross webs. Through mortar joints, with their tendency to conduct moisture, heat and cold through the wall are thereby avoided.

No Furring Required—The low capillary attraction and the high degree of heat insulation of cinder concrete building units make it possible to plaster direct without any furring or lathing.



Light of Weight—From 30 to 40% lighter than sand concrete. The hollow units 50 to 60% lighter than brick. This speeds up the laying and reduces the dead load of the wall.

Rapid Laying—Light weight, uniformity and a good mortar bed contribute to easy, rapid and economical wall erection. Less waste of mortar or time of setting than with clay tile.

Nailing—As good as wood for nailing; holding power is equal to yellow pine. Nails never rust. See Pittsburgh Testing Laboratory report. Holding power increases by age. Wood ground and trim can be thoroughly secured by toe nailing. Pipe hangers and other supporting members can be readily secured by means of lag screws, expansion bolts, etc.

Cutting—Cinder concrete building units are furnished in all fractions. They can, however, be readily cut and they can be chased and channeled for pipe and conduits without fracture.

Corners—Details of this on preceding page show several methods, all retaining full insulating value.

Steel Sash Installation—Grooves are moulded into jamb blocks to admit steel window frames. Two lintels to an opening provide this advantage without cutting or channelling.

Lintels—Reinforced lintels of cinder concrete provide all the advantages of strength, lightness, nailability and dampproofness.

Several standard sizes—see drawing No. 1. Specials on order.

Details, Catalogues and Data

Each plant is in position to submit details and give required information to architects, engineers and builders.

THE STOCKADE CORPORATION

228 North La Salle Street

CHICAGO, ILL.

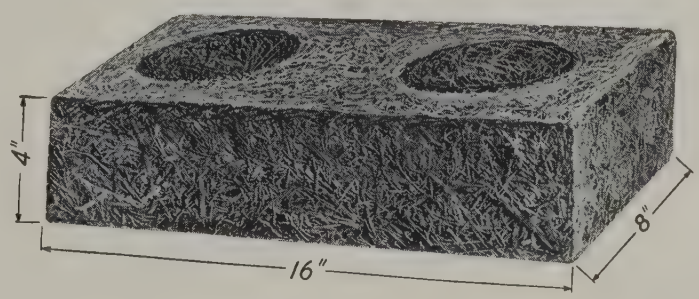
Product

STOCKADE BUILDING UNITS for Exterior Walls.

Description

Stockade is a wall-building material that received immediate approval from America's leading architects.

It is manufactured in blocks that are eight times larger than bricks and one-eighth as light in weight (see illustration). These blocks, in wall construction, are built up in brick fashion—only much faster because of the larger size, the light weight and because the joints take care of themselves—self-bonding.



The circular opening in each block forms a "column of holes" as the wall is laid. Concrete is poured into these holes, forming re-inforced concrete columns four inches in diameter and eight inches on centers. A test conducted at Armour Institute of Technology proved that a wall so constructed had the astounding strength of 67,000 pounds a lineal foot at eight feet high.

Stockade blocks provide an eight inch thickness of continuous, integral insulation equal to a two-inch layer of cork, more insulation than has been heretofore practical. It is fire resistant, moistureproof and verminproof. Does not disintegrate with time.

Advantages

(1) The strength of re-inforced concrete made practical for the modern home.

(2) Much more insulation at no extra cost.

(3) Any exterior or interior wall treatment without lath, furring strips or extra operations.

(4) Unusual architectural effects possible, deep reveals, at amazing small cost.

(5) No extra tools needed in using Stockade, only a saw is required.

Economy

Elimination of various wall materials—when stockade mould is laid, it is immediately ready for stucco and plaster.

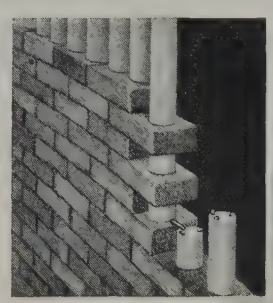
Substantial saving in labor because Stockade can be laid rapidly and is self-bonding.

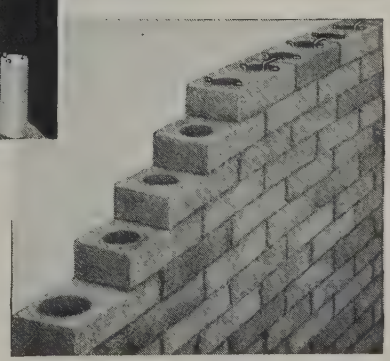
Quality

Stockade was invented by the well-known architect, James Monroe Hewlett. It is the result of extensive engineering and chemical research and is a product of the finest workmanship, true to size, shape and unchanging high quality.

Additional Information

Illustrated booklets and sample will be sent to contractors, builders and architects. Or when advice is desired regarding practice of construction, it will be cheerfully furnished by our engineers.





UNITED STATES GYPSUM COMPANY

Pyrobar Partition and Furring Tile; Beam and Column Covering

Service

We are the largest producers and manufacturers of gypsum products in the world. Our mills, economically distributed throughout the country, insure prompt delivery of any quantity of Pyrobar Tile.

We contract for the furnishing and erecting of Pyrobar partition tile, furring tile and fireproofing of beams and girders, and for all interior partition work complete.

Pyrobar Partition and Furring Tile

Moulded of 98% gypsum and 2% special fiber by continuous automatic machine process, insuring accurate proportions and uniform size, weight, strength, and density.

Approved by Underwriters' Laboratories, Inc., for:

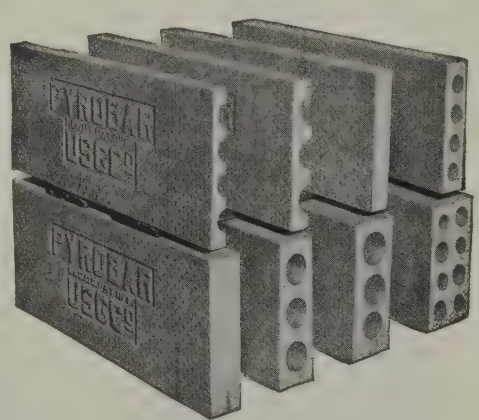
Non-bearing corridor walls, partitions, wall furring, false columns and pilasters, unplastered partitions and corridors in merchandise storage warehouses. Fire division walls. Elevators, stairways, dumbwaiter and corridor enclosures. Light wells, pipe chases, heat and vent ducts. As covering for columns, beams, girders and trusses and other steel members requiring fireproofing.

Advantages—

Fireproof	Light weight	Economical
Save plaster.	Speedily erected	Sound resistance
Perfect plaster base	Easily cut for alterations	

Distinctive Economy—Pyrobar units are 2½ sq. ft. each, speeding construction and making for economy in handling and erection costs. Pyrobar walls are straight and true, requiring uniform ½ in. of plaster on a side to finish.

Cost—Its extreme light weight and large, true units secure economy in freight, labor, handling, erection, and plastering. Note the comparisons.



Pyrobar Precast Gypsum Partition and Furring Tile

Approved by Underwriters' Laboratories, Inc.

Specifications for Pyrobar Partition and Furring Tile

Partitions—Unless otherwise specified or shown, all non-bearing partitions (*Note:* also mention vent shafts, pipe chases, column fireproofing or any other special items required with partitions) shall be built of UNITED STATES GYPSUM COMPANY'S Pyrobar Partition Tile, of thickness indicated on plans. All partitions shall start with a mortar bed, and the tile shall be set plumb, straight and true with vertical joints broken, and shall be wedged at ceiling and slushed with mortar. Corners of all partitions shall be built log cabin fashion, tile interlocking.

All partitions coming in contact with existing walls or partitions or with brick or other masonry walls shall be securely anchored to such walls by means of metal ties, anchor straps or other approved fasteners furnished and set by the masonry contractor, or by providing recess in wall.

Furring—All outside walls, where so shown on plans, shall be furred with Pyrobar Furring Tile of thickness and type indicated on plans, laid up against the wall, and securely anchored to the masonry every square yard with 10d cut nails, metal ties, anchor straps or other approved fasteners left in place by mason contractor.

Mortar and Laying—All Pyrobar Tile shall be laid up in mortar composed of UNITED STATES GYPSUM COMPANY'S Set-fast Cement—1 part cement to 3 parts, by weight, of clean, sharp dry sand, thoroughly mixed. *(Important: Do not use portland cement or lime mortar.)* No mortar shall be retempered. All tile shall be laid with full, flush joints to a line, with horizontal beds uniformly level on each course. All joints, chinks, and crevices between the tile and other work shall be filled with mortar well slushed in.

Grounds for Trim—Chair rail, picture moulding, plaster grounds, baseboards and similar trim shall be secured to grounds or to nailing blocks set in the tile construction for this purpose. Nailing blocks shall not be less than ⅞ in. thick, shall be nailed directly to the end of the gypsum tile and shall be of such other dimensions as to completely cover the end of the tile. When nailing blocks are used, they shall be spaced not to exceed 30 in.

Blackboards, toilet and heavy fixtures shall be secured by bolting through the tile construction, or shall be nailed to nailing blocks not less than 1½ in. thick of the character required for other trim, and spaced not to exceed 15 in.

Lintels—Openings not greater than 22 in. in partitions of tile may be spanned with a single tile, which shall have a bearing at each end of not less than 4 in. When such openings are more than 22 in. but not more than 4 ft., the Pyrobar Tile over these openings shall be laid in the form of a jack-arch. Openings over 4 ft. but not over 6 ft. shall be spanned by reinforced gypsum lintels. Openings over 6 ft. shall be spanned by metal lintels of approved design. *(Note: Specify under Miscellaneous Iron.)*

Wood Frames—(For Carpenter Specifications)—The carpenter contractor shall set and secure the rough bucks for openings ahead of the contractor for this work so as to cause no delay. These bucks shall be left plumb and true by the carpenter and shall be made of 2-in. lumber of the same width as the thickness of the tile, and there shall be ½x2¾-in. grounds nailed to the bucks to the height of the door forming a rabbet to receive the Pyrobar Tile.

Trim—(For Carpenter Specifications)—All wood or metal trim shall extend over the junction between bucks or grounds and the plaster coats. For narrow trim an unrabbetted buck may be used if securely anchored to the tile.

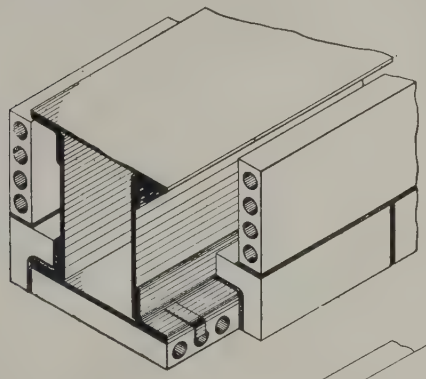
Note: For best construction, we recommend the use of door bucks which extend from floor to ceiling, and preferably anchored to the tile by means of metal ties, anchor straps, other approved fasteners or by 10d steel cut nails partially driven into the buck at each gypsum tile course. Bucks not extending to ceiling should always be well anchored. It is good practice to use a strip of metal lath, corrugated or perforated iron or a wire mesh in the mortar course over the tiles forming the lintel and extending 30 in. beyond the joint on each side. Where heavy doors are

Continued on next page

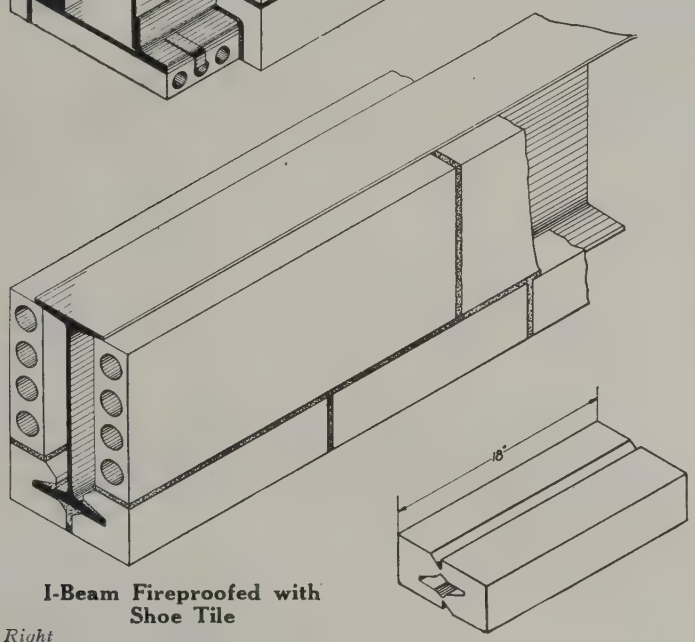
used, the plaster may be reinforced against cracking by use of a metal lath or wire mesh facing, nailed to the tile, over the corners of the door openings.

Pyrobar Column Fireproofing

Column fireproofing is accomplished with 2-in. solid or 3-in. hollow Pyrobar partition tile. When desired or required by code, the space between the covering and the steel may be solidly backfilled with broken gypsum blocks and gypsum mortar.



Built-up Girder Fireproofed with Angle and Soffit Tile



I-Beam Fireproofed with Shoe Tile

Right
Sketch of shoe tile as shipped to the job

Pyrobar Beam and Girder Fireproofing

Pyrobar beam and girder fireproofing consists of shoe tile which fit closely over the lower flanges of the steel, as illustrated, and side covering of Pyrobar partition units set in place as shown. Both shoe tile and side covering are of such dimensions as to provide 2 in. of fireproofing at all parts, thus fulfilling the requirements of the Underwriters Laboratories, Inc.

For built-up girders larger than may be accommodated with the standard sizes of shoe tile, a combination of angle and soffit tiles are used. The soffit pieces are usually cut to fit on the job from Pyrobar partition tile.

Shoe tile are machine moulded in a double unit 18 in. long and are easily split by the mason into the two individual units. The advantages of the double unit are less breakage, easier and less expensive to handle and the protection afforded the inner edges. The large light weight units facilitate rapid handling and decrease setting costs, require a minimum of mortar and a minimum of labor to place. The true, protected inside faces will be found to fit closely around the beam and girder flanges.

Fireproofing Efficiency

Authorities recognize that fireproofing the building members carrying the load is essentially a matter of insulating them from the effect of high temperatures. Steel commences to lose its strength at about 800° F. and the importance of an insulative fireproofing material cannot be over estimated.

Pyrobar gypsum tile do not burn or support combustion. Their low coefficient of conductivity will not permit the passage of heat sufficient to ignite inflammable materials on the side away from the fire. They will not expand sufficiently under actual fire conditions to cause warping, bulging, buckling and disruption of the structure in which they are a part.

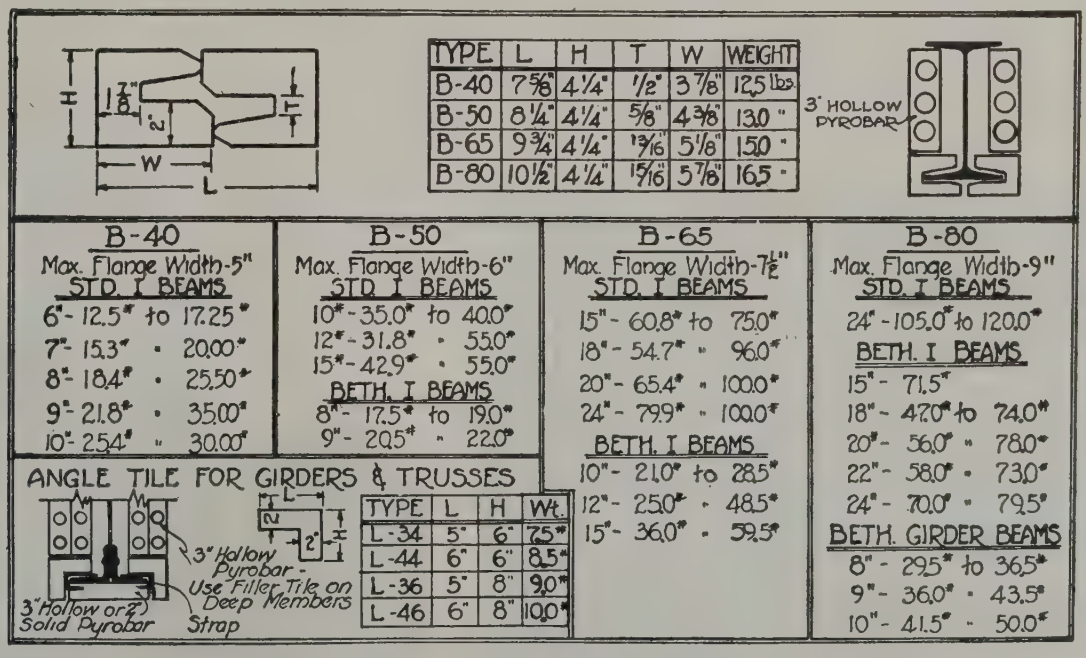
The tests of the Bureau of Standards and Underwriters Laboratories, Inc., definitely show, and their reports state, that *with gypsum fireproofing the maximum temperature in the steel was much lower than those obtained in comparable tests with other covering materials.**

Specifications for Pyrobar Gypsum Beam, Column and Girder Fireproofing

Girder and Truss Covering—All girders, beams and trusses, unless otherwise specified, shall be covered with Pyrobar Beam Shoe, or Angle and Soffit Tile in accordance with the standards of the United States Gypsum Company.

Mortar and Laying—See specification for mortar and laying Pyrobar Tile on preceding page.

*Digest of report giving comparable tests on clay tile, concrete and gypsum fireproofing available upon request.



Weights and Sizes of Pyrobar Beam and Girder Fireproofing

Per lineal foot of tile

New series Carnegie and Bethlehem Beam Section with a flange width of not over 9 in. can be fireproofed with the type of shoe tile corresponding to the flange width

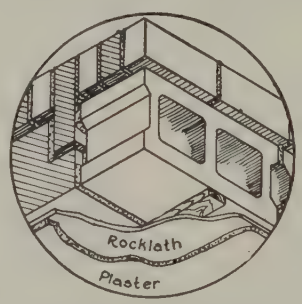
STRUCTOLITE

Reg. U. S. Pat. Off.

Insulating Load-Bearing Tile
Quick Set, Light Weight Cement



Wall Section Showing Structolite Load Bearing Tile with Brick Exterior

Structolite Tile

Description—Structolite Tile are a fireproof, load bearing tile. They are manufactured of neat Structolite cement, without aggregates, are easily cut, and can be readily nailed into. Standard sizes are 8x16-in. face, with 6 and 8-in. thickness and 8x12-in. face with 4-in. thickness. All sizes are available in bond tile for backing up brickwork. The 8-in. unit weighs about 25 lb., the 6-in. about 20 lb., and the 4-in. about 12 lb. This light weight combined with their smooth surface makes them particularly easy to handle. Manufactured completely under the careful supervision of the United States Gypsum Company, they are uniform in size, shape, strength and quality.

Insulation—Insulation is an outstanding feature in walls of Structolite Tile construction.

Based on tests made by Peebles of Armour Institute and values from A. S. of H. V. E. Guide, the heat transmitted per square foot per hour, per degree difference Fahrenheit, through Structolite walls has been calculated as follows:

6 in. Structolite Tile, furred, lath and plastered, stuccoed over paper backed mesh	.165 B.t.u.
8 in. Structolite Tile, same as above	.154 B.t.u.
4 in. brick face, 1½ in. air space, 4 in. Structolite Tile (9½ in. wall) furred, lathed and plastered	.133 B.t.u.
6 in. clay tile, furred, lathed and plastered, stucco on the outside	.202 B.t.u.
8 in. clay tile, same as above	.190 B.t.u.
8 in. solid brick, plastered	.332 B.t.u.
8 in. solid brick, furred, lathed and plastered	.215 B.t.u.
Brick veneer over frame, not insulated, lathed and plastered	.216 B.t.u.

Fireproofness—Structolite Tile do not burn, will not transmit heat at high temperatures, and do not expand or contract under the action of the fire.

Adaptability—Structolite Tile are readily cut with a saw, or a mason's trowel. They are adaptable to any type of construction. Fewer shapes and sizes are required, decreasing the handling and erection costs. Manufactured from gypsum rock by a special process, Structolite develops a strength of 2000 lb. per sq. in., more than ample for exterior load bearing wall requirements.

Exterior Finishes—Exterior finishes may be of brick, stucco, stone or siding as the cost and appearance of the building requires. Practically any type of architectural finish can be applied easily and economically.

Value—Structolite Tile are economical to use. They result in better construction; are fireproof, and result in no added cost over types of masonry or combustible construction with special insulation.

Structolite Cement for Fireproof Slab Construction, Sleeper Fill, Fireproof Wall, and Fireproofing Structural Steel

Structolite Concrete—A mixture of "Structolite Cement" with a coarse aggregate of stone, gravel, blast furnace slag, or similar material, and sand.

Structolite cement is mixed on the job with water and the aggregate in a concrete mixer and poured into place similar to ordinary portland cement concrete.

Structolite concrete is being used for floor and roof slabs over steel joists, sleeper fills, saddle fills, fireproofing structural steel, and fireproof walls in apartments and residences. Its economy for these purposes is a strong argument for its use. The light weight of Structolite saves steel. Its quick set speeds construction. When the usual precautions of heating the mixing water, and removing the frost from the aggregates are employed, the Structolite concrete will set before it freezes, at working temperature.

Details, Booklets, Service

Details illustrating the use of the above products, and further descriptive literature are available on request.

Our Engineering Department will give prompt attention to special details or designs involving the use of Structolite Tile and Structolite cement. This service is free and you are invited to avail yourself of its use.

Certain-teed Highest Quality Roofing Products

Nothing is omitted which can safeguard the quality of Certain-teed products. They are manufactured according to tried and proved formulas under the watchful supervision of experts. Only the best materials are used and each is carefully tested to make certain that it is of the required quality. You can rely on products bearing the Certain-teed label—it is a sure guide to satisfaction.

There is a Certain-teed roofing for every type of building—from temporary shelters to the most expensive structures. For built-up roofs of Certain-teed roofing, felts and asphalt see page A448.

Facilities and Distribution

Certain-teed products are handled by jobbers and dealers throughout the United States and in principal countries throughout the world.

Certain-teed Smooth Surface Roll Roofing

Certain-teed roofing is a first grade product manufactured by the CERTAIN-TEED PRODUCTS CORPORATION. Millions of squares are giving satisfactory service in all parts of the world under all conditions—from the extreme cold of the northern frontiers to the intense heat of the tropics.

There are many large important buildings throughout the world that are sheltered by Certain-teed roofs. Certain-teed was the choice for the roofs of the Pullman shops, the General Motors Company at St. Louis, Mo., etc.

Owners, architects and builders of such roof areas as these insist upon knowing before it is laid that the roofing will give long years of protection. They can rely on Certain-teed, the highest quality possible to manufacture, as long years of service and world-wide use have proved.

Put up in rolls of 108 sq. ft. Nails and cement are enclosed in the roll. Packed one square per roll—enough to cover 100 sq. ft. of roof surface with 8 sq. ft. for laps.

No. 1, light, about 35 lb. per square, guaranteed 5 years.
No. 2, medium, about 45 lb. per square, guaranteed 10 years.
No. 3, heavy, about 55 lb. per square, guaranteed 15 years.
No. 4, extra heavy, about 65 lb. per square, guaranteed 15 years.

Certain-teed Slate Surfaced Roll Roofing

Made from the same high grade felt used in Certain-teed smooth surfaced roofing. Surfaced with non-fading red, green, blue-black and color blend crushed slate. It is widely used on residences, bungalows, garages, etc., where a decorative roof at minimum expense is desired. Guaranteed ten years.

Put up in rolls of 108 sq. ft. Weight 85 to 90 lb.

Certain-teed Asphalt Felt

It is used extensively under slate, tile, asbestos shingles and other roofing materials requiring a waterproof sheathing or liner. It is extensively used for all sheathing and insulating purposes as it is absolutely waterproof and verminproof. It is also preferable to tarred felt as the felt layer in built-up roofs. It has the advantage of longer life than tarred felt.

Certain-teed asphalt felt is made in the following weights:

No. 15, 432 sq. ft., about 65 lb. per roll.
No. 30, 216 sq. ft., about 60 lb. per roll.

Certain-teed Insulating Paper

For insulating and sheathing against heat, cold, sound or moisture. A product superior to ordinary sheathing paper which is not moisture-proof, tarred saturated paper, etc. Saturated and coated; jet black and has a glossy finish. Waterproof and verminproof. When used for house lining, between double floors, etc., it saves fuel in winter and keeps out heat in summer. Used for residences, stores and industrial structures. Also used for refrigerator linings in dairies, refrigerators and icehouses and for packing cases, etc.

Furnished 36 in. wide, in rolls containing, approximately, 500 sq. ft. Made in two weights: Medium, about 35 lb. per roll; Heavy, about 50 lb. per roll.

Certain-teed Sheathing Paper

An inexpensive, non-waterproof sheathing paper used as a liner under clapboards, shingles, siding, etc. Put up in rolls 36 in. wide of approximately 500 sq. ft. in the following weights:

No. 20 about 20 lb.; No. 25 about 25 lb.; No. 30 about 30 lb.; No. 35 about 35 lb.; No. 40 about 40 lb.

Certain-teed Deadening Felt

A thick felt for laying between double floors and in walls for insulating against sound, heat and cold. It is made in 50 yard rolls 36 in. wide in the following weights:

No. 40, about 40 lb. to roll.
No. 50, about 50 lb. to roll.
No. 75, about 75 lb. to roll.

Certain-teed Asphalt Roof Coating

For re-saturating asphalt roofing (smooth surfaced). Renews the life of the roofing and, if applied at intervals of from three to five years, will preserve the roofing almost indefinitely. For waterproofing exterior of basement walls. Cellar walls may be waterproofed by applying the coating on the outside of the walls below grade. The walls should be free from dirt or other foreign substance before applying.

ATP Products

ATP Roofs, with or without 20-year or 10-year guarantee bonds.

ATP Old Style Pitch (Underwriters' Label) for built-up roofing.

ATP Approved Tarred Felt (Underwriters' Label), weight 15 lb. per 100 sq. ft., for built-up roofing.

ATP No. 3 Tarred Felt, weight 13 lb. per 100 sq. ft., for built-up roofing.

ATP Waterproofing Pitch for membrane waterproofing or damp-proofing.

ATP Damp-proofing Paint, for cold applications.

ATP High Penetration waterproofing materials.

ATP Sub-floor Tar, prepared to protect wooden floor against vermin, decay and dampness. Can be used over concrete (Grade 2) or over cinders or natural earth (Grade 2 with top coat of Grade 1).

ATP Roof Cements; Fiber Coatings; Metal Paint; Wood Preserver, etc.

Features of the ATP Roof

An ATP Roof is a long-lived, low-cost roof built of pure coal-tar-pitch and the highest grade of tarred felt, armored on top with gravel or slag. It withstands the severest weather conditions for 20, 30—even 40 years, and takes Class A rating of Underwriters.

ATP Roofs are available with or without a 10 or 20-year guarantee bond. Whether bonded or not, any ATP Roof is identical—the materials and specifications are the same. There is a flat charge per square for the bond.

See "Specifications for ATP Roofs"—A.I.A. File 12b11.

Why You Should Specify an ATP Roof

The American Railway Engineering Association and the American Railway Bridge & Building Association, after a very thorough investigation, recommended to their members the use of coal-tar-pitch and gravel-surfaced roofs in preference to other types of roofs that are applicable to a flat surface. Gravel or slag absorbs the action of the elements, allowing the waterproofing material to carry on only one function, that of waterproofing. On roofs without a surfacing material, the waterproofing material must absorb the action of the elements, thus shortening the life of the roof.

The expansion and contraction of the roof under the influence of heat and cold, and movement of the deck, have a serious effect upon a roof unless the materials have high ductility. On ATP Roofs it is not necessary to use a heavy bottom ply of felt to keep the bitumen from cracking. Pitch has much greater ductility than other roofing materials.

A coal-tar-pitch roof will heal itself at the first warm weather. This is one of the distinctive qualities of pitch; it welds itself and seals up any minor cuts, tears or cracks.

ATP Approved Tarred Felt is made from the best quality of dry felt. It is saturated with a pure dehydrated coal tar, thus insuring a uniform finished product of maximum lasting qualities. The felt is thoroughly seasoned before shipment.

ATP ROOFS

ATP WATERPROOFING

ATP Old Style Pitch is distilled from pure coal tar and positively contains no asphalt. Its uniformity is assured by a large supply of crude tar.

Both of these materials are the result of many years' experience and much research. Both are listed by the Underwriters and meet all standard specifications and requirements, such as U. S. Government Master Specifications.

How to Specify an ATP Roof

Choose the type of roof that you wish from one of the fourteen specifications for ATP Roofs:

5-Ply Over Boards
4-Ply Over Poured Concrete
4-Ply Over Precast Concrete
4-Ply Over Precast Gypsum
4-Ply Over Book Tile
4-Ply Over Poured Gypsum
5-Ply Over Precast Gypsum
4-Ply Over Level Surface
4-Ply Over Boards
3-Ply Over Poured Concrete
3-Ply Over Precast Concrete
3-Ply Over Poured Gypsum
3-Ply Over Book Tile
5-Ply Over Concrete Under Promenade Tile Surface

This entire set of specifications is printed by the American Tar Products Company *and if there is not a copy in your A.I.A. File 12b11, one will be mailed to you.*

Suppose you choose a four-ply roof over a poured concrete deck. Simply specify "ATP Roof, 4-ply over poured concrete." If you want a 20-year guarantee bond, just add to your specifications, "The roofing contractor must furnish an ATP 20-year Guarantee Bond." Or a more simple form is, "ATP Roof, 4-ply over poured concrete, with bond." You will find a brief form of specification in the book of specifications above referred to.

Specifying in this manner insures long and dependable service and lowest last cost.

For equality in specifications, place any 3-ply ATP Roof over concrete, tile or gypsum equal to *any* smooth surface roof.

Specifications for ATP Roofs

The specifications that are recommended above are standard specifications and have been in use for many years by most architects and roofing contractors.

The following are the more commonly used roofing specifications:

5-Ply Over Boards

Deck—The roof deck shall be clean, smooth, free from knotholes, large cracks, and loose boards. The lumber shall be seasoned. If the roof deck is inclined, it shall be properly graded to the outlets. In such cases, the incline shall not exceed two (2) inches to the foot.

Materials—There shall be used one (1) thickness of unsaturated felt or sheathing paper, weighing not less than five (5) pounds per one hundred (100) square feet, and five (5) thicknesses of ATP Approved Tarred Felt weighing not less than fourteen (14) pounds per one hundred (100) square feet, single thickness, and for each one hundred (100) square feet of completed roof there shall be used not less than one hundred and fifty (150) pounds of ATP Old Style Pitch and not less than four hundred (400) pounds of gravel, or three

Continued on next page

hundred (300) pounds of slag, from one-fourth (¼) to five-eighths (⅝) inch in size. The gravel and slag shall be dry and free from dirt. The ATP Old Style Pitch shall not be heated above four hundred (400) degrees Fahrenheit.

Application—The material shall be applied as follows:

Lay one thickness of unsaturated felt or sheathing paper, lapping each sheet one (1) inch over the preceding one.

Lay over the entire surface two (2) full thicknesses of ATP Approved Tarred Felt, lapping each sheet seventeen (17) inches over the preceding one. Nail as often as may be necessary to hold the sheets in place until the remaining felt is laid. The ATP Approved Tarred Felt shall be laid without wrinkles or buckles.

Apply over the entire surface a uniform coating of ATP Old Style Pitch.

Lay over the entire surface three (3) full thicknesses of ATP Approved Tarred Felt, lapping each sheet twenty-two (22) inches over the preceding one and mopping with ATP Old Style Pitch the full width of the twenty-two (22) inch lap, so that in no place shall felt touch felt. All nails shall be covered by not less than two (2) plies of ATP Approved Tarred Felt.

Pour over the entire surface a uniform coating of ATP Old Style Pitch into which, while hot, embed gravel or slag.

Bond—If an ATP 20-Year Guarantee Bond is required, the roof shall be inspected by an authorized ATP Inspector who shall cut the roof as he considers necessary. Such cuts shall be made before any slag or gravel is applied.

BRIEF FORM OF SPECIFICATION

The roof shall be an ATP Roof, 5-ply over boards, applied according to "Specifications for ATP Roofs."

(Where bond is required, add this sentence.)

An ATP 20-Year Guarantee Bond shall be furnished by the roofing contractor.

4-Ply Over Poured Concrete

Deck—The roof deck shall be smooth, dry, firm and clean. If the roof deck is inclined, it shall be properly graded to the outlets. In such cases, the incline shall not exceed one (1) inch to the foot.

Materials—There shall be used four (4) thicknesses of ATP Approved Tarred Felt, weighing not less than fourteen (14) pounds per hundred (100) square feet, single thickness, and for each one hundred (100) square feet of completed roof there shall be used not less than two hundred (200) pounds of ATP Old Style Pitch and not less than four hundred (400) pounds of gravel or three hundred (300) pounds of slag from one-fourth (¼) to five-eighths (⅝) inch in size. The gravel and slag shall be dry and free from dirt. The ATP Old Style Pitch shall not be heated above four hundred (400) degrees Fahrenheit.

Application—The material shall be applied as follows:

Apply a uniform coating of ATP Old Style Pitch to the concrete.

Lay over the entire surface four (4) full thicknesses of ATP Approved Tarred Felt, lapping each sheet twenty-four and one-half (24½) inches over the preceding one, mopping with ATP Old Style Pitch the full twenty-four and one-half (24½) inches on each sheet so that in no place shall felt touch felt. The ATP Approved Tarred Felt shall be laid without wrinkles or buckles.

Pour over the entire surface a uniform coating of ATP Old Style Pitch, into which, while hot, embed gravel or slag.

Bond—If an ATP 20-Year Guarantee Bond is required, the roof shall be inspected by an authorized ATP Inspector who shall cut the roof as he considers necessary. Such cuts shall be made before any slag or gravel is applied.

BRIEF FORM OF SPECIFICATION

The roof shall be an ATP Roof, 4-ply over poured concrete, applied according to "Specifications for ATP Roofs."

(Where bond is required, add this sentence.)

An ATP 20-Year Guarantee Bond shall be furnished by the roofing contractor.

4-Ply Over Boards

Deck—The roof deck shall be clean, smooth, free from knotholes, large cracks and loose boards. The lumber shall be seasoned. If the roof deck is inclined it shall be properly graded to the outlets. In such cases, the incline shall not exceed two (2) inches to the foot.

Materials—There shall be used one (1) thickness of unsaturated felt or sheathing paper weighing not less than five (5) pounds per one hundred (100) square feet, and four (4) thicknesses of ATP Approved Tarred Felt weighing not less than fourteen (14) pounds per hundred (100) square feet, single thickness, and for each one hundred (100) square feet of completed roof there shall be used not less than one hundred and twenty-five (125) pounds of ATP Old Style Pitch and not less than four hundred (400) pounds of gravel, or three hundred (300) pounds of slag from one-fourth (¼) to five-eighths (⅝) inch in size. The gravel and slag shall be dry and free from dirt. The ATP Old Style Pitch shall not be heated above four hundred (400) degrees Fahrenheit.

Application—The material shall be applied as follows:

One (1) thickness of unsaturated felt or sheathing paper shall be laid, lapping each sheet one (1) inch over the preceding one.

Lay over the entire surface two (2) full thicknesses of ATP Approved Tarred Felt, lapping each sheet seventeen (17) inches over the preceding one. Nail as often as may be necessary to hold the sheets until the remaining felt is laid. The ATP Approved Tarred Felt shall be laid without wrinkles or buckles.

Apply a uniform coating of ATP Old Style Pitch.

Lay over the entire surface two (2) full thicknesses of ATP Approved Tarred Felt, lapping each sheet seventeen (17) inches over the preceding one and mopping with ATP Old Style Pitch the full width of the seventeen (17) inch lap so that in no place shall felt touch felt. All nails shall be covered by not less than one (1) ply of ATP Approved Tarred Felt.

Pour over the entire surface a uniform coating of ATP Old Style Pitch, into which, while hot, embed gravel or slag.

Bond—If an ATP 10-Year Guarantee Bond is required, the roof shall be inspected by an authorized ATP Inspector who shall cut the roof as he considers necessary. Such cut shall be made before any slag or gravel is applied.

BRIEF FORM OF SPECIFICATION

The roof shall be an ATP Roof, 4-ply over boards, applied according to "Specifications for ATP Roofs."

(Where bond is required, add this sentence.)

An ATP 10-Year Guarantee Bond shall be furnished by the roofing contractor.

3-Ply Over Poured Concrete

Deck—The roof deck shall be smooth, dry, firm and clean. If the roof deck is inclined, it shall be properly graded to the outlets. In such cases, the incline shall not exceed one (1) inch to the foot.

Materials—There shall be used three (3) thicknesses of ATP Approved Tarred Felt, weighing not less than fourteen (14) pounds per hundred (100) square feet, single thickness, and for each one hundred (100) square feet of completed roof there shall be used not less than one hundred and seventy-five (175) pounds of ATP Old Style Pitch and not less than four hundred (400) pounds of gravel or three hundred (300) pounds of slag from one-fourth (¼) to five-eighths (⅝) inch in size. The gravel and slag shall be dry and free from dirt. The ATP Old Style Pitch shall not be heated above four hundred (400) degrees Fahrenheit.

Application—The material shall be applied as follows:

Apply a uniform coating of ATP Old Style Pitch to the concrete.

Lay over the entire surface three (3) full thicknesses of ATP Approved Tarred Felt, lapping each sheet twenty-two (22) inches over the preceding one, mopping with ATP Old Style Pitch the full twenty-two (22) inches on each sheet so that in no place shall felt touch felt. The ATP Approved Tarred Felt shall be laid without wrinkles or buckles.

Pour over the entire surface a uniform coating of ATP Old Style Pitch, into which, while hot, embed gravel or slag.

Bond—If an ATP 10-Year Guarantee Bond is required, the roof shall be inspected by an authorized ATP Inspector who shall cut the roof as he considers necessary. Such cuts shall be made before any slag or gravel is applied.

BRIEF FORM OF SPECIFICATION

The roof shall be an ATP Roof, 3-ply over poured concrete, applied according to "Specifications for ATP Roofs."

(Where bond is required, add this sentence.)

An ATP 10-Year Guarantee Bond shall be furnished by the roofing contractor.

Note: The above specifications are printed in book form by the AMERICAN TAR PRODUCTS COMPANY, and if there is not a copy in your file, A.I.A. 12b11, one will be mailed free, upon request.

ATP Waterproofing

Waterproofing may be classified into (a) Membrane waterproofing; (b) Non-membrane Waterproofing; (c) Integral Waterproofing.

Membrane waterproofing is for surfaces which will be so protected that the membrane will not be punctured. ATP Membrane waterproofing consists of alternate layers of ATP Approved Tarred Felt and ATP Old Style Pitch. Specifications on request. Integral waterproofing does not come within the scope of this discussion. Non-membrane waterproofing consists of the application of various substances to the surface to be waterproofed, and ATP Dampproofing Paint and ATP High-Penetration Waterproofing come in this classification.

ATP High-Penetration Waterproofing is a low cost, deep-penetration method of waterproofing. Specifications on request.

THE BARRETT COMPANY

Manufacturers of Roofing Materials

FAIRFIELD, ALA. CHICAGO, ILL. NEW YORK, N. Y. MINNEAPOLIS, MINN.
BOSTON, MASS. SALT LAKE CITY, UTAH KANSAS CITY, MO. PHILADELPHIA, PA.

THE BARRETT COMPANY, LIMITED, MONTREAL, QUE.

Products

ROOFING MATERIALS:

For flat surfaces: BARRETT SPECIFICATION PITCH and BARRETT SPECIFICATION FELT; BLACK DIAMOND PITCH and BLACK DIAMOND FELT. For detailed specifications see Volume I, Barrett Architects' and Engineers' Built-Up Roofing Reference Series.

For steep surfaces: BARRETT SPECIFICATION FELT, BARRETT SPECIFICATION PITCH, ANCHOR ASPHALT, and S. I. S. ROOFING. For detailed specifications see Volume II, Barrett Architects' and Engineers' Built-Up Roofing Reference Series.

Waterproofing:

For foundations, reservoirs, swimming pools, subways, tunnels, floors, etc., special specifications submitted.

Insulating and Building Papers:

For sheathing, lining, etc.

Dampproofing and Preservative Paints, Wood Preservatives, Flooring.

For Flashings for Brick and Concrete Walls, see page A550, also Volume III, Barrett Architects' and Engineers' Built-Up Roofing Reference Series; for Roof Leader and Roof-Vent Connections, see page C2769, also Volume IV, Barrett Architects' and Engineers' Built-Up Roofing Reference Series.

The Barrett Specification Roof

A roof that is guaranteed by a twenty-year or ten-year surety bond, as desired.

A roof that passes the most rigid inspection.

A roof that is scientifically and mechanically correct in every detail.

A roof that contains more than twice as much actual waterproofing material as is generally used in other built-up roofing.

A roof that has a wearing surface which resists all sorts of abuse and the most severe weather conditions.

A roof that is fire retardant; it carries Class "A" rating by the Underwriters' Laboratories, Inc.

A roof that takes the base-rate of fire insurance.

A roof that needs no repairs or paint.

A roof that costs less per year of service than any other roofing suitable for flat surfaces.

The Guaranty Bond

A 20-year Guaranty Bond is offered on Barrett Specification Type "AA" Roofs and a 10-year Guaranty Bond on Barrett Specification Type "A" Roofs by THE BARRETT COMPANY without charge in accordance with Note 1 of The Barrett Specifications hereinafter printed. Guarantees and bonds do not keep out water, but The Barrett Guaranty Bond differs from every other roofing guarantee or bond, in that this Company does not apply the roof and has no contractor's profit as a motive for cheapening the roofing. When applied by experienced and reliable roofing contractors, and carefully inspected by competent inspectors, Barrett Specification Roofs applied in accordance with the specifications are just as economical and serviceable without the bond as with it.

The Barrett Company TRADE-MARK

Barrett Specification Roofs TRADE-MARK

THE BARRETT COMPANY has prepared an inspection manual, known as "Requirements Covering Application and Inspection of Barrett Specification Roofs," for use by architects, engineers, and owners where the Company's inspection service is not available.

The Barrett Specification, Type "AA" Roof—for Use over Board Sheathing—5 Plies

Bonded for 20 years.

See Note 1.

Incline—This Specification shall not be used where the roof incline exceeds two (2) inches to one (1) foot.

Roof-deck—The roof-deck shall be of seasoned lumber, smooth and free from loose boards, large cracks or knotholes, and free from loose material. If roof-deck is inclined, it shall be properly graded to outlets.

Roofing—*First*—Lay one (1) thickness of sheathing paper or unsaturated felt, weighing not less than five (5) pounds per one hundred (100) square feet, lapping the sheets at least one (1) inch.

Second—Over entire surface lay two (2) plies of Specification Tarred Felt, lapping each sheet seventeen (17) inches over preceding one, and nail as often as is necessary to hold in place until remaining felt is laid.

Third—Coat the entire surface uniformly with Specification Pitch.

Fourth—Over the entire surface lay three (3) plies of Specification Tarred Felt, lapping each sheet twenty-two (22) inches over preceding one, mopping with Specification Pitch the full twenty-two (22) inches on each sheet, so that in no place shall felt touch felt.

Such nailing as is necessary shall be done so that all nails will be covered by not less than two (2) plies of felt.

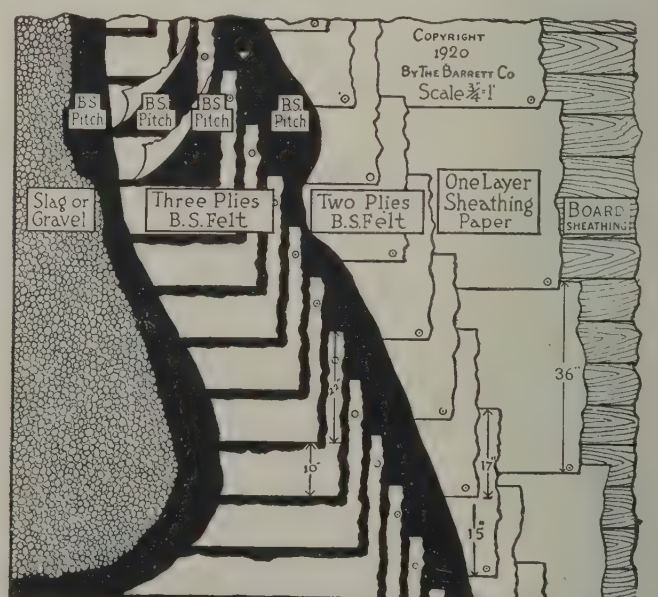

Diagram Showing Barrett Specification, Type "AA" Roof Over Boards
Bonded for 20 years

Continued on next page

Fifth—Over the entire surface pour from a dipper a uniform coating of Specification Pitch into which, while hot, embed not less than four hundred (400) pounds of gravel or three hundred (300) pounds of slag for each one hundred (100) square feet. The gravel or slag shall be from one-quarter (¼) to five-eighths (⅝) inch in size, dry and free from dirt.

General—The felt shall be laid without wrinkles or buckles. Not less than one hundred and fifty (150) pounds of Specification Pitch shall be used for constructing each one hundred (100) square feet of completed roof, and the pitch shall not be heated above 400° Fahr.

The roof shall be applied by a roofing contractor approved by The Barrett Company. He shall furnish The Barrett Company's Surety Bond Guaranty issued by the U. S. Fidelity & Guaranty Co., of Baltimore, covering a period of twenty (20) years from date of completion, in accordance with Note No. 1.

20-year Guaranty Bond—*Note No. 1*—The Barrett Company will give its 20-year Guaranty Bond on all jobs of 5000 sq. ft. or more, in the United States and Canada, where its Inspection Service is available, providing the roof is laid by a roofing contractor approved by The Barrett Company, in strict accordance with the above Specification and subject to Barrett inspection and approval.

Condensed Specification—*Roofing*—Shall be a Barrett Specification Roof, Type "AA," laid in accordance with The Barrett Specification (for use over Board Sheathing) by a roofing contractor approved by The Barrett Company. The roofing contractor shall furnish The Barrett Company's Surety Bond Guaranty for twenty (20) years, in accordance with Note No. 1 of said Specification.

The Barrett Specification, Type "AA" Roof—for Use over Concrete—4 Plies

Bonded for 20 years.

See Note 1.

Incline—This Specification shall not be used where the roof incline exceeds one (1) inch to one (1) foot.

Roof-deck—The roof-deck shall be smooth, firm, dry, and free from loose material. If roof-deck is inclined, it shall be properly graded to outlets.

Roofing—*First*—Coat the concrete uniformly with Specification Pitch.

Second—Over the entire surface lay four (4) plies of Specification Tarred Felt, lapping each sheet twenty-four and one-half (24½) inches over preceding one, mopping with Specification Pitch the full twenty-four and one-half (24½) inches on each sheet, so that in no place shall felt touch felt.

Third—Over the entire surface pour from a dipper a uniform coating of Specification Pitch, into which, while hot, embed not less than four hundred (400) pounds of gravel or three hundred (300) pounds of slag for each one hundred (100) square feet. The gravel or slag shall be from one-quarter (¼) to five-eighths (⅝) inch in size, dry, and free from dirt.

General—The felt shall be laid without wrinkles or buckles. Not less than two hundred (200) pounds of pitch shall be used for constructing each one hundred (100) square feet of completed roof, and the pitch shall not be heated above 400° Fahr.

The roof shall be applied by a roofing contractor approved by The Barrett Company. He shall furnish The Barrett Company's Surety Bond Guaranty issued by the U. S. Fidelity & Guaranty Company, of Baltimore, covering a period of twenty (20) years from date of completion, in accordance with Note No. 1.

20-year Guaranty Bond—*Note No. 1*—The Barrett Company will give its 20-year Guaranty Bond on all jobs of 5000 sq. ft. or more, in the United States and Canada, where its Inspection Service is available, providing the roof is laid by a roofing contractor approved by The Barrett Company, in strict accordance with the above Specification and subject to Barrett inspection and approval.

Condensed Specification—*Roofing*—Shall be a Barrett Specification Roof, Type "AA," laid in accordance with The Barrett Specification (for use over Concrete) by a roofing contractor approved by The Barrett Company. The roofing contractor shall furnish The Barrett Company's Surety Bond Guaranty for twenty (20) years, in accordance with Note No. 1 of said Specification.

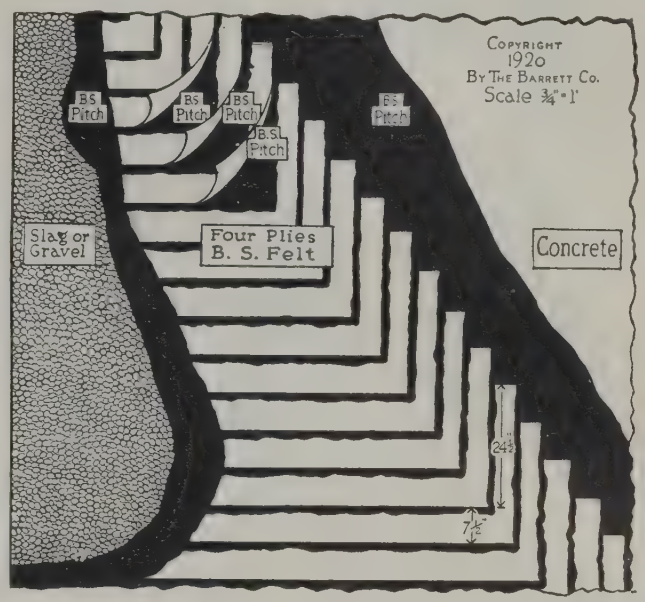

Diagram Showing Barrett Specification, Type "AA" Roof Over Concrete
Bonded for 20 years

The Barrett Specification, Type "A" Roof—for Use over Board Sheathing—4 Plies

Bonded for 10 years.

See Note 1.

Incline—This Specification shall not be used where the roof incline exceeds two (2) inches to one (1) foot.

Roof-deck—The roof-deck shall be of seasoned lumber, smooth and free from loose boards, large cracks or knotholes, and free from loose material. If roof-deck is inclined, it shall be properly graded to outlets.

Roofing—*First*—Lay one (1) thickness of sheathing paper or unsaturated felt, weighing not less than five (5) pounds per one hundred (100) square feet, lapping the sheets at least one (1) inch.

Second—Over the entire surface lay two (2) plies of Specification Tarred Felt, lapping each sheet seventeen (17) inches over preceding one, and nail as often as is necessary to hold in place until remaining felt is laid.

Third—Coat the entire surface uniformly with Specification Pitch.

Fourth—Over the entire surface lay two (2) plies of Specification Tarred Felt, lapping each sheet seventeen (17) inches over preceding one, mopping with Specification Pitch the full seventeen (17) inches on each sheet so that in no place shall felt touch felt. Such nailing as is necessary shall be done so that all nails will be covered by not less than one (1) ply of felt.

Fifth—Over the entire surface pour from a dipper a uniform coating of Specification Pitch, into which, while hot, embed not less than four hundred (400) pounds of gravel or three hundred (300) pounds of slag for each one hundred (100) square feet. The gravel or slag shall be from one-quarter (¼) to five-eighths (⅝) inch in size, dry and free from dirt.

Continued on next page

General—The felt shall be laid without wrinkles or buckles. Not less than one hundred and twenty-five (125) pounds of pitch shall be used for constructing each one hundred (100) square feet of completed roof, and the pitch shall not be heated above 400° Fahr.

The roof shall be applied by a roofing contractor approved by THE BARRETT COMPANY. He shall furnish THE BARRETT COMPANY'S Surety Bond Guaranty issued by the U. S. Fidelity & Guaranty Company, of Baltimore, covering a period of ten (10) years from date of completion, in accordance with Note No. 1.

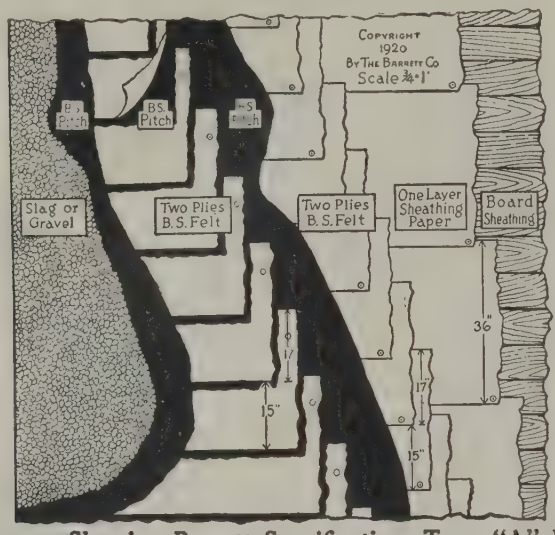

Diagram Showing Barrett Specification, Type "A" Roof Over Boards
Bonded for 10 years

10-year Guaranty—*Note No. 1*—THE BARRETT COMPANY will give its 10-year Guaranty Bond on all jobs of 5000 sq. ft. or more, in the United States and Canada, where its Inspection Service is available, providing the roof is laid by a roofing contractor approved by THE BARRETT COMPANY, in strict accordance with the above Specification and subject to Barrett inspection and approval.

Condensed Specification—*Roofing*—Shall be a Barrett Specification Roof, Type "A," laid in accordance with The Barrett Specification (for use over Board Sheathing) by a roofing contractor approved by THE BARRETT COMPANY. The roofing contractor shall furnish THE BARRETT COMPANY'S Surety Bond Guaranty for ten (10) years, in accordance with Note No. 1 of said Specification.

The Barrett Specification, Type "A" Roof—for Use over Concrete—3 Plies

Bonded for 10 years.

See Note 1.

Incline—This Specification shall not be used where the roof incline exceeds one (1) inch to one (1) foot.

Roof-deck—The roof-deck shall be smooth, firm, dry, and free from loose material. If roof-deck is inclined, it shall be properly graded to outlets.

Roofing—*First*—Coat the concrete uniformly with Specification Pitch.

Second—Over the entire surface lay three (3) plies of Specification Tarred Felt, lapping each sheet twenty-two (22) inches over preceding one, mopping with Specification Pitch the full twenty-two (22) inches on each sheet so that in no place shall felt touch felt.

Third—Over the entire surface pour from a dipper a uniform coating of Specification Pitch, into which, while hot, embed not less than four hundred (400) pounds of gravel or three hundred (300) pounds of slag for each one hundred (100) square feet. The gravel or slag shall be from one-quarter (¼) inch to five-eighths (⅝) inch in size, dry, and free from dirt.

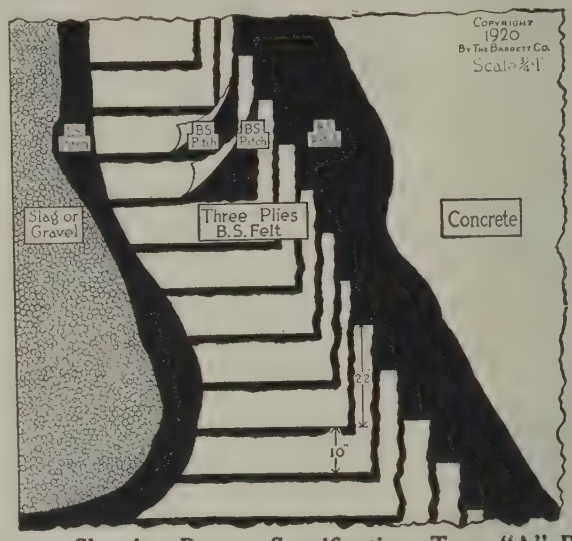

Diagram Showing Barrett Specification, Type "A" Roof Over Concrete
Bonded for 10 years

General—The felt shall be laid without wrinkles or buckles. Not less than one hundred and seventy-five (175) pounds of pitch shall be used for constructing each one hundred (100) square feet of completed roof, and the pitch shall not be heated above 400° Fahr.

The roof shall be applied by a roofing contractor approved by THE BARRETT COMPANY. He shall furnish THE BARRETT COMPANY'S Surety Bond Guaranty issued by the U. S. Fidelity & Guaranty Company, of Baltimore, covering a period of ten (10) years from date of completion, in accordance with Note No. 1.

10-year Guaranty Bond—*Note No. 1*—THE BARRETT COMPANY will give its 10-year Guaranty Bond on all jobs of 5000 sq. ft. or more, in the United States and Canada, where its Inspection Service is available, providing the roof is laid by a roofing contractor approved by THE BARRETT COMPANY, in strict accordance with the above Specification and subject to Barrett inspection and approval.

Condensed Specification—*Roofing*—Shall be a Barrett Specification Roof, Type "A," laid in accordance with The Barrett Specification (for use over Concrete) by a roofing contractor approved by THE BARRETT COMPANY. The roofing contractor shall furnish THE BARRETT COMPANY'S SURETY Bond Guaranty for ten (10) years, in accordance with Note No. 1 of said Specification.

Roofing for Steep Surfaces

Barrett built-up steep roofing specifications for sawtooth, monitor, umbrella, butterfly, hopper, plain hip, and other types of steep roof construction. Bonded for 10 years when applied in accordance with Note No. 1 in Volume II, Architects' and Engineers' Built-up Roofing Reference Series.

For Thick Butt Shingles, see page A484; for Anaconda Copperclad Shingles, see page A506.

TRADE-MARK

Rexalt Constructed Roofs

Rexalt Constructed Roofs are built-up roofs of the highest type. In them are combined high quality materials in the proper proportions to insure long years of hard service under the most severe climatic conditions.

These roofs are suitable for use over concrete, gypsum or wood decks of flat, steep or sawtooth construction.

Specification Data

General

The felt in every case shall be Flintkote Certified Felt—Rexalt Saturated, either 15 or 30 lb. per 100 sq. ft., as indicated below.

The membrane shall be Rexalt Compound, brought to the job in the manufacturers' original container and should be heated to a temperature of not more than 375° F.

A thermometer must be used as all bituminous materials are easily destroyed by overheating.

On concrete or gypsum decks Flintkote Concrete Primer shall be used.

If desired, Rex Flintkote Cap Sheet may be used as an additional layer.

Rexalt Constructed Roofs Over Board Decks—Bills of Material Per Square

Medium Grade

2 layers Rexalt Compound (6 gal.)
1 layer 30-lb. Felt (½ roll—108 sq. ft.)
1 layer 15-lb. Felt (¼ roll—108 sq. ft.)

Standard Grade

3 layers Rexalt Compound (9 gal.)
1 layer 30-lb. Felt (½ roll—108 sq. ft.)
2 layers 15-lb. Felt (½ roll—216 sq. ft.)

Super Grade

4 layers Rexalt Compound (12 gal.)
5 layers 15-lb. Felt (1¼ rolls—540 sq. ft.)

Methods of Construction

The deck must be swept clean and free of all debris. Felt should be unwound and laid opposite to the roll. Each successive layer of felt and the entire final surface is to be mopped with a uniform coating of Rexalt Compound.

Fire walls and parapet walls are to be mopped with a heavy coat of hot Rexalt Compound.

Medium Grade

(1) Cover entire surface with one layer of 30-lb. felt lapped 2 in. and securely nailed at the lap every 6 in.

(2) Cover entire surface with Rexalt Compound using approximately 3 gallons per 100 sq. ft.

(3) Embed in the hot Rexalt Compound one layer of 15-lb. felt, lapping not less than 2 in.

(4) Cover entire surface with final coating of Rexalt Compound.

Standard Grade

(1) Cover entire surface with one layer of 30-lb. felt lapped 2 in. and securely nailed at the lap every 6 in.

(2) Cover entire surface with Rexalt Compound using approximately 3 gallons per 100 sq. ft.

(3) Embed in the hot Rexalt Compound two layers of 15-lb. felt, lapping each layer 19 in. over the preceding layer, mopping between the layers a heavy coating of Rexalt Compound.

(4) Cover entire surface with final coating of Rexalt Compound.

Super Grade

(1) Cover entire surface with two layers of felt lapping 19 in. and nailing at the lap every 12 in.

(2) Cover these layers of felt with Rexalt Compound.

(3) Embed in the hot Rexalt Compound three layers of felt, lapping each layer 24 in. over the preceding layer, mopping between the layers a heavy coating of Rexalt Compound.

(4) Cover entire surface with final coating of Rexalt Compound.

Rexalt Constructed Roofs Over Concrete or Gypsum Decks—Bills of Material Per Square

Method of construction of these roofs is identical with that of roofs over board decks except that concrete primer and one coating of Rexalt Compound are applied before the first layer of felt, and that instead of the laps being nailed they are sealed with Rexalt Compound.

Medium Grade

1 layer Concrete Primer (1 gal.) and
1 layer Rexalt Compound (3 gal.)
in addition to materials for use over board decks.

Standard Grade

1 layer Concrete Primer (1 gal.) and
1 layer Rexalt Compound (3 gal.)
in addition to materials for use over board decks.

Super Grade

1 layer Concrete Primer (1 gal.) and
2 layers Rexalt Compound (6 gal.)
in addition to materials for use over board decks.

Experience and Facilities

Established in 1873, THE PHILIP CAREY COMPANY has furnished millions of squares of roofing, distributed and applied to buildings of every description throughout the world.

The Carey mills are modern, and facilities for handling large business are maintained at a high standard.

Advantages of Carey Built-up Roofs

It is important that architects, builders, engineers and owners know the following advantages of Carey built-up roofs.

(1) They are pliable and are readily adjusted around skylights, chimneys, ventilators, manholes, flashing and all roof irregularities.

(2) They are easy to apply, and are light enough in weight to avoid the necessity of heavy rafter construction.

(3) They are smooth surfaced—requiring no coating of slag.

(4) They can be adapted to any type of roof—flat or steep surface—over wood, tile, concrete, gypsum or steel.

(5) About 85% of the weight consists of genuine asphalt.

(6) They have proved their worth over long years on many of the finest buildings of the country—banks, theaters, industrial buildings, office buildings, apartments, schools, hospitals, department stores, factories, etc.

(7) Carey built-up roofs are built up on the building layer by layer. The materials consist of Carey Fiberock—single sheets of asphalt—impregnated asbestos felt; Feltex—asphalt saturated rag felt; and Carey Manco Asphalt. These materials are manufactured in Carey's own mills, under the supervision of Carey experts.

(8) Asphalt is used exclusively instead of coal tar pitch because it is far superior in its cohesive and binding properties, its enduring flexibility, waterproofing qualities and resistance to temperature changes.

(9) The Carey Branch and Distributor organization covers the country, and the men who apply Carey built-up roofs have back of them fifty years' experience in the manufacture of roofing materials and their application to buildings. They are thoroughly trained in all branches of roofing work, and every roof that they apply is fully guaranteed.

(10) Carey built-up roofs comply with the standards of the Underwriter's Laboratories and are so labeled.

Construction of Carey Asbestos Built-up Roofing

Carey Roofing Materials

Carey felts consist of the best grade of stock, carefully prepared and saturated in asphalt to insure absolute waterproofing protection and permanent flexibility.

Fiberock (Asbestos Asphalt Impregnated Felt)—Used in Carey built-up roof specifications, also for waterproofing and weatherproofing work.

Put up in rolls containing 324 sq. ft.; width 36 in.; weight about 45 lb. per roll.

Feltex (Asphalt Saturated Felt)—Used in Carey built-up roofs, waterproofing and weatherproofing work.

Furnished in rolls containing 432 sq. ft.; width, 36 in.; weight, about 60 lb. per roll.

Manco (Carey Asphalt)—More than forty years' experience in asphalt refining is back of Carey Manco. For roofing purposes no other asphalt has so far equaled its splendid qualities.

Manco is prepared with a high melting point, offering the greatest resistance to high and low temperatures.

Its flexible quality also offers all necessary protection when exposed to ordinary expansion and contraction.

If interested in high grade asphalt, write to this company stating requirements.

Correspondence

Information and advice respecting the adaptability of Carey Roof Specifications to meet any particular requirement, will be furnished on request.

Write for samples and further information.

Selecting the Right Roof

It is highly important, from the standpoint of durability and service, that the architect when preparing his roofing specifications should select materials of lasting quality and insist that laying instructions be strictly followed.

Continued on next page

Before a specification is recommended, information in answer to the following questions must be ascertained: What is the roof surface going to be—concrete, tile, gypsum block or wood sheathing, Is it to be a steep or flat roof? What kind of flashing is to be used? What temperature and atmospheric conditions must the roof withstand? Will it be subjected to fumes, steam, foot or mechanical wear of any kind, sparks, etc.?

With these facts at hand the most dependable type of roof can be selected, and the Carey Built-up Roof Specifications on the following pages will meet practically every condition encountered by the architect.

Key to Carey Built-up Specifications

Underwriters' Laboratory Classification

Over Concrete

Carey Asbestos Built-up Roof Specification 4-ply, for general class of mill and factory construction, surfaces flat or inclined.

Carey Asbestos Built-up Specifications No. 15A designed for use on both flat and steep surfaces, roofing for general type of mill and factory construction.

Carey Built-up Specification No. 15AAA for flat and steep surfaces, extra heavy type of construction for mills, factories, railroad roundhouses, boiler plants, etc.

Carey Built-up Specification No. 18 consisting of nine courses asphalt and rag felt, a roof that will offer maximum protection to the building.

Carey Built-up Roof Specification No. 8 asphalt saturated felt construction for general factory and mill purposes.

Over Wood

Carey Built-up Roof Specification No. 5, asphalt saturated felt construction for flat and steep surfaces, factory and mill constructions, low cost.

Carey Built-up Roof Specification No. 7, asphalt saturated felt roof for flat and steep surfaces, saw tooth, mill and factory construction general use.

Carey Built-up Roof Specification No. 14, asphalt saturated felt construction, flat and steep surfaces, greatest durability and protection for mills, factories, store rooms, business blocks and schools.

Carey Built-up Roof Specification No. 15, flat and steep surfaces, general type of mill and factory construction.

Carey Asbestos Built-up Roof Specification No. 15AA heavy type of asbestos construction for general mill and factory purposes, flat and steep surfaces.

Carey Built-up Roofing Specifications for Various Types of Roofing and Subbases

(For Flashing Details and Specifications See Sixth Page Following)

Specification No. 5

Feltex Built-up Roofing Over Wood Subbase

Note: The following paragraphs under the heading "General" should be inserted at the head of each of the following specifications selected, deleting any paragraph that does not apply to existing conditions.

General—Roof surface is to be prepared and made ready for us for the application of roofing with dry seasoned sheathing boards of uniform thickness, closely laid. All sheathing boards must be surface nailed with at least two nails to each purlin or rafter in addition to blind nailing.

General contractor is to remove or hammer down all projecting nail heads, cover all knot holes and fill in all open places between sheathing boards before the roofing contractor commences the application of the roofing.

Ends of all sheathing boards must terminate on solid rafter or purlin and be securely nailed thereto.

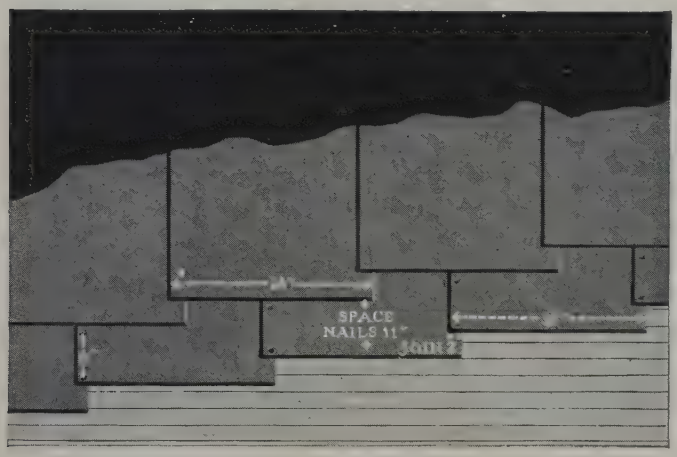
The roof surface shall be swept clean of all chips, nails, rubbish, etc.

General contractor to install cant strips and suitable nailing strips in the wall for flashing. Counterflash all walls with No. 24 or No. 26 gauge galvanized iron, or if preferred, copper may be used. Counterflashing to be firmly attached in the wall with suitable plugs and portland cement.

If counterflashing is furnished by the roofing contractor, both material and labor of installation shall be charged to the acceptor of the proposal as an extra, unless otherwise specifically stated in the proposal.

Work Proposed—This specification contemplates furnishing all materials and labor required to properly apply the roofing and base flashing and line the gutters. (No metal work of any kind is included.)

Sheathing must be dry before applying the roofing.



Application of Carey Feltex Built-up Roof Over Wood Subbase. Specification No. 5

Materials—The materials used in the construction of this roof shall be as follows:

	Lb. per square
(a) Carey Feltex (weight 30 lb. per sq.)	30
(b) Carey Manco Asphalt	25
(c) Carey Feltex (weight 15 lb. per sq.)	15
(d) Carey Manco Asphalt	25
(e) Nails ⅞ in.	1

Weight per square, when applied, to be approximately 96 lb.

Application—The roof surface shall be covered with 1 sheet of Carey Feltex, 36 in. wide, weighing about 30 lb. per square. Lap the sheets not less than 2 in. then nail the sheets at the joints with ⅞ in. nails and flat tin caps on 6 in. centers with one additional row of nails and caps spaced 11 in. apart, lengthwise through the center of the sheet. After the 30 lb. Feltex sheet has been completed in accordance with above instructions, proceed to cover the same with 1 layer of Carey Feltex, 36 in. wide and weighing about 15 lb. per square. The 15-lb. sheet to be cemented with Manco Asphalt securely to the 30-lb. sheet, lapping the top sheets not less than 2 in. between the joints of the lower sheet—no nails to be used through the top sheet.

Base sheets shall be laid crosswise of the sheathing boards. The top sheets may be laid crosswise or with the bottom sheets as best suits the type of roof construction.

Gutters—Line all gutters in the same manner as described under "Application."

In certain types of construction it is desirable that all gutters and valleys should be reenforced with an extra sheet of felt, weighing not less than 15 lb. per square, well mopped in with Manco Asphalt. (If this extra reenforcement is required, it is to be charged for as an extra on a time and material basis.)

Note: All concrete or brick walls to be flashed should be primed to full height of flashing.

Flashing—The general contractor or owner to provide suitable nailing strips in the walls at time of construction—usual size 2 x 4 in., also provide cant strips for bridging angle of wall and roof deck.

Note: Height of flashing, width of cant strips and flashing materials may be regulated to suit height of wall and other conditions prevailing.

Counterflashing—See "General" and refer to details on last page of this catalogue.

Roof Finish—The entire surface of the roof applied shall be mopped with Manco Asphalt, applied hot, and spread to a uniform finish.

Continued on next page

Specification No. 7

Feltex Built-up Roofing Over Wood Subbase

General—(Insert paragraph under heading "General," Specification No. 5.)

Work Proposed—This specification contemplates furnishing all materials and labor required to properly apply the roofing and base flashing, and line the gutters. (No metal work of any kind is included.) Sheathing must be dry before applying the roofing.

Materials—The materials used in the construction of this roof shall be as follows:

	Lb. per square
(a) Carey Feltex (weight 30 lb. per sq.)	30
(b) Carey Manco Asphalt	25
(c) Carey Feltex (weight 15 lb. per sq.)	15
(d) Carey Manco Asphalt	25
(e) Carey Feltex (weight 15 lb. per sq.)	15
(f) Carey Manco Asphalt	25
(g) Nails ⅞ in., caps 1 in., ¾ lb.	1¾

Weight per square, when applied, to be approximately 137 lb.

Application—The roof surface shall be covered with sheets of Carey Feltex, 36 in. wide, weighing about 30 lb. per square. Lap the sheets not less than 2 in. then nailing the sheets at the join with ⅞-in. nails and caps on 6-in. centers, with one additional row of nails and caps spaced 11 in. apart lengthwise through the center of sheet.

After the 30-lb. Feltex Sheets have been completed in accordance with the above instructions, proceed to cover the same with 2 layers of Carey Feltex, weight about 15 lb. per square each, cementing solid between sheets and joining same to the 30-lb. sheet, so that at no place shall felt touch felt, each sheet to overlap the previous sheet so that 17 in. are left exposed, making a continuous 2-ply built-up over the 30-lb. base Feltex sheet—no nails to be used through the top sheets.

Base sheets shall be laid crosswise of the sheathing boards. The top sheets may be laid crosswise or with the bottom sheets as best suits the type of roof construction.

Valleys and Gutters—Line all valleys and gutters in the same manner as described under "Application."

In certain types of construction it is desirable that all gutters and valleys should be reenforced with an extra sheet of felt, weighing not less than 15 lb. per square, well mopped in with Manco Asphalt. If this extra reenforcement is required it is to be charged for as an extra on a time and material basis.

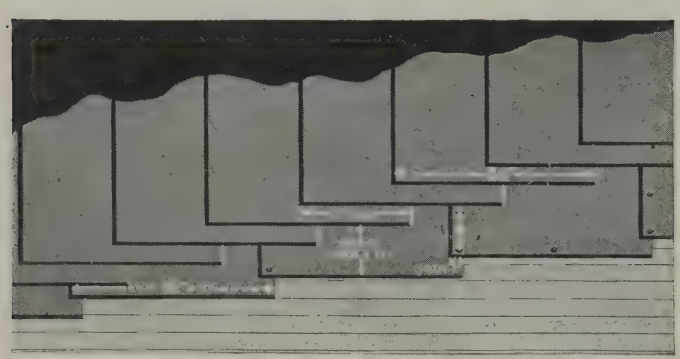
Note: All concrete or brick walls to be flashed should be primed to full height of flashing.

Flashing—The general contractor or owner to provide suitable nailing strips in the walls at time of construction—usual size about 2x4 in., also provide cant strips for bridging angle of wall and roof deck. See flashing details on last page of this catalogue.

Note: Height of flashing, width of cant strips and flashing materials may be regulated to suit height of wall and other conditions prevailing.

Counterflashing—See "General," Specification No. 5.

Roof Finish—The entire surface of the roof applied shall be mopped with Manco Asphalt, applied hot and spread to a uniform finish.



Application of Carey Feltex Built-up Roof Over Wood Subbase. Specification No. 7

Specification No. 8

Feltex Built-up Roofing Over Concrete or Gypsum

General—All concrete and other surfaces shall be prepared for us for the application of roofing, with a comparatively smooth, hard finish, free from holes and loose particles of sand and cement, and the expense of rectifying any extensive irregularities, such as depressions in the plane of the roof surface, which must be filled, shall be chargeable to the acceptor of this proposal.

All sharp angles to be rounded out so as to avoid rough or sharp edges. On steep surfaces, provision shall be made for anchoring the roofing sheets, the anchor strip to consist of a wood strip embedded into the concrete surface at the ridge.

All down-spout openings must be lower than the roof surface and the gutters and surface properly graded by the cement contractor.

Counterflash all walls with No. 26 gauge galvanized iron, or, if preferred, copper may be used. Counterflashing to be firmly attached in wall with suitable plugs and portland cement. Also see details for Carey Fiberock Asbestos counterflash. If furnished by the roofing contractor, both materials and labor of installation shall be charged to the acceptor of this proposal as an extra, unless otherwise specifically stated in proposal.

General contractor to provide an opening in walls for inserting of counterflashing, approximately 1½ in. deep and ½ in. wide. The concrete surface must be thoroughly dry and swept clean before the roofing is applied.

Work Proposed—This specification contemplates furnishing all material and labor required to apply the roofing and base flashing and line the gutters. (No metal work of any kind is included.)

Materials—The materials used in the construction of this roof shall be as follows:

	Lb. per square
(a) Carey Asphalt Primer, (1 gal.)	9
(b) Carey Manco Asphalt	50
(c) Carey Feltex Felt	15
(d) Carey Manco Asphalt	25
(e) Carey Feltex Felt	15
(f) Carey Manco Asphalt	25
(g) Carey Feltex Felt	15
(h) Carey Manco Asphalt	25

Weight per square, when applied, to be approximately 179 lb.

Application—The concrete shall be coated with Carey Asphalt Primer, applied cold, and thoroughly brushed in. The surface shall be mopped with Carey Manco Asphalt, into which, while hot, embed 3 layers of Carey Feltex (Asphalt-saturated Felt), cementing solid between the sheets so that at no place shall felt touch felt; each sheet to overlap the previous sheet so that 11 in. are left exposed, making 8 courses, asphalt, felt and primer.

Gutters—Apply 3 layers of Carey Feltex Felt lengthwise with the gutter. Each sheet to overlap the previous sheet so that ⅓ of its length is left exposed. (Use sheets cut to uniform length.)

All gutter sheets shall extend on the roof surface sufficiently to be properly lapped with the main roofing sheets and are to be applied as specified under "Application."

Note: All concrete or brick walls to be flashed should be primed to full height of flashing with Carey Asphalt Primer.

Flashing—Cement strip of Feltex 6 in. wide in angle of wall, 3 in. to wall and 3 in. to flat deck. The Feltex sheets from main roof to be cut so they will extend up on all fire walls, skylights and other vertical surfaces to a height of 6 in.; this extension to be cemented to vertical surface. A cap sheet of Feltex cut 12 in. wide to be cemented in 6 in. to wall and 6 in. to flat deck.

General Contractor to leave opening in the walls for inserting counterflash. See flashing details on last page of this catalogue.

Counterflashing—See "General."

Roof Finish—The entire surface of the roofing applied shall be mopped with Carey Manco Asphalt, applied hot and evenly spread to a uniform finish.

Application of Carey Feltex Built-up Roofing Over Concrete or Gypsum. Specification No. 8

Specification No. 14

Carey Feltex Built-up Roofing Over Wood Subbase

General—(Insert paragraph under heading "General," Specification No. 5).

Work Proposed—This specification contemplates furnishing all materials and labor required to properly apply the roofing and base flashing and line the gutters.

No metal work of any kind is included. Sheathing must be dry before applying roofing.

Continued on next page

Materials—Materials used in the construction of this roof shall be as follows:

	Lb. per square
(a) Carey Feltex (weight 30 lb.)	30
(b) Carey Manco Asphalt	25
(c) Carey Feltex (weight 15 lb.)	15
(d) Carey Manco Asphalt	25
(e) Carey Feltex (weight 15 lb)	15
(f) Carey Manco Asphalt	25
(g) Carey Feltex (weight 15 lb.)	15
(h) Carey Manco Asphalt	25
(j) Nails ⅞ in. (wt. 1 lb.)	1
(k) Caps 1 in. Flat	¾ lb.

Weight per square when applied to be approximately 176 lb.

Application—The roof surface shall be covered with sheets of Carey Feltex 36 in. wide weighing about 30 lb. per square. Lap the sheets not less than 2 in., then nailing the sheets at the join with ⅞ in. nails and caps on 6 in. centers with one additional row of nails spaced 11 in. apart lengthwise through center of sheet.

After the 30 lb. Feltex sheets have been completed in accordance with the above instructions, proceed to cover the same with 3 layers of Feltex, weight about 15 lb. per square each, cementing solid between sheets and bonding same to the 30 lb. sheet, so at no place shall felt touch felt, each sheet to overlap the previous sheet, so that 11 in. are left exposed, making a continuous 3-ply Built-up over the 30 lb. base Feltex sheet. On steep surfaces nail top sheets at upper edge.

Base sheets shall be laid crosswise of the sheathing boards. The top sheets may be laid crosswise or with the bottom sheets as best suits the type of roof construction.

Valleys and Gutters—Line all valleys and gutters in the same manner as described under "Application."

In certain types of construction it is desirable that all gutters and valleys should be reenforced with an extra sheet of felt, weighing not less than 15 lb. per square, well mopped in with Manco Asphalt. (If this extra reenforcement is required it is to be charged for as an extra on a time and material basis.)

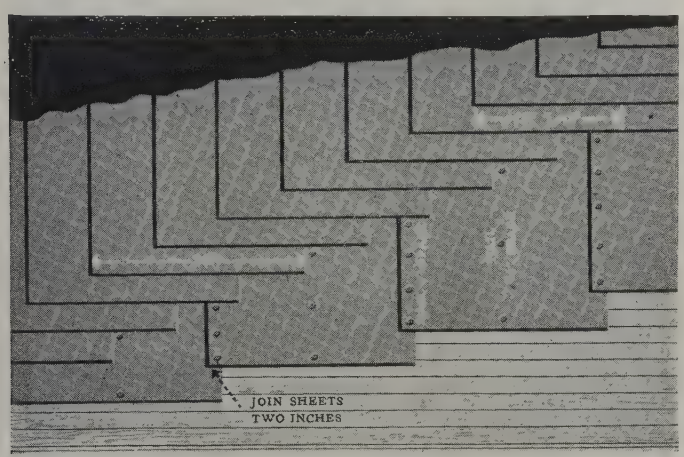
Note: All concrete or brick walls to be flashed should be primed to full height of flashing.

Flashing—The general contractor or owner to provide suitable nailing strips in the walls at time of construction, usual size about 2x4 in., also provide cant strips for bridging angle of wall and roof deck. See flashing details on last page of this catalogue.

Note: Height of flashing, width of cant strips and flashing materials may be regulated to suit height of wall and other conditions prevailing.

Counterflashing—See "General," Specification No. 5.

Roof Finish—The entire surface of the roof applied shall be mopped with Manco Asphalt, applied hot and spread to a uniform finish.



Application of Carey Feltex Built-up Roofing Over Wood Subbase. Specification No. 14

Specification No. 15

Carey Asbestos Built-up Roofing for Application Over Wood Subbase

General—(Insert paragraph under heading "General," Specification No. 5.)

Work Proposed—This specification contemplates furnishing all materials and labor required to apply the roofing and base flashing, and line the gutters. (No metal work of any kind is included.) Sheathing must be dry before applying the roofing.

Materials—The materials for each square used in the construction of this roof shall be as follows:

One roll (110 sq. ft.) Carey Asbestos Asphalt Impregnated Roofing Felt, weight approximately 60 lb.

Two sheets (weight 15 lb. per sq. ea.) Carey Fiberock (Asbestos Impregnated Felt).

80 lb. Carey Manco Asphalt.

Nails and flat tin caps.

Weight per square, when applied, to be approximately 171 lb.

Application—The roof surface shall be covered with Carey Asbestos Asphalt Impregnated Roofing, lapping the sheets so that there will be a lap of not less than 3 in., cementing between the laps with Manco Asphalt, and secure with nails and caps, spacing the nails along the lap 4 in., also secure through the center of sheets with 2 rows of nails and flat tin caps staggered, spacing nails crosswise of sheet 11 in., and lengthwise of sheet 15 in. This surface to be mopped with Carey Manco Asphalt into which while hot shall be laid 2 layers of 1-ply Fiberock (Asphalt Impregnated Asbestos Felt), cementing solid between sheets, so that at no place shall felt touch felt, each sheet to overlap the previous sheet, leaving 17 in. exposed. All sheets shall be laid crosswise of the sheathing boards and so lapped that at no place shall one lap or cross seam occur upon another.

Valleys and Gutters—Line all gutters in the same manner as described under "Application," using sheets full length and cut to a width of not over 18 in. After the base sheet of heavy Asbestos Roofing has been nailed in position, then cement 2 sheets of 1-ply Fiberock over the base sheet, breaking joints in the usual manner.

Note: We recommend, wherever possible, adding an additional sheet of 1-ply Fiberock in all valley and gutter construction.

All valley and gutter sheets shall extend on the roof surface sufficiently to be properly lapped with the main roofing sheets, the heavy base sheet of Asbestos Roofing shall extend on all vertical surfaces approximately 2½ in., the extension to be uncemented.

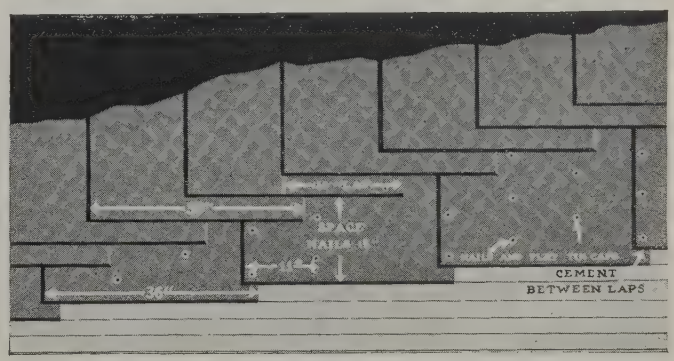
Note: All concrete or brick walls to be flashed shall be primed (Carey Asphalt Primer) to full height of flashing.

Flashing—The general contractor or owner to provide suitable nailing strips in the walls at the time of construction, or raggle block, together with necessary cant strips, nailing strips, etc., to enable the roofing contractor to properly construct flashing work. See flashing details on last page of this catalogue.

Note: Height of flashing, width of cant strip and flashing materials may be regulated to suit height of wall, and other conditions prevailing.

Counterflashing—See "General," Specification No. 5.

Roof Finish—The entire surface of the roofing applied shall be mopped with Carey Manco Asphalt, applied hot and spread to a uniform finish.



Application of Carey Asbestos Built-up Roofing Over Wood Subbase. Specification No. 15

Specification No. 15A

Carey Asbestos Built-up Roofing for Application to Concrete or Gypsum Subbase

General—(Insert paragraph under heading "General," Specification No. 8.)

Work Proposed—This specification contemplates furnishing all materials and labor required to apply the roofing and base flashing, and line the gutters. (No metal work of any kind is included.) Concrete or gypsum must be dry before applying the roofing.

Materials—The materials for each square used in the construction of this roof shall be as follows:

One roll (110 sq. ft.) Asbestos Asphalt-saturated Roofing Felt, weight approximately 60 lb.

One gal. Asphalt Primer, approximately 9 lb.

Continued on next page

Two sheets (weight 15 lb. per sq. each) Carey Fiberock (Asbestos-saturated Felt).

130 lb. Carey Manco Asphalt.

Nails and flat tin caps where required.

Weight per square when applied to be approximately 230 lb.

Application—The concrete or gypsum surfaces shall be coated with Carey Asphalt Primer applied cold and thoroughly brushed in. Allow the Primer to dry, then mop surface with Carey Manco Asphalt, into which, while hot, embed 1 layer of Asbestos Asphalt-saturated Roofing Felt, weighing approximately 60 lb., lapping the sheets not less than 3 in. and cementing between the laps with Manco Asphalt. (When applying over gypsum block, these sheets may be secured by occasional nailing in addition to mopping.) After completing this first layer, mop surface with Carey Manco Asphalt, into which, while hot, embed 2 layers of 1-ply Fiberock (Asphalt-saturated Asbestos Felt) cementing solid between sheets so that felt will not touch felt, each sheet to overlap the previous sheet, leaving 17 in. exposed.

Valleys and Gutters—Line all gutters and valleys in the same manner as described under "Application," using sheets cut to uniform length and to a width of approximately 18 in. After the base sheet of heavy Asbestos Roofing has been placed in position, then cement 2 sheets of 1-ply Fiberock over the base sheet, breaking joints as described under "Application."

Note: We recommended adding an additional sheet of 1-ply Fiberock in the valley and gutter construction or on other sections of the roof that may be subjected to greater abuse or roughly used.

All valley and gutter sheets shall extend on the roof surface sufficiently to be properly lapped with the main roofing sheets. The heavy base sheet of Asbestos Roofing shall extend on all vertical surfaces approximately 2½ in., the extension to be uncemented.

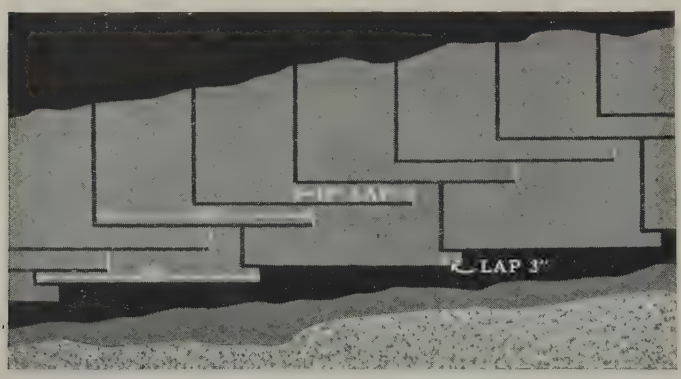
All concrete or brick walls to be flashed, shall be primed (using Carey Asphalt Primer) to full height of flashing.

Flashing—The general contractor or owner to provide suitable nailing strips in the walls at the time of construction, or raggle block, together with necessary cant strips, nailing strips, etc., to enable the roofing contractor to properly construct flashing work. See flashing details on last page of this catalogue.

Note: Height of flashing, width of cant strip, and flashing materials may be regulated to suit the height of wall and other conditions prevailing.

Counterflashing—See "General," Specification No. 8, and refer to details on last page of this catalogue.

Roof Finish—The entire surface of the roofing applied shall be mopped with Carey Manco Asphalt applied hot and spread to a uniform finish.



Application of Carey Built-up Asbestos Roofing Over Concrete or Gypsum Subbase, Specification 15A

Specification No. 18

Four Plies Asphalt-saturated Feltex Over Concrete or Gypsum Subbase

General—(Insert paragraph under heading "General," Specification No. 8.)

Work Proposed—This specification contemplates furnishing all material and labor required to apply the roofing and base flashing and line the gutters. (No metal work of any kind is included.)

Materials—The materials used in the construction of this roof shall be as follows:

	Lb. per square
(a) Carey Asphalt Primer (1 gal.)	9
(b) Carey Manco Asphalt	40
(c) Carey Feltex Felt	15
(d) Carey Manco Asphalt	25
(e) Carey Feltex Felt	15
(f) Carey Manco Asphalt	25
(g) Carey Feltex Felt	15
(h) Carey Manco Asphalt	25
(j) Carey Feltex Felt	15
(k) Carey Manco Asphalt	25

Weight per square when applied to be approximately 209 lb.

Application—The concrete or gypsum surface shall be coated with Carey Asphalt Primer applied cold and thoroughly brushed in. After the Primer dries, mop the surface with Carey Manco Asphalt into which, while hot, embed 4 layers of Carey Feltex (Asphalt-saturated Felt), cementing solid between the sheets so that at no place shall felt touch felt, each sheet to overlap the previous sheet so that approximately 9 in. are left exposed, making nine courses of Asphalt and Felt.

Gutters—Apply 4 layers of Carey Feltex Felt lengthwise with gutter sheets to be cut to uniform length, each sheet to overlap the previous sheet so that ¼ of its length is left exposed.

All gutter sheets shall extend on the roof surface sufficiently to be properly lapped with the main roofing sheets, and are to be applied as specified under "Application."

Note: All concrete or brick walls to be flashed shall be primed to full height of flashing with Carey Asphalt Primer.

Flashing—For base flashing, cement strips of Feltex 6 in. wide, in angle of wall, 3 in. to wall and 3 in. to flat deck. The Feltex sheets from main roof to be cut so that they will extend up on all fire walls, skylights, and other vertical surfaces, to a height of 6 in.; these extensions to be cemented to vertical surfaces excepting where cant strips are used. A cap sheet of Feltex cut 12 in. wide to be cemented in 6 in. to wall and 6 in. to flat deck. See flashing details on last page of this catalogue. General contractor to leave opening in the walls for inserting counterflash.

Counterflashing—See "General," Specification No. 8, and refer to details on last page.

Roof Finish—The entire surface of the roofing applied shall be mopped with Carey Manco Asphalt applied hot and evenly spread to a uniform finish.

Application of Four Plies Asphalt-saturated Feltex Over Concrete or Gypsum Subbase, Specification No. 18

Specification No. 15AA

Carey Asbestos Built-up Roofing Over Wood Subbase

General—(Insert paragraph under heading "General," Specification No. 5.)

Work Proposed—This specification contemplates furnishing all materials and labor required to apply the roofing and base flashing, and line the gutters. (No metal work of any kind is included.) Sheathing must be dry before applying the roofing.

Materials—The materials for each square used in the construction of this roof shall be as follows:

One roll (110 sq. ft.) Carey Asbestos Asphalt Impregnated Roofing Felt, weight approximately 60 lb.

Three sheets (weight 15 lb. per sq. each) Carey Fiberock (Asbestos Impregnated Felt).

100 lb. Carey Manco Asphalt.

Nails and flat tin caps.

Weight per square, when applied, to be approximately 207 lb.

Application—The roof surface shall be covered with Carey Asbestos Asphalt Impregnated Roofing, lapping the sheets so that there will be a lap of not less than 3 in., cementing between the laps with Manco Asphalt, and secure with nails and caps, spacing the nails along the lap 4 in., also

Continued on next page

secure through the center of sheets with 2 rows of nails and flat tin caps staggered, spacing nails crosswise of sheet 11 in., and lengthwise of sheet 15 in. This surface to be mopped with Carey Manco Asphalt into which while hot shall be laid 3 layers of 1-ply Fiberock (Asphalt Impregnated Asbestos Felt), cementing solid between sheets, so that at no place shall felt touch felt, each sheet to overlap the previous sheet, leaving 11 in. exposed. All sheets shall be laid crosswise of the sheathing boards and so lapped that at no place shall one lap or cross seam occur upon another.

Valleys and Gutters—Line all gutters in the same manner as described under "Application," using sheets full length and cut to a width of not over 18 in. After the base sheet of heavy Asbestos Roofing has been nailed in position, then cement 3 sheets of 1-ply Fiberock over the base sheet, breaking joints in the usual manner.

All valley and gutter sheets shall extend on the roof surface sufficiently to be properly lapped with the main roofing sheets, the heavy base sheet of Asbestos Roofing shall extend on all vertical surfaces approximately 2½ in., the extension to be uncemented.

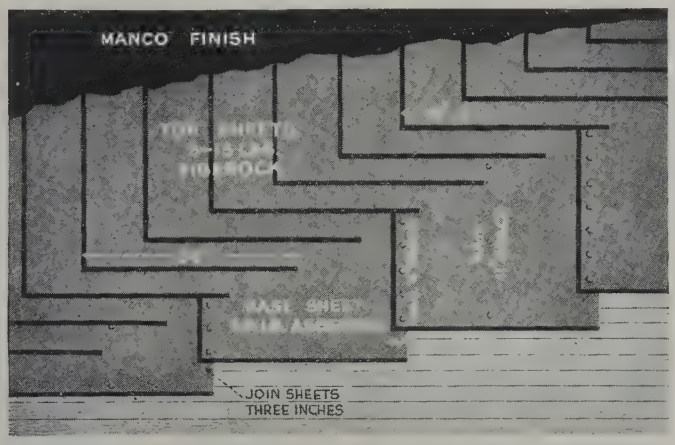
Note: All concrete or brick walls to be flashed shall be primed (Carey Asphalt Primer) to full height of flashing.

Flashing—The general contractor or owner to provide suitable nailing strips in the walls at the time of construction, or raggle block, together with necessary cant strips, nailing strips, etc., to enable the roofing contractor to properly construct flashing work. See flashing details on last page of this catalogue.

Note: Height of flashing, width of cant strip and flashing materials may be regulated to suit height of wall, and other condition prevailing.

Counterflashing—See "General," Specification No. 5, and details on last page.

Roof Finish—The entire surface of the roofing applied shall be mopped with Carey Manco Asphalt, applied hot and spread to a uniform finish.



Application of Carey Asbestos Built-up Roofing Over Wood Subbase, Specification 15AA

Specification No. 15AAA

Carey Asbestos Built-up Roofing Over Concrete or Gypsum Subbase

General—(Insert paragraph under heading "General," Specification No. 8.)

Work Proposed—This specification contemplates furnishing all materials and labor required to apply the roofing and base flashing, and line the gutters. (No metal work of any kind is included.) Concrete or gypsum must be dry before applying the roofing.

Materials—The materials for each square used in the construction of this roof shall be as follows:

One roll (110 sq. ft.) Asbestos Asphalt Saturated and Coated Roofing, weight approximately 60 lb.

One gal. Asphalt Primer, approximately 9 lb.

Three sheets (weight 15 lb. per sq. each) Carey Fiberock (Asbestos Saturated Felt).

150 lbs. Carey Manco Asphalt.

Nails and flat tin caps or large head felt nails.

Weight per square when applied to be approximately 264 lb.

Application—The concrete or gypsum surfaces shall be coated with Carey Asphalt Primer applied cold and thoroughly brushed in. Allow the Primer to dry, then mop surface with Carey Manco Asphalt, into which while hot embed 1 layer of Asbestos Asphalt Saturated Roofing Felt, weighing approximately 60 lb., lapping the sheets not less than 3 in. and cementing between the laps with Manco Asphalt. (When applying over gypsum block, these sheets may be secured by nailing once through the center and along joints, spacing the nails from 6 to 8 in.) After completing this first layer, mop surface with Carey Manco Asphalt, into which while hot embed 3 layers of 1-ply Fiberock (Asphalt Saturated Asbestos Felt), cementing solid between sheets so that felt will not touch felt, each sheet to overlap the previous sheet, leaving 11 in. exposed.

Valleys and Gutters—Line all gutters and valleys in the same manner as described under "Application," using sheets cut to uniform length and to a width of approximately 18 in. After the base sheet of heavy Asbestos Roofing has been placed in position, then cement 3 sheets of 1-ply Fiberock over the base sheet, breaking joints as described under "Application."

All valley and gutter sheets shall extend on the roof surface sufficiently to be properly lapped with the main roofing sheets. The heavy base sheet of Asbestos Roofing shall extend on all vertical surfaces approximately 2½ in., the extension to be uncemented.

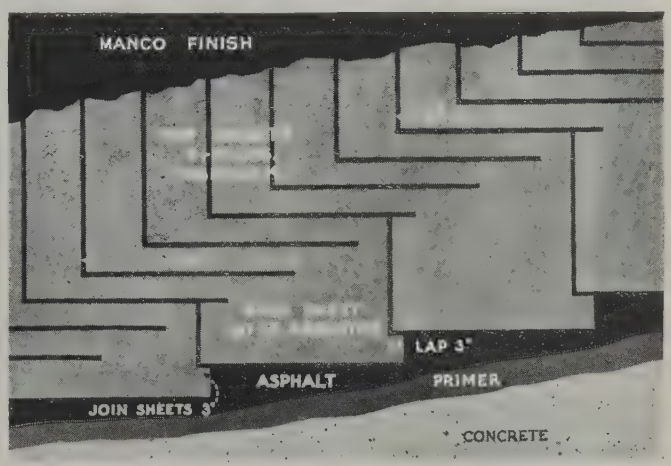
All concrete or brick walls to be flashed, shall be primed (using Carey Asphalt Primer) to full height of flashing.

Flashing—The general contractor or owner to provide suitable nailing strips in the walls at the time of construction, or raggle block, together with necessary cant strips, nailing strips, etc., to enable the roofing contractor to properly construct flashing work.

Note: Height of flashing, width of cant strip and flashing materials, may be regulated to suit the height of wall and other conditions prevailing.

Counterflashing—See "General," Specification No. 8, and details on last page.

Roof Finish—The entire surface of the roofing applied shall be mopped with Carey Manco Asphalt applied hot and spread to a uniform finish.



Application of Carey Asbestos Built-up Roofing Over Concrete or Gypsum Subbase, Specification 15AAA

Specification for Carey Preformed Membrane System of Waterproofing to Wood Subbase

General—(Insert paragraph under heading "General" Specification No. 5.)

Work Proposed—This specification covers material and labor required to properly apply the Carey Preformed Membrane System of Waterproofing to roof surfaces of wood construction.

Materials—Materials used in the construction of this roof shall be as follows:

	Lbs. per square
(a) Carey Preformed Membrane, ⅛ in., size of sheets 3x6 ft.	90
(b) Large Head Roofing Nails, 1 in. in length	3
(c) Carey Manco Asphalt	25
(d) Carey Feltex Asphalt-saturated Felt)	15
(e) Carey Manco Asphalt	25
(f) Carey Feltex (Asphalt-saturated Felt)	15
(g) Carey Manco Asphalt	25

Weight per square, when applied, approximately 198 lb.

Application—The preformed sheets (3x6 ft.) are laid on the roofing boards crosswise of the boards, butting the edges of the sheets closely. The sheets are then nailed along all the edges, spacing the nails on 3-in. centers. Two staggered rows of nails are driven through the middle of the sheets, spaced about 6 in. After the sheets have been nailed securely, fill

Continued on next page

all cracks along the joints with Manco Asphalt, heated and poured at a temperature of about 400° F. A strip of Feltex about 5 in. wide shall then be cemented over the joints. Mop over this surface 2-ply Built-up Feltex Roof composed of two 15-lb. Feltex sheets lapping the sheets ½ their width and embed the sheets into the hot asphalt. No nails to be used through the top sheets. The top sheets may be laid crosswise or with the preformed sheets, as best suits the type of roof construction.

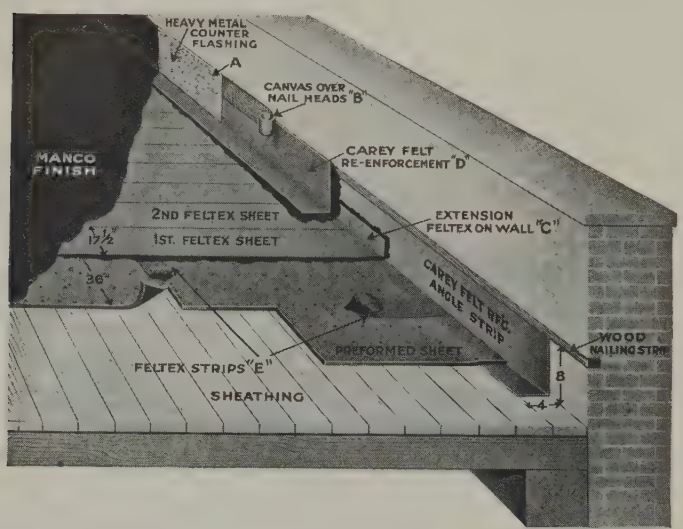
Gutters and Valleys—Line in the same manner as described in "Application."

Flashing—Prime all brick or concrete walls. The general contractor or owner to provide suitable nailing strips in the walls, also cant strips or crickets where necessary. (See illustration on last page of this catalogue for details in constructing flashing.) Height of flashing and flashing materials may be regulated to suit height of wall and other conditions prevailing.

Counterflashing—Illustration below shows two methods of counterflashing.

(a) With heavy galvanized iron or copper. (Recommended.)
(b) By cementing canvas over nail heads.

Roof Finish—The entire surface of the roof shall be mopped with Carey Manco Asphalt, applied at proper temperature and not over 1/16th of an inch in thickness.



Application of Carey Preformed Membrane System of Waterproofing to Wood Subbase

Specifications for Four Plies of Asphalt-saturated Asbestos Felt Over Concrete

General—(Insert paragraph under heading "General," Specification No. 8.)

Work Proposed—This specification contemplates furnishing all material and labor required to apply the roofing and base flashing and line the gutters. (No metal work of any kind is included.)

Materials—The materials used in the construction of this roof shall be as follows:

	Lb. per square
(a) Carey Asphalt Primer (1 gal.)	9
(b) Carey Manco Asphalt	40
(c) Carey Asbestos Felt Fiberock	15
(d) Carey Manco Asphalt	25
(e) Carey Asbestos Felt Fiberock	15
(f) Carey Manco Asphalt	25
(g) Carey Asbestos Felt Fiberock	15
(h) Carey Manco Asphalt	25
(j) Carey Asbestos Felt Fiberock	15
(k) Carey Manco Asphalt	25

Weight per square when applied to be approximately 209 lb.

Application—The concrete surface shall be coated with Carey Asphalt Primer applied cold and thoroughly brushed in. After the primer dries, mop the surface with Carey Manco Asphalt into which, while hot, embed 4 layers of Carey Asbestos (Asphalt-saturated Felt), cementing solid between the sheets so that at no place felt shall touch felt, each sheet to overlap the previous sheet so that approximately 9 in. are left exposed, making 9 courses of asphalt and felt.

Gutters—Apply 4 layers of Carey Asbestos Felt Fiberock lengthwise with gutter sheets to be cut to uniform length, each sheet to overlap the previous sheet so that ¼ of its length is left exposed.

All gutter sheets shall extend on the roof surface sufficiently to be properly lapped with the main roofing sheets, and are to be applied as specified under "Application."

Note: All concrete or brick walls to be flashed shall be primed to full height of flashing with Carey Asphalt Primer.

Flashing—For base flashing, cement strips of Fiberock 6 in. wide, in angle of wall, 3 in. to wall and 3 in. to flat deck. The Feltex sheets from main roof to be cut so that they will extend up on all fire walls, skylights, and other vertical surfaces, to a height of 6 in.; these extensions to be cemented to vertical surfaces excepting where cant strips are used. A cap sheet of Fiberock cut 12 in. wide to be cemented in 6 in. to wall and 6 in. to flat deck. General contractor to leave opening in the walls for inserting counterflash. See flashing details on last page of this catalogue.

Counterflashing—See "General," Specification No. 8, and details on following page.

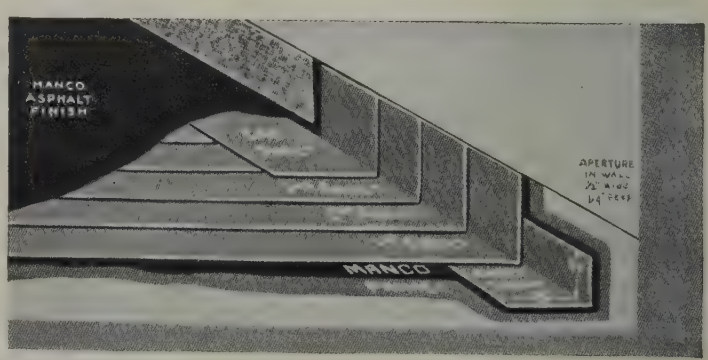
Roof Finish—The entire surface of the roofing applied shall be mopped with Carey Manco Asphalt applied hot and evenly spread to a uniform finish.

Application of Four Plies of Asphalt-saturated Asbestos Felt Over Concrete Subbase

Method of Flashing Built-up Roofs

Method of Flashing Asbestos and Asphalt Built-up Roof Over Concrete Subbase

The illustration shows method of flashing concrete surface without the use of a cant strip. Where the building is new and there is no specification for the flashing the roofer generally submits his proposal based on supplying a flashing to meet the particular requirements of the building or the roof construction. If a completed building and the job is re-roofing, the roof contractor will naturally recommend the type of flashing that best meets the requirements. Carey Specification No. 8 is illustrated in the drawing. The main roof deck is covered with 3 sheets of 15-lb. Feltex but in the flashing as outlined it requires the use of 5 thicknesses of felt in the angle of the wall or for the base flashing. First a strip of felt called the angle strip is fitted in the angle of the wall, next the 3 layers of felt from the main deck are extended on to the wall to the desired height and finally another strip of felt for a cap sheet completes the fifth layer of felt giving the roof extra



Method of Flashing Asbestos and Asphalt Built-up Roof Over Concrete. Specification No. 8

Continued on next page

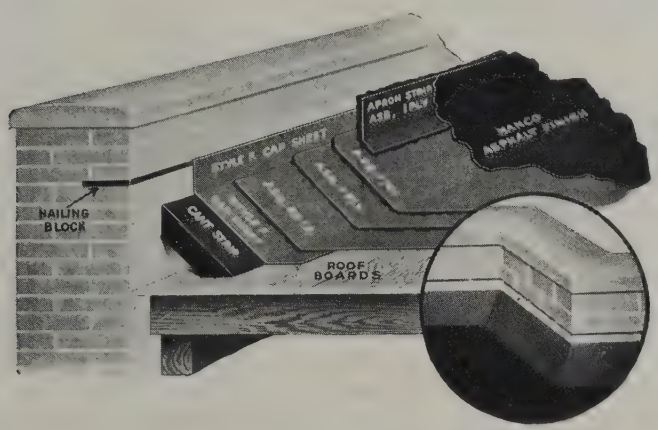
strength at this particular point. Over the base flashing a counterflashing of metal may be used.

Flashing Carey Asbestos Built-up Roofs

In this type of flashing which is suitable for either concrete or wood surfaces all metal is disposed of, almost entire flashing being completed with asbestos materials.

This type of flashing calls for the use of a cant strip which can be built in the angle of the wall either with wood, composition or, if a concrete deck, concrete. The roof construction shown in the illustration is Carey Asbestos Built-up Roof Specification No. 15., in which case the use of the style "F" flashing material cap sheet is laid as a base sheet underneath the main roof in order that the greatest resistance to natural wear will be afforded and the asbestos sheets given the greatest protection. The cap sheet style "F" is attached to the nailing strip in the wall and if a raggle block is used the top edge is fastened in the raggle. The sheet extends down over the cant strip and out on the main roof approximately 6 in. In preparing flashing work, all sheets may be cut to suit the height of the wall and the general conditions prevailing. The cap sheet may be nailed at the lower end on the roof deck sufficiently to hold it in place. In this specification the base sheet is of heavy asbestos weighing approximately 60 lb. per square. This sheet is run from the main deck up to the top edge of the cant strip. The 2 top sheets consisting of two 15 lb. asbestos sheets are feather-edged to the vertical wall over the style "F" cap sheet, the first sheet extends about 1 inch on the wall and the second about 2 inches, as shown in the illustration.

The apron strip covers the nail heads and serving as a counter-flashing is usually 5 to 6 in. in width, being laid in Fiberock cement. It is best to set this in place and then tamp it in carefully so that every portion of the strip will adhere. The entire surface of the completed flashing is then mopped with Manco asphalt.

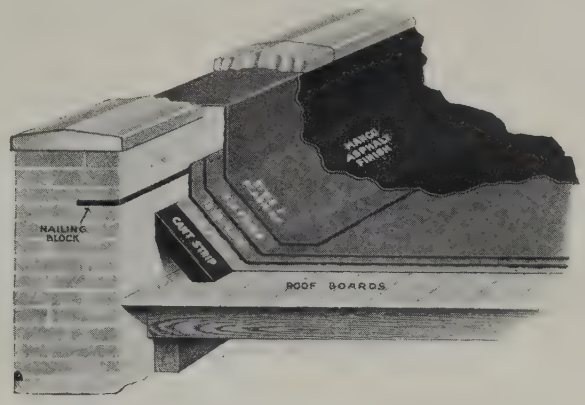


Method of Flashing Asbestos Built-up Roof

Wall and Roof Flashing

The most effective means of protecting both the wall and roof against leakage is the method of flashing illustrated herein. The cant strip is used to bridge the wall angle. First the heavy base sheet of roofing is laid to the top edge of the cant strip, the lighter roofing sheets from the main deck are laid to the top edge of the nailing strip in the wall and there secured by nailing to hold them in place. Over all is laid a cap sheet of style "F" flashing material that bridges the angle over cant strip extending from under the coping and out on to the roof deck approximately 4 in. This sheet is cemented solid with hot asphalt.

We recommend the use of the cant strip with this particular type of flashing although practically the same method may be used omitting the cant strip. The use of a cant strip makes the flashing more substantial and offers greater resistance to the natural wear and tear of the flashing. When the cant strip is not used, first cement in the angle of the wall a strip of 30 lb. Feltex at least 12 in. wide, 6 in. extending on the vertical wall and 6 in. on the roof deck. This strip cemented in solid. Then allow the roofing sheets from the main deck to extend on the vertical wall about 2 or 3 inches, uncemented. Cement another cap sheet of 30 lb. Feltex starting from the edge of the coping down the wall to roof deck, out on roof deck at least 4 in., cemented in solid, over this cement a cap sheet of style "F" roofing extending from underneath the coping down the wall and out on to the roof at least 5 to 6 in.



Application of Wall and Roof Flashing

Raggle Block Flashing

The purpose of the raggle block is to provide an anchorage for the flashing strips to hold them permanently in place and to complete a water-tight barrier between the roof and the wall. Some raggle blocks are provided with 2 openings, 1 to receive the base flashing sheets and the other or upper opening for the inserting of the counter-flashing. The roofing sheets must be anchored in the raggle block by the use of plugs, oakum or other devices to insure their remaining in place.

The illustration shows the use of the customary cant strip in the wall angle in addition to the raggle block. It will be noticed that the main roofing sheets are run to the top edge of the cant strip cemented in place, over which is applied a cap sheet of Carey style "F" flashing, the upper edge of which is inserted in the raggle block and sufficiently anchored therein to hold firmly in place. The style "F" extending from the raggle out on to the roof deck at least 4 in. In addition to this there may be used a counterflashing of heavy galvanized iron or copper which offers an additional safeguard. In the case of concrete decks, the cant strip can be molded into place by the cement contractor at the time of the roof construction.

CERTAIN-TEED BUILT-UP ROOFS

Advantages—Roofs built up of Certain-teed asphalt roofing and asphalt cement have many advantages over the old-fashioned coal-tar, pitch and gravel roofs. They can be used on roof decks ranging from flat to vertical surfaces, and are particularly well adapted to sawtooth skylights and valley construction.

The saving in weight when using built-up roofing is of utmost importance, especially on roofs covering extensive areas. Again, tar pitch has a very low melting point and will run off the roof in summer unless covered with weighty slag or gravel.

Maintenance—Certain-teed Built-up Roofs are practically free of maintenance costs. At the end of the guarantee period, these Certain-teed Roofs can generally be resurfaced with hot asphalt, which prolongs their life for many additional years. This resurfacing process when repeated at certain intervals makes the roof last indefinitely.

Principal Types—We have developed several principal types of built-up asphalt roofs. We recommend these roofs for any type of building upon which a composition roof can be applied.

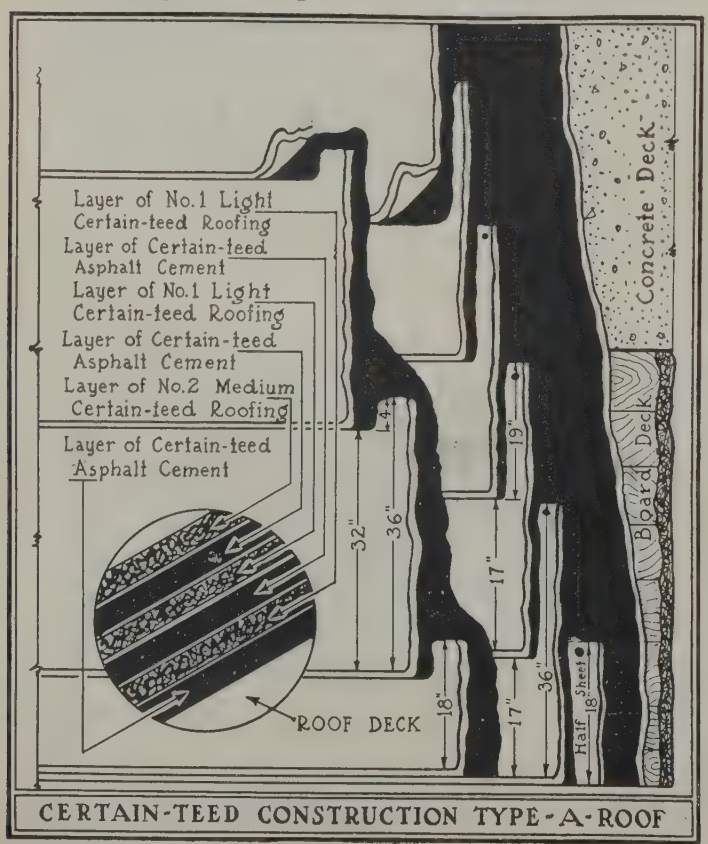
When the very best roof is desired, we recommend Certain-teed Type "A" and Type "B" Construction Roofs.

Certain-teed Type "A" Construction Roof

Guaranteed 15 Years

This form of construction is applicable where the roof deck is of board sheathing, concrete, gypsum tile, cement tile, book tile or steel deck.

The roof decks of wood must be well seasoned and well nailed, and all roof decks must be smooth and dry, and evenly graded to gutters and outlets.



CERTAIN-TEED CONSTRUCTION TYPE-A-ROOF

Type "A" construction is applicable to a roof deck of any incline, from a comparatively flat deck to the vertical wall of a pent house or roof house and is especially recommended for sawtooth skylight construction and valleys.

Certain-teed Type "A" Construction Roof is composed of the following, per square of roof area.

2 squares of No. 1 Smooth Certain-teed Roofing, weighing 30 lb. each	60 lb.
1.08 squares of No. 2 Smooth Certain-teed Roofing	40 lb.
Certain-teed Asphalt Cement	120 lb.
Total	220 lb.

Specifications for Certain-teed Type "A" Construction Roof

Notes: This roof is guaranteed for 15 years.

This specification is applicable where the roof surfaces are of wood sheathing boards, concrete, gypsum tile, cement tile, book tile or steel deck; also for roofs of any pitch, from flat decks to vertical walls; sawtooth roof construction and valleys.

General—All roof (and side wall) surfaces, where indicated on the drawings, shall be covered with Certain-teed Type "A" Construction Roofing in strict accordance with these specifications and the special instructions of the manufacturer.

This Contractor shall examine all surfaces to be covered and shall see that they are smooth and evenly graded to gutters and outlets, also that they are thoroughly dry. Where surface is of wood, the wood must be well seasoned and well nailed. If surfaces and materials are not satisfactory he shall report the defects to the General Contractor who will see that the work is rectified. All surfaces shall be broom clean before the roofing material is applied.

Note: The required materials and workmanship for the surfaces to receive roofing should be included in the specifications for Mason and Carpenter Work.

Materials—The material shall be 2 sheets of No. 1 Light Certain-teed Roofing, weighing 30 lb. to the roll of 108 sq. ft., single thickness, and one sheet (the cap sheet) No. 2 Medium Certain-teed Roofing, weighing 40 lb. to the roll of 108 sq. ft., single thickness, and not less than 120 lb. of Certain-teed Asphalt Cement to the 100 sq. ft. of roof area.

Continued on next page

Application—Beginning at the low point of the roof deck, lay one-half sheet of No. 1 Light Certain-teed Roofing, mopping same to the roof deck with Certain-teed Asphalt Cement applied at a temperature of approximately 300 degrees F., mopping the underneath side of the sheet being laid, its full width, as well as the roof deck. Then lay the second sheet, which is 36 in. wide, so that the edge comes even with the outside edge of the half sheet, mopping the underneath side of this sheet its full width, as well as the top surface of the sheet previously laid. Lay the third sheet so that it laps over the second sheet 1 in. more than half its width (19 in.), mopping both the underneath side of this sheet its full width, and the top surface of the sheet previously laid. In the same manner lay the succeeding layers, completing the roof with the same lap, so that the entire area has two thicknesses of Certain-teed Roofing and 4 layers of Certain-teed Asphalt Cement at every point. Then lay the cap sheet of No. 2 Medium Certain-teed Roofing, starting at the original low point, mopping the underneath side of this sheet its full width, as well as the top surface of the sheet previously laid. Lap this cap sheet 4 in., thus having 3 thicknesses of roofing and 6 layers of Certain-teed Asphalt Cement at every point. The top edge of the roofing shall be nailed when necessary on steep or vertical surfaces. Such nails shall be covered with no less than two layers of asphalt and one layer of roofing. Finally, the laps shall be mopped with hot Certain-teed Asphalt Cement to a distance of approximately 2 in. each side of the lap.

Note: In cases where the roof surfaces are of open board sheathing and not plastered or otherwise ceiled, the above paragraph should be revised to include the following procedure.

(To lay the first sheet of roofing dry on the boards, nailing with two rows of ⅞ in. large-head roofing nails, staggered, on the upper or back half of the sheet, mopping between plies as described above and coating over the entire top surface of the finished roof with a uniform coat of hot Certain-teed Asphalt Cement, thus giving the same weight and amount of material but putting the extra coat of asphalt over the top surface instead of on the board sheathing.)

Flashings—Base flashings shall be constructed by extending the roofing up the wall not less than 6 in. and securing the top edge with standard roofing cleats, unless otherwise specified or shown on the detailed drawings.

Notes: The following notes regarding various types of flashings are suggested for architects' consideration. When other than the above specified flashing is desired the Mason and Carpenter Specifications should include the proper provisions to receive the type of flashing selected, also the above paragraph (Flashings) should be revised accordingly.

Certain-teed flashings can be counterflashed with sheet metal or entered into raggle blocks. If Certain-teed flashing is entered into raggle blocks, same shall be calked in with tarred oakum and pointed with Certain-teed Plastic Cement. For brick walls, we recommend 50 lb. Certain-teed counterflashing, 12 in. wide, be laid up in the third or fourth course of brick above the roof line by the bricklayer, to be used as counterflashing by the roofer. All concrete or tile walls extending above the roof line, where raggle block or metal counterflashing is not provided, shall have a wood nailing strip embedded 6 or 8 in. above the roof line, so that the top edge of flashing can be permanently secured. The drip edge of concrete decks, vertical walls and curbs, shall be provided with wood nailing strips.

Identification and Labels—The materials above mentioned, shall bear the registered Certain-teed labels of the manufacturer, the Certain-teed Products Corporation.

Guarantee—This Contractor shall guarantee in writing, all roofing work for a period of fifteen (15) years from date of laying against all defects in materials and workmanship.

Any leaks that may develop in this roof within the period of this guarantee, due to defective material or workmanship furnished by this contractor, shall be repaired free of cost to the owner.

Certain-teed Type "B" Construction Roof

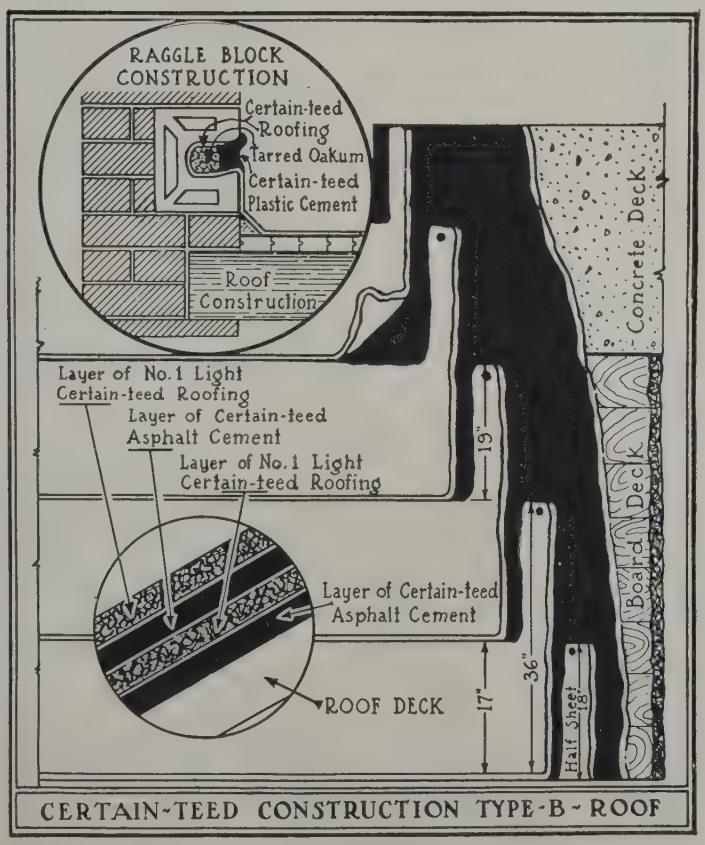
Guaranteed 10 Years

Type "B" construction applicable where the roof deck is of board sheathing, concrete, gypsum tile, cement tile, book tile or steel deck. The roof deck may be of any incline, from an approximately flat deck to a vertical wall of pent house or roof house construction. It is especially recommended for sawtooth skylight construction and valleys.

Roof decks of wood must be well seasoned and well nailed, and all roof decks must be smooth and dry, and evenly graded to gutters and outlets.

Certain-teed Type "B" Construction Roof is composed of the following, per square of roof area.

2 Squares of No. 1 Smooth Certain-teed Roofing, weighing 30 lb. each	60 lb.
Certain-teed Asphalt Cement	90 lb.
Total	150 lb.



CERTAIN-TEED CONSTRUCTION TYPE-B-ROOF

Specifications for Certain-teed Type "B" Construction Roof

Notes: This roof is guaranteed for 10 years.

This specification is applicable where the roof surfaces are of wood sheathing boards, concrete, gypsum tile, cement tile, book tile or steel deck; also for roofs of any pitch, from flat decks to vertical walls; sawtooth roof construction and valleys.

General—All roofs (and side wall) surfaces, where indicated on the drawings, shall be covered with Certain-teed Type "B" Construction Roofing in strict accordance with these specifications and the special instruction of the manufacturer.

This Contractor shall examine all surfaces to be covered and shall see that they are smooth and evenly graded to gutters and outlets, also that they are thoroughly dry. Where surface is of wood, the wood must be well seasoned and well nailed. If surfaces and materials are not satisfactory he shall report the defects to the General Contractor who will see that the work is rectified. All surfaces shall be broom clean before the roofing material is applied.

Note: The required materials and workmanship for the surfaces to receive roofing should be included in the specifications for Mason and Carpenter Work.

Material—The material shall be 2 sheets of No. 1 Light Certain-teed Roofing, weighing 30 lb. to the roll of 108 sq. ft., single thickness, and not less than 90 lb. of Certain-teed Asphalt Cement to the 100 sq. ft. of roof area.

Application—Beginning at the low point of the roof deck, lay one-half sheet of No. 1 Light Certain-teed Roofing, mopping same to the roof deck with Certain-teed Asphalt Cement applied at a temperature of approximately 300 degrees F., mopping the underneath side of the sheet being laid, its full width, as well as the roof deck. Then lay the second sheet, which is 36 in. wide, so that the edge comes even with the outside edge of the half sheet, mopping the underneath side of this sheet its full width, as well as the top surface of the sheet previously laid. Lay the third sheet so that it laps over the second sheet 1 in. more than half its width (19 in.), mopping both the underneath side of this sheet its full width, and the top surface of the sheet previously laid. In the same manner lay the succeeding layers, completing the roof with the same lap, so that the entire area has two thicknesses of Certain-teed Roofing and 4 layers of Certain-teed Asphalt Cement at every point. The top edge of the roofing shall be nailed when necessary on steep or vertical surfaces. Such nails shall be covered with no less than two layers of asphalt and one layer of roofing. Finally, the lap shall be mopped with hot Certain-teed Asphalt Cement to a distance of approximately 2 in. each side of the lap.

Note: In cases where the roof surfaces are of open board sheathing and not plastered or otherwise ceiled, the above paragraph should be revised to include the following procedure.

(To lay the first sheet of roofing dry on the boards, nailing with two rows of ⅞ in. large-head roofing nails, staggered, on the upper or back half of the sheet, mopping between plies as described above and coating over the entire top surface of the finished roof with a uniform

Continued on next page

coat of hot Certain-teed Asphalt Cement, thus giving the same weight and amount of material but putting the extra coat of asphalt over the top surface instead of on the board sheathing.)

Flashings—Base flashings shall be constructed by extending the roofing up the wall not less than 6 in. and securing the top edge with standard roofing cleats, unless otherwise specified or shown on the detailed drawings.

Notes: The following notes regarding various types of flashings are suggested for architects' consideration. When other than the above specified flashing is desired the Mason and Carpenter Specifications should include the proper provisions to receive the type of flashing selected; also the above paragraph (Flashings) should be revised accordingly.

Certain-teed flashings can be counterflashed with sheet metal or entered into raggle blocks. If Certain-teed flashing is entered into raggle block, same shall be calked in with tarred oakum and pointed with Certain-teed Plastic Cement. For brick walls, we recommend 50 lb. Certain-teed counterflashing, 12 in. wide, be laid up in the third or fourth course of brick above the roof line by the bricklayer, to be used as counterflashing by the roofer. All concrete or tile walls extending above the roof line, where raggle block or metal counterflashing is not provided shall have a wood nailing strip embedded 6 to 8 in. above the roof line, so that top edge of flashing can be permanently secured. The drip edge of concrete decks, vertical walls and curbs, shall be provided with wood nailing strips.

Identification and Labels—The materials above mentioned shall bear the registered Certain-teed labels of the manufacturer, the Certain-teed Products Corporation.

Guarantee—This Contractor shall guarantee in writing, all roofing work for a period of ten (10) years from date of laying against all defects in material and workmanship. Any leaks that may develop in this roof within the period of this guarantee, due to defective material or workmanship furnished by this contractor, shall be repaired free of cost to the owner.

Certain-teed Asphalt Felt and Asphalt Built-up Roof on Wood and Masonry Surface

Guaranteed 10 Years

This is a form of roofing employed over wood sheathing, concrete, gypsum, cement tile, book tile, steel deck, etc., of any pitch, from a comparatively flat deck to the vertical wall, and is especially recommended for saw-tooth skylight construction and valleys.

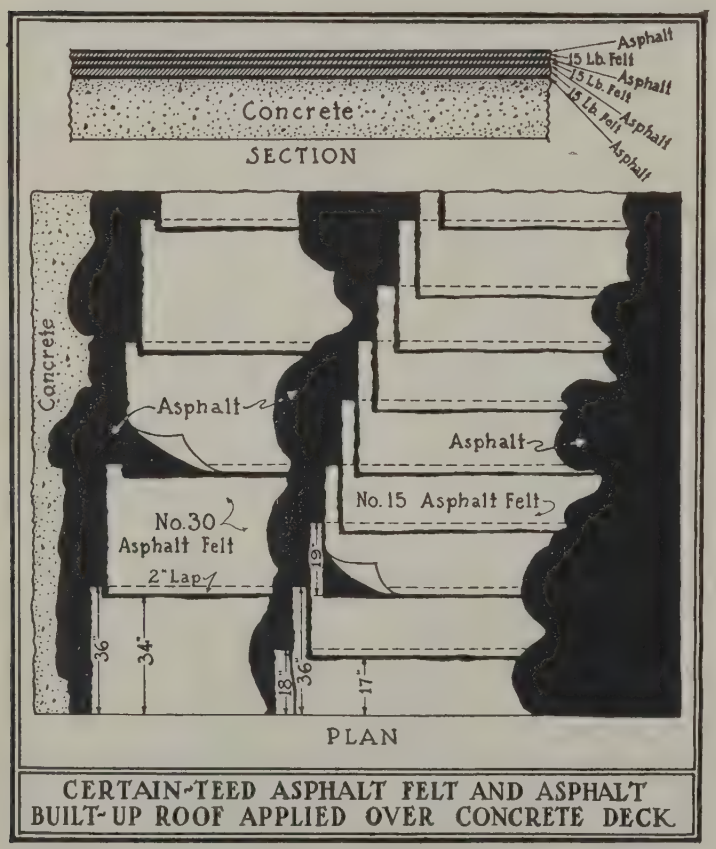
The roof decks must be smooth and dry, and evenly graded to gutters and outlets. Wood surfaces must be well seasoned and well nailed.

Asphalt Felt and Asphalt Built-up Roof over masonry is composed of the following, per square of roof area.

No. 30 Asphalt Saturated Felt per square	30 lb.
No. 15 Asphalt Saturated Felt per square (2 layers 30 lb. each)	60 lb.
Certain-teed Asphalt Cement	120 lb.
Total	210 lb.
When Asphalt Primer is required	1 gal.

Asphalt Felt and Asphalt Built-up Roof over wood is composed of the following, per square of roof area.

No. 30 Asphalt Saturated Felt per square	30 lb.
No. 15 Asphalt Saturated Felt per square (2 layers 30 lb. each)	60 lb.
Certain-teed Asphalt Cement	90 lb.
Total	180 lb.



CERTAIN-TEED ASPHALT FELT AND ASPHALT BUILT-UP ROOF APPLIED OVER CONCRETE DECK

Specifications for Certain-teed Asphalt Felt and Asphalt Built-up Roof on Masonry Surface

Notes: This roof is guaranteed for 10 years.

This specification is applicable where the roof surfaces are of concrete, gypsum tile, cement tile, book tile, steel deck, etc.; also for roofs of any pitch, from flat decks to vertical walls; sawtooth roof construction and valleys.

General—All roof (and side wall) surfaces, where indicated on the drawings, shall be covered with Certain-teed Asphalt Felt and Asphalt Built-up Roofing in strict accordance with these specifications and the special instructions of the manufacturer.

This Contractor shall examine all surfaces to be covered and shall see that they are smooth and evenly graded to gutters and outlets, also that they are thoroughly dry. If surfaces and materials are not satisfactory he shall report the defects to the General Contractor who will see that the work is rectified. All surfaces shall be broom clean before the roofing materials are applied.

Note: The required materials and workmanship for the surfaces to receive roofing should be included in the specifications for Mason Work.

Material—The material shall be one sheet of No. 30 Certain-teed Asphalt Felt, weighing approximately 30 lb. per 108 sq. ft., single thickness, and 2 sheets of No. 15 Certain-teed Asphalt Saturated Rag Felt, weighing approximately 15 lb. per 108 sq. ft., single thickness (the felt shall be 36 in. wide), and not less than 120 lb. of Certain-teed Asphalt Cement to the 100 sq. ft. of roof area. Asphalt to be applied at a temperature of approximately 350 degrees F.

Note: Where a priming coat is desired on the surfaces to be covered, include the following paragraph under above heading (Material):

(For the priming coat use not less than one gal. to 100 sq. ft. of Certain-teed Liquid Asphalt Cement, applied cold.)

Application—All surfaces to be covered shall receive a priming coat of Certain-teed Liquid Asphalt Cement, applied cold and well brushed in, using not less than 1 gal. to 100 sq. ft. Primer shall be allowed to dry before applying the hot asphalt.

Note: If primer is not desired, omit the above paragraph.

Beginning at the low point of the roof deck, lay one layer of 30 lb. Certain-teed Asphalt Felt, lapping each sheet 2 in., mopping same to the roof deck with approximately 30 lb. Certain-teed Asphalt Cement to the square. Over the 30 lb. Asphalt Saturated Felt thus laid, mop approximately 30 lb. of Certain-teed Asphalt Cement to the square, into which, while hot, lay 2 layers of 15 lb. Certain-teed Asphalt Felt (starting with one-half sheet), lapping each sheet 19 in. and mopping between sheets the full width of the lap with Certain-teed Asphalt Cement, using approximately 30 lb. of asphalt per square. Over the entire surface of the felt thus laid, mop a uniform coat of Certain-teed Asphalt Cement, using approximately 30 lb. of asphalt per square. This final or top coating shall be applied as the work progresses so that the felt shall not be left exposed.

Flashings—Base flashings shall be constructed by extending the felt up the wall not less than 6 in. Over the base flashing mop a strip of 15 lb. Asphalt Saturated Felt approximately 6 in. wide, the top edge of the felt shall be secured with a standard roofing cleat, unless otherwise specified or shown on the detailed drawings.

Notes: The following notes regarding various types of flashings are suggested for architects' consideration. When other than the above specified flashing is desired the Mason and Carpenter Specifications should include the proper provisions to receive the type of flashing selected, also the above paragraph (Flashings) should be revised accordingly.

Base flashings can be counterflashed with sheet or metal or entered into raggle blocks. If the asphalt felt base flashing is entered into raggle blocks, it shall be calked in with tarred oakum and pointed up with Certain-teed Plastic Cement. All concrete or tile walls extending above the roof line where raggle block or metal counterflashing is not provided, shall have a wood nailing strip embedded 6 or 8 in. above the roof line so that the top edge of the flashing can be permanently secured.

Identification and Labels—The materials above mentioned, shall bear the registered Certain-teed label of the manufacturer, the Certain-teed Products Corporation.

Guarantee—This Contractor shall guarantee in writing, all roofing work for a period of ten (10) years from date of laying against all defects in materials and workmanship. Any leaks that may develop in this roof within the period of this guarantee, due to defective material or workmanship furnished by the contractor, shall be repaired free of cost to the owner.

CERTAIN-TEED ASPHALT FELT AND ASPHALT BUILT-UP ROOF APPLIED OVER BOARD SHEATHING

Specifications for Certain-teed Asphalt Felt and Asphalt Built-up Roof on Board Sheathing

Notes: This roof is guaranteed for 10 years.

This specification is applicable where the roof surfaces are of wood sheathing; also for roofs of any pitch, from flat decks to vertical walls; sawtooth roof construction and valleys.

General—All roof (and side wall) surfaces, where indicated on the drawings, shall be covered with Certain-teed Asphalt Felt and Asphalt Built-up Roofing in strict accordance with these specifications and the special instructions of the manufacturer.

This Contractor shall examine all surfaces to be covered and shall see that the wood sheathing is well seasoned, well nailed, dry, smooth and evenly graded to gutters and outlets. If surfaces and materials are not satisfactory he shall report the defects to the General Contractor who will see that the work is rectified. All surfaces shall be broom clean before the roofing material is applied.

Note: The required materials and workmanship for the surfaces to receive roofing should be included in the specifications for Carpenter Work.

Material—The material shall be one sheet of No. 30 Certain-teed Asphalt Felt, weighing approximately 30 lb. per 108 sq. ft., single thickness, and 2 sheets of No. 15 Certain-teed Asphalt Saturated Rag Felt, weighing approximately 15 lb. per 108 sq. ft., single thickness (the felt shall be 36 in. wide), and not less than 90 lb. of Certain-teed Asphalt Cement to the 100 sq. ft. of roof area. Asphalt to be applied at a temperature of approximately 350 degrees F.

Application—Beginning at the low point of the roof deck, lay one layer of 30 lb. Certain-teed Asphalt Felt, lapping each sheet 2 in. and nailing through the laps and longitudinal centers with large-head, barbed roofing nails, 12 in. on center. Over the 30 lb. Asphalt Saturated Felt thus laid, mop approximately 30 lb. of Certain-teed Asphalt Cement, into which, while hot, lay 2 layers of 15 lb. Certain-teed Asphalt Felt (starting with one-half sheet), lapping each sheet 19 in. and mopping between sheets the full width of the lap with Certain-teed Asphalt Cement, using approximately 30 lb. of asphalt per square. Over the entire surface of the felt thus laid, mop a uniform coat of Certain-teed Asphalt Cement, using approximately 30 lb. of asphalt per square. This final or top coating shall be applied as the work progresses so that the felt shall not be left exposed.

Flashings—Base flashings shall be constructed by extending the felt up the wall not less than 6 in. Over the base flashing mop a strip of 15 lb. Asphalt Saturated Felt approximately 6 in. wide, the top edge of the felt shall be secured with a standard roofing cleat, unless otherwise specified or shown on the detailed drawings.

Notes: The following notes regarding various types of flashings are suggested for architects' consideration. When other than the above specified flashing is desired the Mason and Carpenter Specifications should include the proper provisions to receive the type of flashing selected, also the above paragraph (Flashing) should be revised accordingly.

Base flashings can be counterflashed with sheet metal or entered into raggle blocks. If the asphalt felt base flashing is entered into raggle blocks, it shall be calked in with tarred oakum and pointed up with Certain-teed Plastic Cement. All concrete or tile walls extending above the roof line where raggle block or metal counterflashing is not provided, shall have a wood nailing strip embedded 6 or 8 in. above the roof line so that the top edge of the flashing can be permanently secured.

Identification and Labels—The materials above mentioned shall bear the registered Certain-teed labels of the manufacturer, the Certain-teed Products Corporation.

Guarantee—This Contractor shall guarantee in writing, all roofing work for a period of ten (10) years from date of laying against all defects in materials and workmanship. Any leaks that may develop in this roof within the period of the guarantee, due to defective material or workmanship furnished by this contractor, shall be repaired free of cost to the owner.

SPECIFICATION (BUILT-UP) ROOFING.

For other Johns-Manville Products, see pages in this edition, as follows:

Acoustical Treatment .....page A15
Transite Corrugated Asbestos.....page A175
Waterproofing and Dampproofing.....page A79
Rigid Asbestos Shingles.....page A478
Pipe Coverings and Insulations.....page B1672
Asbestos Ebony and Electrical Products.....page C3413

Also Packings for all purposes; Floorings; Refractory Cements and Furnace Linings; Asbestos Wood; Insulating Lumber; Asbestos Products of all kinds.

Specification (Built-up) Roofing

Applied only by the manufacturer or by approved roofing contractors.

A Johns-Manville Specification Roof consists of successive layers of asphalt impregnated felts embedded in and covered by asphalt. It has a smooth, black wearing surface; it will not rot or dry out; it does not need periodic repairs; and it is fireproof. No slag or gravel is ever used or needed on a Johns-Manville Roof. It will withstand the action of the elements because of the materials of which it is made.

Combinations of the materials listed below are used to make the three types of Johns-Manville Specification Roofs.

Materials—(1) Johns-Manville Standard Asbestos Built-up Roofing Felt—32-in. wide, asphalt-impregnated asbestos felt—60 lb. per square.

(2) Johns-Manville Asbestos Roofing Felt 15 lb.—32-in. wide, asphalt-impregnated asbestos felt—15 lb. per square.

(3) Johns-Manville No. 30 Base Felt—36-in. wide, asphalt-saturated rag felt—30 lb. per square.

(4) Johns-Manville Asphalt Roofing Cement.

(5) Johns-Manville Asphalt Concrete Primer.

Types of Specification Roofs—

Super Class A—Underwriters' Laboratories Classification. Composed of a base layer of Johns-Manville Standard Asbestos Roofing Felt 60 lb., and three layers of Johns-Manville Asbestos Roofing Felt 15 lb. Weighs 220 lb. per square over combustible construction and 250 lb. over non-combustible construction.

Class A—Underwriters' Laboratories Classification. Similar to Super Class A, except that there are only two layers of the 15-lb. cap felt. Weighs 175 lb. per square over combustible construction and 205 lb. over non-combustible construction.

Combination—Similar to Class A, except that the base felt is Johns-Manville No. 30. Weighs 145 lb. per square over combustible construction, and 175 lb. over non-combustible construction.

Johns-Manville Service

Architects are urged to avail themselves of the free service of Johns-Manville Architects' Service Section and roofing engineers for consultation on any roofing problems.

Write for our detailed specifications.

Products

For the Roof:

Bonded Tarred Felt; Standard Tarred Felt; Asphalt Felt; Bonded Pitch; Victory Pitch; Standard Refined Tar; Liquid Roof Coating; Fibre Roof Coating; Plastic Cement.

For Other Constructions:

Slaters Felt; Threaded Felt; Waterproofing Pitch and Coating; Special Tar Paint; Wood Preservative.

For the Road and Walk:

Road Tars and Paving Pitch; Hot or Cold Patching Tar.

"Built-up Roofs"

Our Standard Tarred Felt and Victory Pitch used in the construction of built-up tarred felt, pitch and gravel roofs, are manufactured in accordance with the requirements of the U. S. Government Master Specifications, Underwriters' Laboratories, Inc. and the United Roofing Contractors Association of America. These products are accorded Class "A" rating by the Underwriters' Laboratories, Inc. and may be obtained with the Underwriters' labels, U.R.C.A. labels and our own manufacturer's labels, upon request.

Bonded Roofs—Our Bonded Felt and Bonded Pitch are especially selected for use only on 10-year and 20-year Bonded Roofs. A surety bond issued by the National Surety Company is furnished only upon completion of a 10-year or 20-year Bonded Roof, which has been subject to the rigid inspection of our own inspector during its entire construction by a reliable, responsible and approved roofing contractor. Specifications on our Bonded Roof provide for 5-ply construction for use over boards (entitled to 20-year guarantee bond) and 4-ply construction for use over boards (entitled to 10-year guarantee bond); also, 4-ply construction for use over concrete (entitled to 20-year guarantee bond) and 3-ply construction for use over concrete (entitled to 10-year guarantee bond).

Standard Construction Roofs—Where the surety bond and expert inspection service are not essentially of interest, the application of our Standard Tarred Felt and Victory Pitch in accordance with approved specifications, using 4-ply and 5-ply over boards and 3-ply and 4-ply over concrete, represent the most modern and satisfactory type of approved roof construction.

Specifications of Bonded Roofs

5-ply Roof for Use over Boards, 20-Year Guarantee Bond—(Applies for flat surfaces or where the grade does not exceed two (2) inches per foot.)

The roof deck shall be of seasoned lumber, smooth and free from loose boards, large cracks or knotholes, and free from loose material. If roof deck slopes, it shall be properly graded to outlets.

(a) Lay one (1) thickness of sheathing paper or unsaturated felt weighing not less than five (5) pounds per one hundred (100) square feet, lapping the sheets at least one (1) inch.

(b) Over the entire surface lay two (2) plies of Bonded Tarred Felt, lapping each sheet seventeen (17) inches over preceding one and nail as often as is necessary to hold in place until remaining felt is laid.

(c) Coat the entire surface uniformly with Bonded Pitch.

(d) Over the entire surface lay three (3) plies of Bonded Tarred Felt, lapping each sheet twenty-two (22) inches over preceding one, mopping with Bonded Pitch the full twenty-two (22) inches on each sheet, so that in no place shall felt touch felt. Such nailing as is necessary shall be done so that all nails will be covered by not less than two (2) plies of felt.

(e) Over the entire surface pour from a dipper a uniform coating of Bonded Pitch, into which, while hot, embed not less than four hundred (400) pounds of gravel or three hundred (300) pounds of slag for each one hundred (100) square feet. The gravel or slag shall be from one-quarter (¼) inch to five-eighths (⅝) inch in size, dry and free from dirt.

The felt shall be laid without wrinkles or buckles. Not less than one hundred and fifty (150) pounds of pitch shall be used for constructing each one hundred (100) square feet of completed roof, and the pitch shall not be heated above four hundred (400) degrees Fahrenheit.

(f) The use of copper or lead for flashings and counterflashings is recommended.

*(g) See Note below.

4-ply Roof for Use over Boards, 10-year Guarantee Bond—(Applies for flat surfaces or where the grade does not exceed two (2) inches per foot.)

The roof deck shall be of seasoned lumber, smooth and free from loose boards, large cracks or knotholes, and free from loose material. If roof deck slopes, it shall be properly graded to outlets.

(a) Lay one (1) thickness of sheathing paper or unsaturated felt, weighing not less than five (5) pounds per one hundred (100) square feet, lapping the sheets at least one (1) inch.

(b) Over the entire surface lay two (2) plies of Bonded Tarred Felt, lapping each sheet seventeen (17) inches over preceding one, and nail as often as is necessary to hold in place until remaining felt is laid.

(c) Coat the entire surface uniformly with Bonded Pitch.

(d) Over the entire surface lay two (2) plies of Bonded Tarred Felt, lapping each sheet seventeen (17) inches over preceding one, mopping with Bonded Pitch the full seventeen (17) inches on each sheet so that in no place shall felt touch felt. Such nailing as is necessary shall be done so that all nails will be covered by not less than one (1) ply of felt.

(e) Over the entire surface pour from a dipper a uniform coating of Bonded Pitch into which, while hot, embed not less than four hundred (400) pounds of gravel or three hundred (300) pounds of slag for each one hundred (100) square feet. The gravel or slag shall be from one-quarter (¼) inch to five-eighths (⅝) inch in size, dry and free from dirt.

The felt shall be laid without wrinkles or buckles, not less than one hundred and twenty-five (125) pounds of pitch shall be used for constructing each one hundred (100) square feet of completed roof, and the pitch shall not be heated above four hundred (400) degrees Fahrenheit.

(f) The use of copper or lead for flashings and counterflashings is recommended.

*(g) See Note below.

4-ply Roof for Use over Concrete, 20-year Guarantee Bond—(Applies for flat surfaces or where the grade does not exceed one (1) inch to the foot.)

The roof deck shall be smooth, firm, dry and free from loose material. If roof deck slopes, it shall be properly graded to outlets.

(a) Coat the concrete uniformly with Bonded Pitch.

(b) Over the entire surface lay four (4) plies of Bonded Tarred Felt, lapping each sheet twenty-four and one-half (24½) inches over preceding one, mopping with Bonded Pitch the full twenty-four and one-half (24½) inches on each sheet so that in no place shall felt touch felt.

(c) Over the entire surface pour from a dipper a uniform coating of Bonded Pitch, into which, while hot, embed not less than four hundred (400) pounds of gravel or three hundred (300) pounds of slag for each one hundred (100) square feet. The gravel or slag shall be from one-quarter (¼) inch to five-eighths (⅝) inch in size, dry and free from dirt.

The felt shall be laid without wrinkles or buckles. Not less than two hundred (200) pounds of pitch shall be used for constructing each one hundred (100) square feet of completed roof, and the pitch shall not be heated above four hundred (400) degrees Fahrenheit.

(d) The use of copper or lead for flashings and counterflashings is recommended.

*(g) See Note below.

3-ply Roof for Use over Concrete, 10-year Guarantee Bond—(Applies for flat surfaces or where the grade does not exceed one (1) inch per foot.)

The roof deck shall be smooth, firm, dry and free from loose material. If roof deck slopes, it shall be properly graded to outlets.

(a) Coat the concrete uniformly with Bonded Pitch.

(b) Over the entire surface lay three (3) plies of Bonded Tarred Felt, lapping each sheet twenty-two (22) inches over preceding one, mopping with Bonded Pitch the full twenty-two (22) inches on each sheet so that in no place shall felt touch felt.

(c) Over the entire surface pour from a dipper a uniform coating of Bonded Pitch, into which, while hot, embed not less than four hundred (400) pounds of gravel or three hundred (300) pounds of slag for each one hundred (100) feet. The gravel or slag shall be from one-quarter (¼) inch to five-eighths (⅝) inch in size, dry and free from dirt.

The felt shall be laid without wrinkles or buckles, not less than one hundred and seventy-five (175) pounds of pitch shall be used for constructing each one hundred (100) square feet of completed roof, and the pitch shall not be heated above four hundred (400) degrees Fahrenheit.

(d) The use of copper or lead for flashings and counterflashings is recommended.

*(e) See note.

**Note:* Our twenty-year or ten-year bonded roof shall be applied by a roofing contractor approved by us. He shall furnish our Surety Bond issued by National Surety Company, covering said roof, exclusive of flashings, for a period of ten [10] or twenty [20] years from date of completion. Such bond is obtainable for all roofs, so applied when they are of sufficient size and in such localities where this organization's Inspection Services are available.

THE RUBEROID CO.

Manufacturers of Genuine Ruberoid Weatherproofing Products

NEW YORK, N. Y. CHICAGO, ILL.

OFFICES AND WAREHOUSES IN PRINCIPAL CITIES

Genuine Ruberoid Products

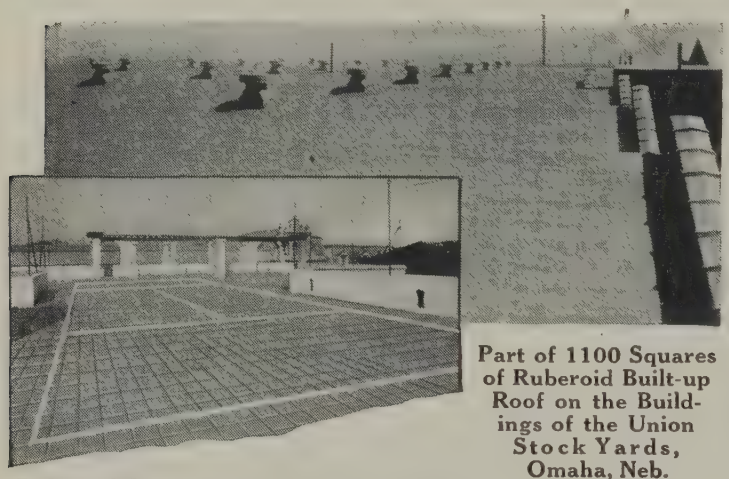
BUILT-UP ROOFING; ASBESTOS SLATES; ASPHALT SHINGLES (Massive Units and Massive Hex-strips, Standard Units, Standard Strips—Hexagonal, Octagonal and Square-tab); WATERPROOFING COMPOUND.

Also, Roll-roofing (Smooth-surfaced and Mineralized); Building Paper; Felts.

Samples and descriptive literature of any Ruberoid product will be gladly sent upon request.

Ruberoid Built-up Roofing

A Ruberoid Built-up Roof consists of one layer of Ruberoid Asphalt Felt and two layers of Ruberoid Cap-sheet bonded together with Ruberoid Roofing Asphalt. Every part is made of time-tested materials.



Part of 1100 Squares of Ruberoid Built-up Roof on the Buildings of the Union Stock Yards, Omaha, Neb.

Ruberoid Roof Showing Special Tile Finish

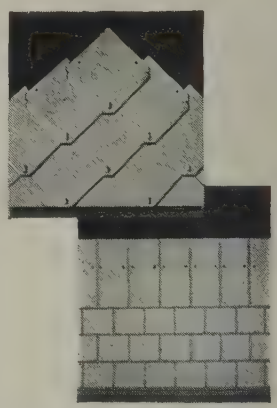
Ruberoid Cap-sheet in itself is a mechanically perfect barrier against the ravages of the weather. The felt, saturant and coating are the same as those used in Ruberoid Roll-roofing which has stood the test of service for more than 30 years. The fact that the asphalt coating is applied by machine in our factories reduces the risk from human error or negligence in application, and permits the use of a tougher, denser and more durable asphalt than could possibly be handled on the job by labor.

The heavy weather coating of Ruberoid Cap-sheet makes it unnecessary to apply a special surfacing. If special finishes are desired, however, Ruberoid Built-up Roofs are adaptable to a wide range of treatments. They may be painted with green or red Ruberoid Roof-coating or finished with slag, gravel, tile, etc.

The bonding material, Ruberoid Roofing Asphalt, is 98.5% pure. It is practically smokeless and free from dirt. Roofers' kettles seldom need cleaning until the job is finished. It heats readily to mopping consistency but will stand unusually high temperatures without flashing or altering in composition.

Specifications—There are several specifications for Ruberoid Built-up Roofs—a quality roof to meet all requirements and every appropriation. *Send for a bound set for your files.*

Ruberoid Asbestos Slates



Ruberoid Asbestos Slates

Ruberoid Asbestos Slates are made from ingredients long recognized for durability—asbestos and cement. They will not warp, crack or decay and are as fire-retardant as any materials known and used for roofing.

They may be obtained in two styles—the Hex-agonal and the American.

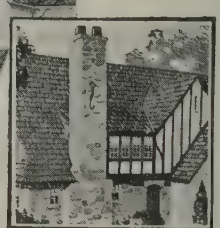
The 12x12-in. Hex-agonal type and the 8x16-in. American style slates may be obtained in colors of Apple-green, Variegated-green, Venetian-red, Variegated-brown, Mottled-brown, Natural-gray and Blue-black.

You have the same choice of colors in the 16x16-in. Hex-agonal slates with the exception of Variegated-brown and Blue-black.

Ruberoid Massive Unit and Massive Hex-strips

In *Genuine* Ruberoid Massive Unit-shingles or Massive Hex-strips, you have a choice of two substantial roof coverings. While widely different in design, they are identical in quality. Each is *40%* thicker than the usual shingle of its type. Each can be secured in a variety of rich non-fading colors and blends. The Hex-strips can also be had in 4-tones, pre-assorted, in the bundles for easy application.

Ruberoid Massive Hex-strips



Ruberoid Massive Units

Either of these extra-thick shingles give pronounced depth of shadow line—the roof massiveness you have heretofore looked for in asphalt shingles, but seldom found. In addition, the extra thickness assures greater protection and longer roof life. Due to labor-saving features, this finished roof costs no more than one laid with ordinary composition shingles.

Ruberoid Waterproofing Compound

Ruberoid Cement Waterproofing, when mixed with portland cement, makes leaky cellars or pits bone dry. Its use in stucco entirely eliminates "hair cracking." It differs from other waterproofing compounds in that it does not delay the set or reduce the strength of the mortar.

SERVICISED PRODUCTS CORPORATION

6051 W. 65th Street
CHICAGO, ILL.

Products

ASPHALT ROOFING; SATURATED FELT; RIDGE STRIP; ASBESTOS CEMENT SHINGLES; SLATE SURFACED SHINGLES; ASBESTOS ROOF CEMENT; ORIENTAL ROOFING.

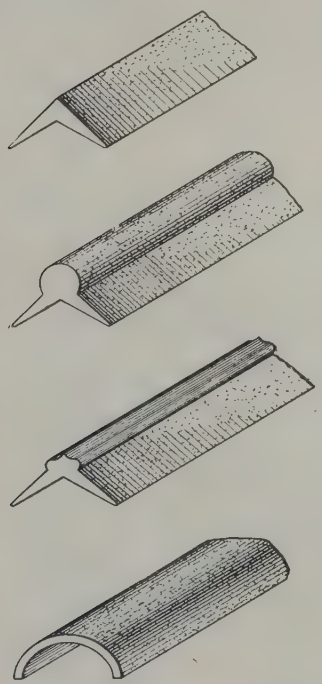
Also manufacturers of Acoustical Board, Baseboard Mouldings and Stair Tread.

For Expansion Joints, see page A131.

For Wall Copings, Flashing Block and Wall Aprons, see page A557.

For Insulation, Roof Cement, Asphalt Paint and Industrial Flooring, see page B1996.

For Sewer Liners, Caulking Belts, Sewer Pipe Compound and Bitupack, see page C2737.



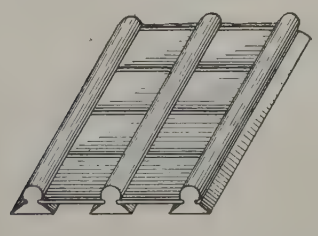
Servicised Ridge Strips

These are fabricated for the purpose of thoroughly waterproofing and covering ridges. Where composition roofing is utilized they are furnished with granular slate material or mineral material to suitably blend with the roof proper. They are better waterproofing; because moisture will not rust them and they will not rot. They are fabricated from bituminous material, linear fiber and mineral matter; formed in various designs, and are free from breakage by hail or shock. They are flexible and tough; can be readily handled and secured to the roof.

Servicised Artificial Slate Strips

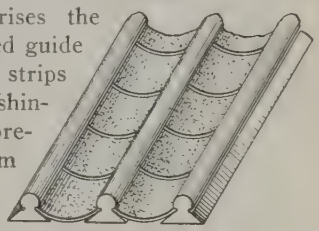
These comprise strip roofing fabricated from bituminous material, slate dust and linear fiber, making a tough, hard and flexible strip resembling slate, and are fabricated with various finishes. They will not blow up in the wind, and are practically fireproof—at least, extremely fire resisting because of a large mineral content. They are finished in various colors, making a highly satisfactory roofing material.

Servicised Asbestos Cement or Slate Roofing



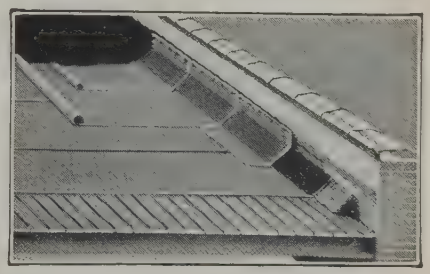
This style of roofing comprises guide strips prepared from bituminous material, linear fiber and mineral matter, finished in various colors, and as guides or anchoring strips for asbestos cement slates, genuine slate and tile materials, it effects economy, is light in weight, resists shock to better advantage and makes a fireproof roof. It is effective in design and economical in laying up.

Servicised Oriental Roofing



This comprises the use of Servicised guide and anchoring strips with cupped shingles. It is prepaired from either composition roofing or asbestos cement mixtures. Shingles may be utilized of various colors, as shown in the illustration, or a single strip may be utilized instead of the shingles for filling the space between the bituminous guides. It forms an effective, economical, Oriental design, beautiful in appearance and economically laid up.

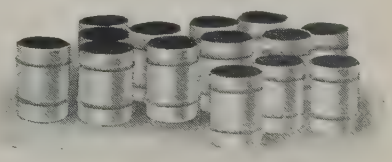
Servicised Saturated Felt



This is particularly adapted for built-up roofing purposes, comprising long linear fiber felt thoroughly saturated, and when employed with Servicised asphalt makes a highly effective built-up roof. The asphalt binder used for covering has a melting point approximating 250° to 260°, with a penetration at freezing approximating 21° to 23° insuring a highly flexible winter-wearing roof covering.

Asphalts ranging from 25° to 35° penetration at 32° F., having high melting point furnished on order.

Servicised Roofing Asphalt



This is adapted for waterproofing purposes, and coating over concrete surfaces. It is an effective asphalt for filling crevices, expansion joints and is a general utility asphalt.

Servicised Plastic Asbestos Cement and Liquid Roof Coating

These are well adapted to troweling and coating over old roofs, the plastic cement being particularly adapted for wall purposes, in making them waterproof and insulating them at the same time. This material is adapted for reservoir walls and old roofs, and for coating over brickwork on boilers, etc. It is a Servicised quality product.

H. F. WATSON COMPANY

Asbestos Built-up Roofings Adaptable to Any Type of Roof

THREE-PLY ASBESTOS BUILT-UP ROOFING over concrete.

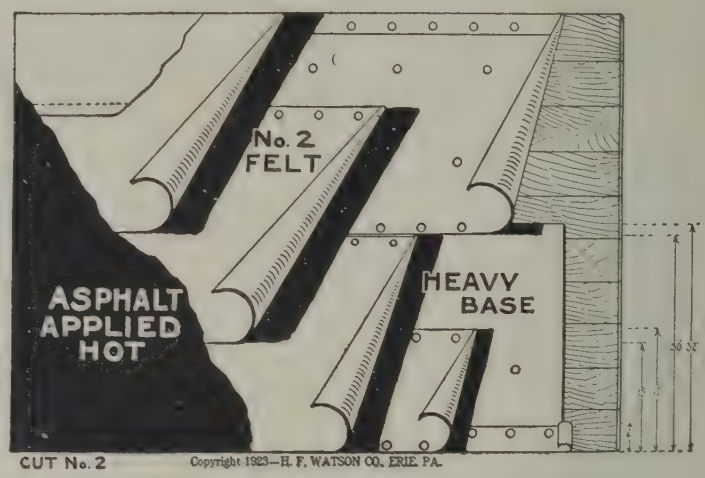
Heavy Base Asbestos Built-up Roofing Over Wood Deck

Abbreviated Specification No. A67-2-W—Roofing to be H. F. WATSON COMPANY'S 3-ply, three-layer Asbestos Built-up Roofing, Specification No. A67-2-W, applied in accordance with manufacturer's complete specifications for wood sheathing surface.

Approximate Materials Required—Approximate quantity of materials per 100 sq. ft. of rock deck surface:

One roll of Watson's No. 67 Asbescoat Asbestos Roofing, 108 sq. ft., 32 in. wide; approximate weight, 65 lb.

Two single plies of Watson's Imperial No. 2 Asbestos Asphalt Saturated Felt, 32 in. wide; approximate weight, 28 to 30 lb.



Watson's Imperial Asphalt, 50 lb.; Watson's Imperial Asphalt, for flood top coat, 20 lb.—total 70 lb.

One pound ⅞-in. small head roofing nails.

One pound flat tin discs.

Three-ply Asbestos Built-up Roofing Over Concrete

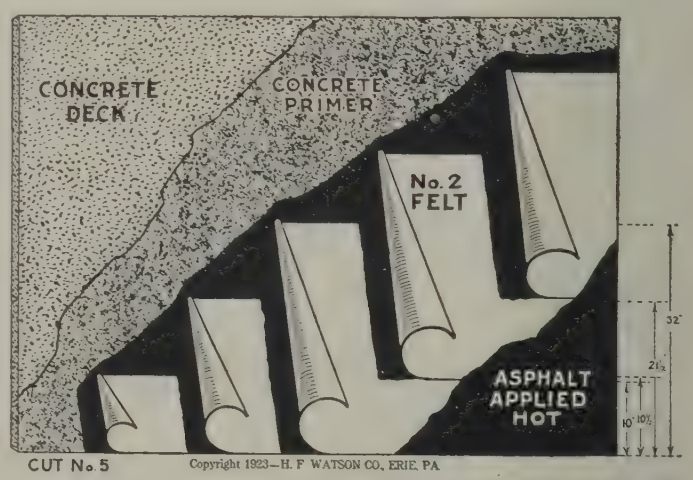
Abbreviated Specification No. A35-2-C—Roofing to be H. F. WATSON COMPANY'S 3-ply, three-layer Asbestos Built-up Roofing, Specification No. A35-2-C, applied in accordance with manufacturer's complete specifications for concrete surface.

Approximate Materials Required—Approximate quantity of materials per 100 sq. ft. of roof deck surface:

Watson's Asphalt Concrete Primer ¾ to 1 gal., 10 lb.

One (1) square Watson's No. 35 Imperial Asbestos Saturated Felt, 32 in. wide; approximate weight 35 lb.

Two single plies of Watson's Imperial No. 2 Asbestos Saturated Felt, 32 in. wide; approximate weight 28 to 30 lb.



Watson's Imperial Asphalt, 85 lb.; Watson's Imperial Asphalt, for flood top coat, 20 lb.—total 105 lb.

Detailed Specifications

Complete portfolio of detailed specifications will be furnished on request—A.I.A. File No. 12b1.

This portfolio includes specifications for various types of built-up asbestos roofs, also built-up asphalt saturated rag felt built-up roofs (smooth surfaced) as well as coal tar pitch, felt and gravel roofs.

H. F. WATSON COMPANY is absolutely unbiased as to type of felt and waterproofing compound used.

We manufacture all three of the most popular types of built-up roof coverings, i.e.: asbestos felt, asphalt felt and tarred felt.

We only recommend the type of roof most suitable for the particular construction.

SAMUEL CABOT, INC.

Stained Shingles

141 Milk Street, BOSTON, MASS.

For Branch Offices and Agencies, see page B2040

Products

CABOT'S CREOSOTE-STAINED SHINGLES.

For Building Insulation, see page B1625; for Paints, Stains and Wood Preservatives, see pages B2040-2041.

Cabot's Creosote-stained Shingles

Description—Grade A, U. S. Dept. of Commerce Standard, red cedar shingles, ready-stained with Cabot's Creosote Shingle Stains.

Sound live wood; uniform thickness; edge grain; even butts; do not warp or curl. Thoroughly preserved by complete immersion in Cabot's Creosote. Sold in original bundles, as packed at the mill, guaranteed full count.

The warmest, the most economical and the most picturesque house finish.

Standard Colors—***Weathering Browns, Light and Dark Bungalow Browns, Bark Brown, Warm Brown; Light and Dark Tile Reds, Maroons, etc.***—A complete range of these handsome and durable colors for roofs and walls.

Light, Dark and Medium Moss Greens—Our moss greens have a richness and depth of color such as can only be produced by the strongest and purest pigments.

Insulated with Cabot's Quilt; Exterior Walls, Cabot's Stained Shingles; Exterior Trim Finish with Cabot's Old Virginia White Collopakes

JOHNSON & CARLSON, Youngstown, Ohio, General Contractors

Weathered Grays—Our grays give the true natural seashore gray tones.

White Shingles—Cabot's Shingles are also furnished ready-stained with No. 1166 White Primer, to be finished after the shingles are laid, either with (1) a brush coat of No. 1166, (2) one or two brush coats of Cabot's Old Virginia White or (3) one or two coats of Cabot's Double-White. See page B2041 for description of these materials.

Blended Roofs—All color combinations are blended in the bundle so they can be laid without blending on the job.

Anteaks and Irregular Butts—"Royals" treated by our patented machines to give aged and antique effects, and with irregular butts, are sold under our trade-mark "Anteaks." Irregular butts are also furnished in regular type shingles, all sizes, at slight extra cost.

Samples

Samples of standard colors sent on request.

Cabot's Creosote Stained Shingles

Sizes

24-in. "Royals," 18-in. "Perfections" and 16-in. "XXXXX," the highest grade shingles made, are used exclusively for Cabot's Creosote-stained Shingles.

"Royals" for walls, laid with 10 to 12-in. exposure, are much more artistic than dressed siding, much warmer and the cost is actually lower. "Perfections" and "XXXXX" are the standard regular sized shingles for walls and roofs.

Deliveries

Prompt deliveries from staining plants in Boston, Chicago, Baltimore, Philadelphia, Newark, New Rochelle, Columbus, Cleveland, Los Angeles, Seattle, San Francisco, etc., and from warehouses at all central points.

COVERING CAPACITY OF CABOT'S CREOSOTED SHINGLES, SQUARE FEET PER SQUARE AT VARIOUS EXPOSURES—STANDARD GRADES—RANDOM WIDTHS

	Approx. weights per square, lb.	4-in. exp.	4½-in. exp.	5-in. exp.	5½-in. exp.	6-in. exp.	6½-in. exp.	7-in. exp.	7½-in. exp.	8-in. exp.	8½-in. exp.	9-in. exp.	10-in. exp.	11-in. exp.	12-in. exp.

TRADE-MARK
(Reg. U. S. Pat. Off.)

Leading Lumber Dealers Everywhere Carry Stock

Creo-Dipt Stained Shingles are carried in stock by lumber dealers in all parts of the United States and Canada. Shipments are made from our plants at North Tonawanda, N. Y., Minneapolis, Minn., Kansas City, Mo., and Vancouver, B. C.

Write for New Unusual Roof Treatments

A Service Department is maintained to co-operate with architects, contractors and home builders. We go over plans carefully, giving the approximate quantity of Creo-Dipt Shingles required. This department also is continually developing new and unusual roof treatments. Write us for suggestions. There is a trained Creo-Dipt salesman in every locality who will welcome the opportunity to serve you. Look for the name *"Creo-Dipt"* in your phone book.

Superiority of Creo-Dipt Stained Shingles

Genuine Creo-Dipt Stained Shingles are made only from selected cedar with the grain of the wood running 100% straight from top to bottom of each shingle. This means that they will lay flat and will not split. They come stained, bundled, and ready to lay in grades, 16″, 18″ and 24″ long.

Genuine Creo-Dipts are now preserved by a patented exclusive Creo-Dipt process. These new process Creo-Dipts carry a 35% heavier coating of stain than we could secure by ordinary hand-dipping. They resist weather with the absolute minimum of upkeep.

Creo-Dipt Stain is made from the strongest pigments, ground to the finest possible condition in linseed oil in our own mills. Excepting Dixie White, Creo-Dipt Shingles do not require brushcoating after they are on the building. (See the paragraph on Dixie White.)

Stain for Retouching, Patching and Cutting

With every order of Creo-Dipt Shingles, a small can of Creo-Dipt Stain is shipped for retouching the shingles which have to be trimmed or cut to fit flashing, valleys and other conditions.

On Old Homes, Too

Many architects are now rebeautifying old homes with Creo-Dipts laid right over the old siding and roof. Write for photographs.

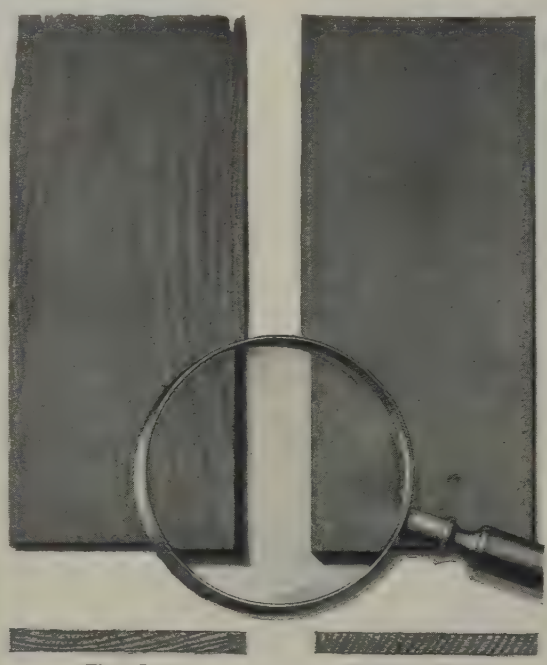
Sizes and Styles of Creo-Dipt Stained Shingles

Note: In specifying, give the name indicating the thickness in addition to the length of the shingles.

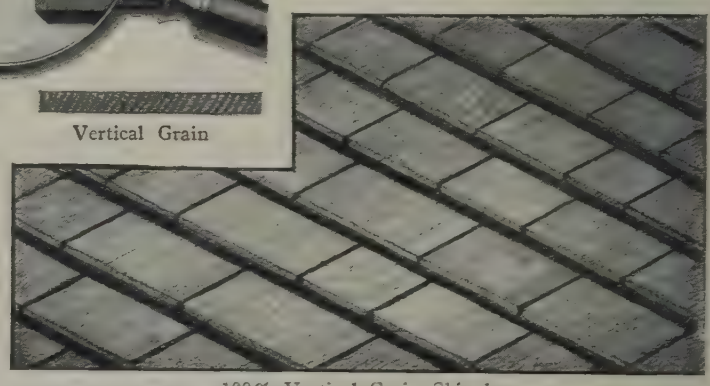
Thatched Effect—Special Creo-Dipt Stained Shingles are furnished for thatch roofs ready for application. Complete instructions and details will be supplied to architects and builders.

Graduated Exposure—The best effect is secured by starting at the eaves with the large Creo-Dipt Aristocrat at wide exposure, working through thinner grades at decreasing exposures up to the ridge.

Blended Color Treatment—Unusual artistic results can be obtained by using several shades of the same color starting with the darkest shade at the eaves, working to the lightest shade at the ridge.



Flat Grain Shingle
After a few years' service it curls, splits and rots



100% Vertical Grain Shingles
Sound and free from imperfections, they will not rot, split nor curl

Comparison of Flat Grain and Vertical Grain Shingles

Continued on next page

Variegated Effects—Creo-Dipt Shingles can be furnished packed promiscuously in each bundle in any proportion of the various shades which you select.

Dixie White—Creo-Dipt Dixie White is a soft velvety white shingle stain. Two brushcoats give the desired Colonial White effect to the Creo-Dipt Stained Shingles after they are laid—the shingles having been creosoted and stained at our factories with a special preparation, color No. 207, which acts as a filler, primer, binder and preservative. Special samples on request.

Creo-Dipt Aristocrats—24 inches long; random widths; 1 inch in thickness at the thick end.

Creo-Dipt Pilgrims—(Hand split) 22 to 24 inches long; random widths; ½ to 1¼ inches in thickness at the thick end.

Creo-Dipt Ambassadors—(Shakes) 24 inches long; random widths; ½ inch thick; corrugated face to give effect of old hand-split shingles.

Creo-Dipt Royals—24 inches long; random widths; ½ inch in thickness at the thick end.

Creo-Dipt Perfections—18 inches long; random widths; 5 shingles will measure 2¼ inches in thickness at the thick end.

Creo-Dipt Eurekas—18 inches long; random widths; 5 shingles will measure 2 inches in thickness at the thick end.

Creo-Dipt XXXXX—16 inches long; random widths; 5 shingles will measure 2 inches in thickness at the thick end.

Creo-Dipt XXX—16 inches long; random widths; 6 shingles will measure 2 inches in thickness at the thick end.

Covering Capacity of Creo-Dipt Stained Shingles

All shingles are sold on the basis of the square (100 square feet).

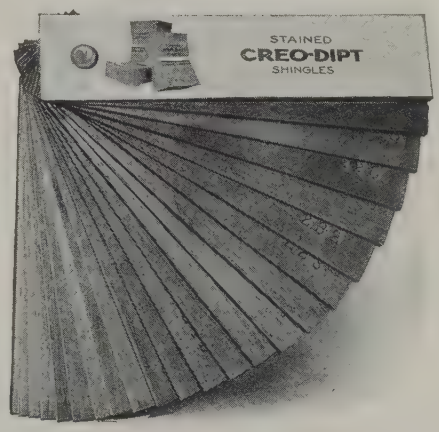
The table below gives the covering capacity of a square of shingles at various exposures:

Name	Length in.	Exposure to the weather, in.									
		5	5½	6	6½	7	7½	8	10	10½	11
Aristocrats*	24	....	....	....	....	....	75	....	100	105	110
Pilgrims*		....	....	....	....	70	75	....	100	105	110
Ambassadors*		....	....	....	....	....	75	....	100	105	110
Royals*		....	....	....	....	....	75	....	100	105	110
Perfections	18	....	100	111	120	129	138	148	....	....	....
Eurekas		....	100	111	120	129	138	148	....	....	....
XXXXX	16	100	110	120	130	140	....	....	....	....	....
XXX		100	110	120	130	140	....	....	....	....	....

*These shingles usually laid 10 inches to the weather on sidewalls and 7 or 7½ inches on roofs. Pilgrims, being hand-split, require a water-tight sub-roof.

Shades

Creo-Dipt Stained Shingles are manufactured in any color or combination of colors. A color pad, showing a wide choice of shades, will be sent on request. We will make special shades or submit samples without charge.



Creo-Dipt Color Pad

Do Not Be Mis-led

Do not be mis-led into thinking that any stained shingles are Creo-Dipt. The trade-mark, "Creo-Dipt" on every bundle protects you and your client. The quality of Creo-Dipt Shingles has no substitute. Be sure to get real Creo-Dipt.

THE EDHAM COMPANY, INC.

Sole Manufacturers of Edham Kolored Shingles

GENERAL OFFICE
MINNESOTA TRANSFER, ST. PAUL, MINN.
MILL: VANCOUVER, B. C.
FACTORIES: MINNESOTA TRANSFER, ST. PAUL, MINN., TORONTO, ONT., and VANCOUVER, B. C.
SALES OFFICES IN ALL PRINCIPAL CITIES

Products

Sole manufacturers of EDHAM KOLORED SHINGLES for roof and sidewall covering, made in 31 colors, in addition to any variegated or mixed color effect. Special colors to order, as specified.

EDHAM KOLORED THATCH SHINGLES, to produce thatched effect.

Edham Kolored Shingles

They are manufactured from red cedar, which wood contains a natural preservative, and attains its greatest degree of perfection in the forests of the Canadian Province of British Columbia, owing to soil properties, rain fall and drainage peculiar to that region. Edham Kolored Shingles are cut from these forests and manufactured in one of British Columbia's most modern mills, located in Vancouver, B. C. They are 100% clear and edge grain—they cannot warp, cup or curl.

Following their manufacture they are placed in slow drying kilns that remove all excess moisture and make them receptive to color and oil without affecting the strength or lasting qualities of the wood. They are then distributed to our staining operations, where their treatment is completed.

A roof is no stronger than its weakest shingle. The illustrations we use here show the difference between the edge grain shingle and the flat grain shingle.

Edham KOLORED *Shingles*

The stain used in the treatment of Edham Kolored Shingles is manufactured from the raw color to the finished product in our own mills. The color used is made, in all cases, from 100% pure earth pigments ground with linseed oil in stone mills until they are of liquid smoothness. The pigments are then mixed in a vehicle of linseed oil containing sufficient creosote and other oils to insure maximum penetration.

The process of treatment adopted is what is referred to as the *hand dipping* process—the bundles, after the shingles have been thoroughly dried and are free from moisture, are broken open and each shingle treated separately and individually. Then, after the color has dried and thoroughly set, the shingles are repacked into bundles, tagged and piled on trucks ready for loading. This treatment insures unusually permanent colors which will not rub off, check or peel.

Edham Kolored Shingles have demonstrated that they will last two or three times as long as shingles that have been brush coated, painted or treated in any other manner on the job where they have first been exposed to the weather and dampness.

Samples submitted without charge. Color pads and miniature panels showing the different variegated effects obtainable will be sent to architects upon request.

A Flat Grain Shingle—It Will Warp

Note the uneven grain of the wood, which indicates uneven stresses and strains that will cause warping, cupping and curling

Edham Kolored Edge-grain Shingles Will Not Warp

Note the parallel and vertical grain of this Edham Edge-grain shingle. It positively cannot warp, cup or curl

Continued on next page

Edham Kolored Variegated Effects—The variegated effects are obtained by using two or more shades of Edham Kolored Shingles. The shingles are packed promiscuously in the bundles ready for the workmen to lay. Many artistic effects are thus achieved which would be impossible to secure in any other way.

They Save Labor—A considerable saving in labor can be effected by the use of Edham Kolored Shingles, as compared with shingles stained on the job. The bundles, in both straight colors and in variegations of two or more shades, are packed ready to lay, and can be carried in pack to any position required, in this way greatly reducing the cost of handling.

They save the labor of dipping and of additional brush-coating which is often necessary for shingles stained under other conditions.

Adaptable to Many Styles of Architecture—Architects know that the beauty of a house is largely dependent upon certain essentials of good design—rhythm and repose; proportion and scale; texture and color. One architect summed up the possibilities of Edham Kolored Shingles in this respect, in the following manner:

"The great variety of color schemes possible with Edham Kolored Shingles, combined with the harmonious blending of each shingle and surface in general, give, on wall or roof, life and interest and the essentially distinctive color values."

Sizes and Covering Capacity—Edham Kolored Shingles are procurable in every grade, thickness and length manufactured. Standard grades and colors are carried in lumber yards in most cities.

Where we have no local representative, we will be glad to arrange for delivery of material upon request from architect.

Sizes—***Edham Kolored Supremes***—24 in. long; random widths; 1 in. thick at the butt.

Edham Kolored Process Shakes—24 in. long; random widths; $\frac{9}{16}$ and 1 in. thick at the butt. Sawn to produce the hand split effect.

Edham Kolored Royals—24 in. long; random widths; ½ in. thick at the butt.

Edham Kolored Perfections—18 in. long; random widths; 5 shingles will measure 2¼ in. at butt.

Edham Kolored Eurekas—18 in. long; random widths; 5 shingles will measure 2 in. at butt.

Edham Kolored XXXXX—Clears—16 in. long; random widths; 5 shingles will measure 2 in. at the butt.

Edham Kolored XXX—Clears—16 in. long; random widths; 6 shingles will measure 2 in. at butt.

Edham Kolored Thatch Shingles—16 in. long; random widths; 5 shingles will measure 2 in. at the butt; sawn in patterns to specifications.

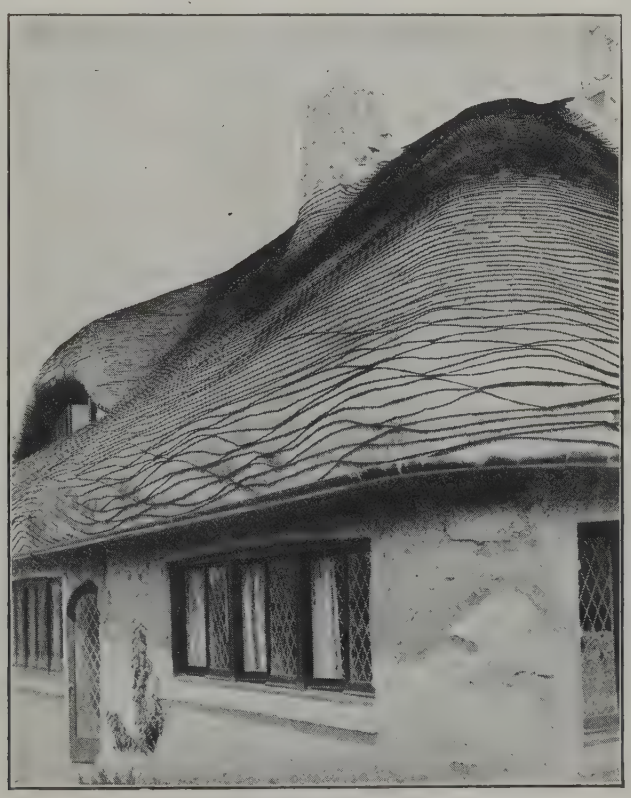
Covering Capacity—All shingles are sold on the basis of the square (100 sq. ft.). The table following gives the covering capacities in square feet of the square of shingles on various exposures:

Name	Length, in.	*Exposure to weather, in.									
		5	5½	6	6½	7	7½	8	10	10½	11
Supremes Royals Process Shakes	24	...	...	...	...	...	75	...	100	105	110
Perfections Eurekas	18	...	100	111	120	129	138	148	...	...	...
XXXXX Clears XXX Clears	16	100	110	120	130	140	...	...	...	...	...

*In choosing amount of exposure, due consideration should be given to location, i.e., steep roofs, rather flat roofs, sidewalls, etc.
24-in. Supremes, 5 $\frac{8}{8}$ course bundles constitute one square.
24-in. Shingles, 3 $\frac{13}{14}$ course bundles constitute one square.
18-in. Shingles, 4 $\frac{18}{18}$ course bundles constitute one square.
16-in. Shingles, 4 $\frac{20}{20}$ course bundles constitute one square.

Edham Kolored 24-in. Shingles for Sidewalls

Many architects have specified the Edham Kolored 24-in. Shingles for sidewalls, during the past year. They desire to give the effect of the old-fashioned shingle of Colonial days, and these shingles are especially



Thatch Roof of Edham Kolored Shingles

Continued on next page

applicable to the Colonial style of architecture. Shingles are generally laid 10 in. to the weather on sidewalls and 7½ in. on the roof.

Prompt Shipment

Edham Kolored Shingles are shipped promptly to all parts of the United States and Canada, from our factories at Minnesota Transfer, St. Paul, Minn., Toronto, Ont., and Vancouver, B. C.

Architectural Service

We are always glad to send architects, on request, specific information, samples and special literature. Edham Kolored Shingles are nationally advertised for the purpose of creating consumer acceptance. All Edham Kolored Shingle advertising recommends that the homebuilder employ the services of an architect.

Specifications for Roofs and Sidewalls

Shingles—All roof and sidewall surfaces shall be covered with Edham Kolored Shingles (here specify grade and color), as manufactured by The Edham Company, Inc., Minnesota Transfer, St. Paul, Minn., and bearing the Edham Kolored red tag and Edham Kolored bandstick. Shingles shall be laid with well broken joints with....in. exposures to weather.

Nails—Shingles shall be nailed with (here specify type of nails required); each shingle shall be nailed with at least two nails under cover of the following course.

Note: We recommend zinc-clad, pure zinc or copper nails.

Red Cedar Attains This Marvelous Degree of Perfection in British Columbia As a Result of Soil Properties, Rainfall and Drainage

We own and operate our own mills in British Columbia

Standard Specifications for Edham Kolored Shingles Laid Irregularly for Thatch Effects

Shingles—All roof surfaces to be covered with Edham Kolored bent or straight shingles manufactured by The Edham Company, Inc., of Minnesota Transfer, St. Paul, Minn., in the following grades and colors (here clearly specify grades and colors required).

Preparation of Roof—All surfaces and angles of the roof timbers, including eaves, gables, hips and ridges, valleys, etc., to be furred and blocked or shaped to present rounded, cambered or hollowed surfaces, to carry out the intention of the drawings, and to produce the thatch effect in the finished roofs.

Nails—All shingles to be nailed with (specify hot-dipt zinc-clad, pure copper or zinc nails), using the 3d ordinary 1¼-in. nail for bent shingles, and 3d fine for flat surfaces, and an occasional 6d nail at quick bends.

Note: On high class work, the architect is recommended to specify copper nails; and in specifications for sheet metal work, is urged to specify copper flashings and eaves troughs, etc.

Working Specifications—The standard working specifications or recommendations and the standard illustrative details of The Edham Company, Inc., are to be read as a part of this specification.

(Copies of the standard working specifications for Edham Kolored Thatch Roofs may be had on request to The Edham Company, Inc., Minnesota Transfer, St. Paul, Minn.)

TRADE-MARK

Elhide Hand-Split British Columbia Red Cedar Shingles

These shingles are remarkable for beauty of texture and rough simplicity. Their large size and heavy butts combine to make a most charming effect for either siding or roofing.

We split these shingles by hand in the virgin forests of British Columbia from the finest straight-grain red cedar. After being split they are sawed diagonally so as to make a tapered shingle, hand-split on the upper side and smooth on the lower side.

We call special attention to the possibilities of these shingles for graduated roofs, running from 2-in. butts at the eaves to ½-in. butts at the ridge with very beautiful results.

Sizes—25 in. long, random widths 4 to 12 in. Three thicknesses: ½, ¾ and 1-in. butts. Thicker butts up to 2 in. to order for graduated roofs.

Specifications—Cover roofs and sides with Elhide Hand-Split British Columbia Red Cedar Shingles (following with thickness of butts and exposure to weather desired) as manufactured by The Elhide Company, Cambridge, Mass. (Full specifications upon request.)

Installations—List of buildings covered with Elhide Hand-Split Shingles gladly furnished.

Samples and Layouts—Send for a sample shingle. It will show you better than any illustration the beauty of its texture. Layouts for graduated roofs also furnished.

And Retail Lumber Dealers Throughout the United States

Fitite Colonial Shakes

Description—Fitite Colonial Shakes are manufactured from select Western Red Cedar, all clear, all vertical grain, no defects and free from sap.

Three-quarters of the length of the shake is unevenly grooved or processed, leaving one-quarter of the thin or upper end and all of the underside of the shingle smooth sawn, as in the ordinary shingle. This Fitite feature insures a tight fit where shingles overlap.

It is possible to obtain from Fitite Colonial Shakes all the beauty, texture and graceful lines obtained from the old hand-split shake. Yet they are laid as easily as ordinary shingles.

Protected by patents and trade-mark in the United States and Canada.

An Example of the Beautiful Effects Possible with Fitite Colonial Shakes

J. Charles Stanley, Seattle, Wash., Architect

Fitite Tile—Fitite Tile is manufactured of select Western Red Cedar, processed and grooved three-quarters of its length, to give tile effect. Top quarter and back of shingle left smooth—the Fitite feature.

Sizes and Styles—

Fitite Sovereigns—Made from stock 1 in. thick, 24 in. long. Packed 6 bundles per square for 10-in. weather exposure. 7/7 course bundles. Shipping weight, 300 lb.

Fitite Regents—Made from stock ¾ in. thick and 24 in. long. Packed 4 bundles per square for 10-in. weather exposure. 10/10 course bundles. Shipping weight, 225 lb.

Fitite Sultans—Made from stock $\frac{9}{16}$ in. thick by 24 in. long. Packed 3 bundles per square for 10-in. weather exposure, 13/14 pack. Shipping weight, 160 lb.

Fitite Majors—Made from stock ½ in. thick by 24 in. long. Packed 3 bundles per square for 10-in. weather exposure, 13/14 pack. Shipping weight, 145 lb.

Fitite Juniors—Made from stock 9/20 in. thick and 18 in. long. Random widths. Packed 3 bundles per square for 7½-in. weather exposure, 18/18 pack. Shipping weight, 120 lb.

Fitite Shingle Tile—$\frac{9}{16}$ in. thick, 6 in. wide and 24 in. long. To be exposed 7½ in. to weather and laid like shingle. Packed 84 pieces to bundle, 4 bundles for each square covered. Shipping weight, 225 lb.

Fitite Senior Tile—1 in. thick, 6 in. wide and 24 in. long. Weather exposure, 10 in. Laid like shingle. Packed 42 pieces in bundle, 6 bundles for each square covered. Shipping weight, 300 lb.

Methods of Laying Fitite Roofs

Fitite Shakes should project 1 to 1½ in. at the edges and ¾ to 1 in. over gable edge. They should be spaced ⅛ in. apart. For roof break all joints 1½-in. sidelap. Breaks or joints should not be over the preceding breaks for at least three laps or courses. Nails used to be either zinc, galvanized coated or copper.

Note: Use either Fitite Sovereigns or Regents for Methods A and B.

Method "A," Single Course—Lay course double exposure 7½ to 9 in., use 4d nails, two to each shake, 8 to 10 in. from butt, sheathing solid.

Method "B," Double Course—First course triple, others double, maximum exposure 15 in., sheathing solid. Undercourse shingles to be ½x24 in. No. 1 Royals, nailed with 3½d nails, and outer course nailed with 4d nails, two to each shake, set about 16 in. from butt.

Note: Use either Fitite Sultans or Fitite Majors in Methods E, F, or G.

Method "E," Single Course—First course double, maximum exposure 7½ in. to weather. Use 3½d nails, two to each shake, 8 to 10 in. from butt. Sheathing solid or 7½-in. centers. 7½-in. exposure requires 4 bundles per square.

Method "F," Double Course—Lay first course triple, others double, maximum exposure 11 in., sheathing solid. Nail undercourse shingles with 3½d nails, top course with 4d nails, two to each shake, set 12 in. from butt. Undercourse to be ½x24-in. shingles. 2¾ bundles of shakes and 2¾ Royals required per square for 11-in. exposure.

Method "G," Triple Course—Maximum exposure 17 in. First courses to be first grade ½x24-in. shingles, nailed with 4d nails, two to each shingle, set 15 in. from butt. Outside course to be Fitite Shakes, nailed with two 6d galvanized copper bearing or solid copper nails, set 3 to 5 in. from butt and 1 in. from edge. 3½ bundles of shingles and 1.8 bundles of shakes required per square, 17-in. exposure.

In each method the weather exposure and the quantity of shingles needed are governed by the style of Fitite Shake used.

Fitite Colonial Shake

Methods of Laying Fitite Walls

Note: Use either Fitite Sultans or Fitite Majors in Methods H and M.

Method "H," Single Course—Lay first course double, single thereafter, maximum exposure 11 in., two 3½d nails to each shake, set 12 in. from butts. 2¾ bundles required per square for 11-in. exposure.

Method "M," Double Course—Maximum exposure 17 in. First course shingles to be nailed with 4d nails, two to each shingle. Outside course to be nailed with two 6d galvanized casing nails set 3 in. from butt and 1 in. from edge. Solid sheathing applied over good grade of building paper will make extra warm when wanted. 1.8 bundles each grade of shakes or shingles required per square for 17-in. exposure.

Service to Architects

The Fitite Colonial Shake Company is prepared to give technical data and further specifications for laying upon request.

DIMENSIONS OF FITITE COLONIAL SHAKES

JAMES LUMBER COMPANY

"Blue Jay" Hand Made Cypress Shingles

88 Broad Street
BOSTON, MASS.

"Blue Jay" Cypress Shingles

"Blue Jay" Shingles are hand split—riven with the grain—which preserves all the wonderful weather-resisting qualities of heartwood cypress, "The Wood Eternal." No single generation lives long enough to renew a hand split and shaved cypress roof that has been properly laid.

"Blue Jay" Cypress Shingles are made by exactly the same methods as were followed by the pioneers of South Carolina and their slaves, who as far back as 1640 did a thriving business in this line. Some of the roofs on which they were laid in those days are still in service today—weatherproof after nearly three centuries of exposure.

Today, descendants of those same slaves, working in the same southern swamps, are felling selected trees, cutting bolts and with frow, maul and drawshave, are making "Blue Jay" Shingles for American homes.

When split and tapered, they are piled loosely and left to season and to weather in the sun and air. Therefore, as delivered to the job, "Blue Jay" Shingles are already semiweathered.

Further exposure to inland air deepens their wonderful soft brown tones, while along the shore they weather to a silver gray.

To the Colonial type of house, "Blue Jay" Shingles add years—both in appearance and weatherproofness. For other types, or wherever desired, they may be painted or stained.

All "Blue Jay" Shingles are carefully selected, graded and fully guaranteed.

Sizes—"Blue Jay" Cypress Shingles are made in the two sizes most favored in Colonial days and still considered best:

7x24 in., with 5/8-in. butts and 1/8-in. tops
6x20 in., with 1/2-in. butts and 1/8-in. tops
Samples gladly supplied on request.

Laying—For roofing, the larger size should be laid 7 in. to the weather, and the smaller size 6 in. to the weather. For sidewalls, the 7-in. shingles may be placed 8 or even 9 in. to the weather. The 6-in. size should be laid 7 or 8 in. to the weather.

Nailing—Specify copper (1¾ to 2¼ in. in length), "yellow metal" or old-fashioned dipped galvanized nails, 5d or 6d according to exposure. The less the amount of shingle exposed to weather the longer the nail should be. On sidewalls, 4d nails may be used. Prices on nails will be quoted if desired.

Staining—Although "Blue Jay" Shingles never have that "new," "raw" look and never actually require staining—either for appearance or preservative purposes—they may be whitened or colored with paint or any standard stain.

Prices—Prices for "Blue Jay" Shingles loaded on cars Boston, Mass., shipped from stock, are as shown below. Freight and carting additional. Freight to most New England stations will not exceed $1.00 per square; carting not exceeding 10 miles about $1.00 per square.

6x20-in. Shingles*

Laid	6 in. to weather	$17.00 per 100 sq. ft.	covered
Laid	7 in. to weather	14.50 per 100 sq. ft.	covered
Laid	8 in. to weather	13.00 per 100 sq. ft.	covered

7x24-in. Shingles*

Laid	7 in. to weather	$20.75 per 100 sq. ft.	covered
Laid	8 in. to weather	18.00 per 100 sq. ft.	covered
Laid	9 in. to weather	16.00 per 100 sq. ft.	covered
Laid	**10 in. to weather**	**14.50 per 100 sq. ft.**	**covered**

*For recommended exposures, see paragraph "Laying," above.

Prices for points outside of New England furnished upon request, based on shipments made from nearest available stock.

Specifying—To obtain the genuine article specify as follows: "For roof and sidewalls use genuine cypress, clear, all heart, hand made, split and shaved shingles, "Blue Jay" Brand, supplied by JAMES LUMBER COMPANY, 88 Broad Street, Boston, Mass.

Sidewalls and Roof of "Blue Jay" Hand Made Cypress Shingles—Residence of Thomas Sanders, Topsfield, Mass.

WEATHERBEST STAINED SHINGLE COMPANY, INC.

Manufacturers of Red Cedar Hand Dipped Stained Shingles

NORTH TONAWANDA, N. Y.

FACTORIES: NORTH TONAWANDA, N. Y. AND ST. PAUL, MINN.

Products

WEATHERBEST EDGE GRAIN RED CEDAR STAINED SHINGLES for roofs and sidewalls; WEATHERBEST 24-IN. COLONIAL WHITE STAINED SHINGLES; WEATHERBEST THATCHED EFFECT STAINED SHINGLES; WEATHERBEST "DOUBL-THIK" STAINED SHINGLES; WEATHERBEST OLD COLONY HAND RIVED SHAKES.

Used on Roofs and Sidewalls

WEATHERBEST stained shingles are used on sidewalls as well as roofs and are adaptable to practically every type and style of building—from the small cottage or bungalow to the stately country home. The soft, semi-transparent colors add much to the attractiveness of a home. WEATHERBEST stain emphasizes the grain in the wood just enough so that the flat tone of a painted surface is absent. WEATHERBEST stained shingle sidewalls cost 30% to 50% less than walls of bevel or Colonial siding and will last fully as long. A WEATHERBEST stained shingle roof laid with zinc coated nails will give perfect service for over 50 years.

Reliability

There is sixteen years' experience behind this rigorous policy: *"Not to cheapen materials or process to meet price competition."*

Each bundle of WEATHERBEST stained shingles carries the green WEATHERBEST label and is our guarantee of perfect material and lasting colors.

Quality of Weatherbest Shingles

Only the finest grade of all clear, strictly 100% edge (vertical) grain, red cedar is used in the manufacture of WEATHERBEST stained shingles. Every shingle is perfect from tip to butt. Extreme care is exercised that all shingles are entirely free from any trace of dampness before being subjected to the WEATHERBEST process of staining.

Quality of Weatherbest Stain

WEATHERBEST stain consists of the strongest color pigments obtainable, high grade wood creosote preservatives and pure linseed oil as binder. These ingredients are mixed in our factories by our color and oil experts in the correct proportion to insure colors that are rich and soft in tone, and, above all—durable.

Weatherbest Staining Process

All shingles are unbundled at our factories and stained separately—not bundle-dipt as is the case with many other stained shingles. The WEATHERBEST process treats each shingle thoroughly and perfectly. After staining, the shingles are dried, inspected and any imperfect shingles replaced with good ones, then rebundled.

Always Lie Flat

Because they are 100% edge (vertical) grain and because of the WEATHERBEST preserving solution, WEATHERBEST stained shingles always lie flat. They will not check, crack or curl during their many years of service. The edge grain is also, to a large degree, responsible for the exceptionally long life of WEATHERBEST colors, as edge grain allows the color pigments to enter deep into the pores of the wood.

Weatherbest Variegated Color Roofs

WEATHERBEST stained shingles in several shades of one color, or different colors, may be used on roofs with decidedly pleasing results. For this purpose, there are standard WEATHERBEST variegated color schemes in browns, greens, reds, grays, etc., worked out to just the correct proportion of colors. No extra labor is required to lay, as the different colored shingles are mixed and then re-bundled at our factories so that the carpenter lays them as received. Ask for panels in miniature showing variegated colors.

Sizes, Colors and Covering Capacity

WEATHERBEST stained shingles are furnished in following sizes:

12 in.	WEATHERBEST XXXXX	5 butts to 2 in.
16 in.	WEATHERBEST XXXXX	5 butts to 2 in.
16 in.	WEATHERBEST XXX	6 butts to 2 in.
16 in.	WEATHERBEST "Doubl-Thik"	5 butts to 3½ in.
18 in.	WEATHERBEST Eurekas	5 butts to 2 in.
18 in.	WEATHERBEST Perfections	5 butts to 2¼ in.
24 in.	WEATHERBEST No. 1 Royals	½ in. butts
24 in.	WEATHERBEST "Doubl-Thik"	1-in. butts

Note: See next page for sizes of Weatherbest Old Colony Shakes.

The standard WEATHERBEST colors consist of 20 different shades of greens, browns, reds and grays. WEATHERBEST stained shingles are also furnished in a color combination similar to weathered straw for WEATHERBEST thatched effect roofs, and in many variegated color schemes. Special colors are also furnished without extra charge. Color samples on request.

NUMBER OF SQUARE FEET A SQUARE OF WEATHERBEST STAINED SHINGLES WILL COVER WHEN LAID AT VARIOUS EXPOSURES

Continued on next page

Weatherbest Old Colony Hand Rived Shakes

To those desiring the true beauty of the oldtime shake we unhesitatingly recommend WEATHERBEST Old Colony genuine hand rived tapered red cedar shakes.

These shakes are manufactured in 25, 31 and 37-in. lengths. They are of random width and vary in thickness as did those split by the oldtime settlers and provide an ideal roof and sidewall covering where "something different" is desired.

We have prepared a brochure showing details of WEATHERBEST Old Colony shakes as used on roofs and sidewalls as well as pictures of houses covered with WEATHERBEST hand rived shakes. Send for literature descriptive of shakes and request samples.

24-in. Weatherbest Colonial White Shingles

The large 24-in. heavy butt, WEATHERBEST Colonial white stained shingles are used extensively on sidewalls for the wide course effect. The wide exposures possible (10 in. and 11½ in.), and the pure, non-glaring white of WEATHERBEST Colonial white stain combine to make a sidewall that is far more attractive than the monotonous white of a painted clapboard siding. WEATHERBEST Colonial white stained shingles are first treated at our factories with a filler coat of our No. 500 white preserving stain. After they are laid on the sidewalls, the shingles should then receive two light brush coats of WEATHERBEST Colonial white stain to produce the true whitewashed effect.

Weatherbest Standard Specifications

To guard against substitution of inferior material, we advise incorporating the following in specifications:

Shingles: To be (insert size and color) WEATHERBEST, all clear, all edge grain stained shingles, as manufactured by WEATHERBEST STAINED SHINGLE COMPANY, INC., of North Tonawanda, N. Y., and St. Paul, Minn.

Weatherbest Thatched Straw Effect Roofs

Combining attractiveness with long life, a WEATHERBEST thatched effect stained shingle roof offers the means of a radical but artistic departure from the conventional sharp angle roof.

WEATHERBEST thatched stained shingles are furnished ready for application. They come bent with the grain (lengthwise) to a 20-in. radius for the rounded surface of hips and valleys and for capping the ridges; bent with the grain to a 10-in. radius for the curves or roll at rakes; bent to a 20-in. radius against the grain (crosswise) for the curve at eaves and rounding of ridges, and flat for the flat surfaces of the roofs. On all WEATHERBEST thatched stained shingles except for the double first course at eaves, butts are specially sawn so that when laid, irregular, wavy courses will result.

Weathered Straw Color

Colored in three shades of weathered straw with an occasional spot of dull red and brownish green, the WEATHERBEST color scheme is a true reproduction of weathered straw. The different colored shingles come properly mixed and are laid as received. WEATHERBEST thatched stained shingles are also furnished in other color combinations if desired. One very pleasing color treatment is the WEATHERBEST method of graduating colors so that a roof may be green at eaves and gradually shade into a brown at ridges.

Thatched Effect Instruction Book and Service

Full information for constructing a WEATHERBEST thatched effect stained shingle roof is given in our book, "The Construction of WEATHERBEST Thatch Roofs," which is furnished on request. This book is complete in every respect, showing actual photographs of WEATHERBEST thatched effect roofs, working drawings showing rafter construction, furring, blocking, and method of laying shingles to secure the true thatched effect.

When thatched effect roofs are specified we ask that a set of plans be sent to us in order that we may estimate the quantities required of the different shingles.

Standard Specifications for a Thatched Effect Roof

The following specifications are standard for a WEATHERBEST thatched effect roof and should form part of the general specifications when this type roof is planned. Adherence to these specifications will insure complete satisfaction in finished roof by avoiding substitution of improperly bent, inferior flat grain shingles.

Special Rafter Construction—All rafter construction at ridges, rakes or gable ends, hips, valleys and eaves is to be in accordance with the instructions and detail drawings appearing in the book, "Construction of WEATHERBEST Thatch Roofs," furnished on request by the WEATHERBEST STAINED SHINGLE COMPANY, INC., of North Tonawanda, N. Y.

Furring of Rafters—(While desirable to accentuate the convex appearance of the roof, it is not entirely essential and may be omitted.) Main rafters to be furred to a height of 5 to 6 in. midway between eaves and ridges, diminishing to nothing at eaves and ridges where it merges with curves. Ridge board to be furred to height of 5 or 6 in. at center of roof diminishing to nothing at apex of gables.

Shingle Lath—Rafters at eaves and ridges and blocking at valleys, hips, rakes or gable ends to be covered with 1x2-in. shingle lath, spaced 1 in. apart, running parallel with rafters at rakes or gable ends, hips and valleys and at right angles to rafters at eaves and ridges.

Roof Shingles—All roof surfaces shall be covered with WEATHERBEST thatch stained shingles as manufactured and supplied by the WEATHERBEST STAINED SHINGLE COMPANY, INC., of North Tonawanda, N. Y., and St. Paul, Minn.

At eaves lay one double course of square butt WEATHERBEST stained shingles bent against the grain. Cover the curve at eaves with WEATHERBEST thatch stained shingles bent against the grain. Flat WEATHERBEST thatch stained shingles are to be used on all flat surfaces of roof and those bent with the grain to a radius conforming with curve for hips and valleys. Cover roll at rakes or gable ends with WEATHERBEST thatch stained shingles bent with the grain to a 10-in. radius. Cover curve of roof on each side of ridge board with WEATHERBEST thatch stained shingles bent against the grain, capping the ridge with those bent with the grain to a 20-in. radius.

Exposure of Shingles—Lay all shingles in irregular, wavy courses following procedure given in WEATHERBEST instruction book. Exposure to be from 1 to 3 in. (average 2 in.) on curve at eaves and 1 to 5 in. (average 3 in.) on all other sections of roof.

Nailing—Nail all shingles bent against the grain (at eaves and ridges) with 6d zinc coated nails, nailing 3 in. from the butt. Shingles on all other portions of the roof to be nailed with 3½d zinc coated nails in regular manner.

Color of Shingles—Color of shingles to be WEATHERBEST weathered straw. (If other color scheme is desired change to color number shown in our samples, or "to match.....")

Products

Ambler Asbestos Shingles for roofs and sidewalls, Ambler Asbestos Corrugated Roofing and Siding; Ambler Asbestos Roofing Tile; Ambler Ebonized Asbestos Lumber; Asbestos Fireproof Sectional School Buildings.

For Ambler Linabestos (Asbestos) Board, Ambler Linabestos (Asbestos) Siding, Ambler Asbestos Lumber, Ambler Asbestos Waltile, see page B1623.

The Company and Its Products

This Company supplies all the necessary appurtenances required in the installing of its products. All nails, clips, etc., exposed to the weather are heavy gauge copper, and the concealed nails are triply galvanized. Copper driving nails supplied if desired.

Ambler Asbestos Shingles

Ambler Asbestos Shingles are fireproof and waterproof, made of selected asbestos fibers and portland cement scientifically combined in water and formed under enormous hydraulic pressure. They are made in two general styles—uniform thickness, and tapered.

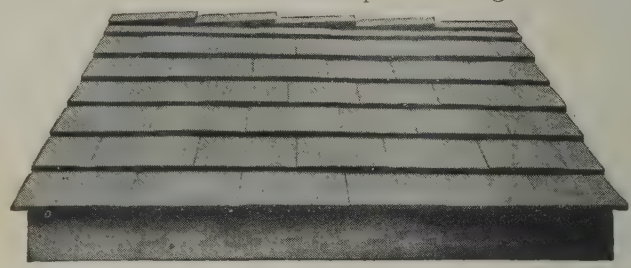
American Method No. 9—A ¼-in. shingle of uniform thickness, 9 in. wide and 18 in. long. The approximate weight per square is 675 lb. Furnished in straight butts, except when broken butts are specified. The colors are: Newport gray, Pearl gray, Indian red, Tuscan red, Spanish brown, purple, buff, blue-black and green veneer.

American Method No. 16—A $\frac{5}{32}$-in. shingle of uniform thickness, 8 in. wide, 16 in. long. Approximate weight per square, 425 lb. Furnished in broken butts if so specified; otherwise straight butts furnished. Made in the following colors: Newport gray, pearl gray, red, brown, black, green, buff and purple.

Honeycomb Method No. 4—A $\frac{5}{32}$-in. shingle of uniform thickness, 16 in. square, with the lower corners cut off so that when laid they produce a honeycomb or hexagonal effect. Weight approximately 290 lb. per square. Furnished in the same colors as American Method No. 16, listed above.

Tapered English Thatch Method—A tapered shingle, ½-in. butt, ⅛-in. upper end. Rough surface, edges and butts. Random widths, 6½ to 18½ in., 20 in. long. Approximate weight per square, 978 lb. Made in a variety of reds, browns, purples, greens, buffs and grays, and in black.

Tapered Colonial Method—A tapered shingle, ½-in. butt, ⅛-in. upper end. Random widths, 6 to 17 in., 19 in. long. Smooth surface; edges and butts cut square—designed for use where ordinary wood shingles might be specified, but where the architect desires to obtain a fireproof roof. Approximate weight per square, 930 lb. Colors same as for Tapered "English Thatch."



Tapered Ambler "Colonial" Asbestos Shingle Roof

Specifications for American Method of Laying Ambler Asbestos Shingles

Sheathing—All roofs specified to be covered with asbestos shingles, to be tightly sheathed with well seasoned boards, free from loose knots and to be well spiked to the rafters.

Felt—Over roof boards lay 1-ply slater's felt, weighing 15 lb. to the square, tacked on with 4-in. lap, and on hips and valleys with at least 1-ft. lap.

Ambler Asbestos Shingles—

Note: The following specification is written for both the $\frac{5}{32}$-in. No. 16 and the ¼-in. No. 9 shingle. To specify the No. 16, omit bracketed items; for No. 9, use bracketed items, omitting the others.

Over the felt, apply Ambler Asbestos Shingles (give color), as manufactured by the Asbestos Shingle, Slate & Sheathing Co., according to the American, or straight laid, method, following the manufacturer's details. Nail $\frac{3}{16}$x1-in. cant strip flush with the lower edge of roof board. Apply 1 course of No. 16A [No. 9A] shingles end to end laterally, overhanging the eaves 1½ to 1¾ in. Over this lay 1 course of No. 16 [No. 9] shingles with long edge at right angles to eave line breaking joints. Lay next course in same way, allowing 6-in. exposure. Balance of roof to be covered with No. 16 [No. 9] shingles 8x16 in. [9x18 in.] laid perpendicularly, breaking joints and exposed 7 in. [8 in.] to the weather. Each shingle to be nailed with two 1¼-in. galvanized iron needle point nails as indicated by the nailhole in the shingles, nails not to be driven down too tight. Hips and ridges to be covered with Ambler Asbestos Ridge and Hip Roll, properly flashed and fastened to hip or ridge pole of sufficient height, rabbeted to fit hip or ridge, with regular copper fasteners made for this purpose. All hips and ridges to be made watertight previous to the application of the ridge roll. (Hip and ridge can be covered according to regular Boston hip scheme, if desired.)

Flashing—At all hips, valleys, chimneys, and against all abutting sidewalls, except as otherwise specified, flash and counterflash with each course of Ambler Asbestos Shingles, using

. . . . . .

Specifications for Honeycomb Method of Laying Ambler Asbestos Shingles

Sheathing—See specifications for American Method.

Felt—See specifications for American Method.

These specifications also cover the application of No. 20, 12x12-in. Honeycomb shingles, using No. 21 Under Eave and No. 20 second starter.

Ambler Asbestos Shingles—Over the felt, apply Ambler Asbestos Shingles (give color), as manufactured by the Asbestos Shingle, Slate & Sheathing Co., according to the Honeycomb Method. Apply 1 course of No. 16-B end to end overhanging the eaves 1½ to 1¾ in., over which lay a course of No. 4 entirely covering the No. 16-B exposed 13x13 in. to the weather. Each shingle to be nailed with two 1¼-in. gal-

Continued on next page

vanized iron, needle-point nails, and the No. 4 to be fastened down at the tip with patented copper "Storm" nails. Hips and ridges to be covered with Ambler Asbestos Ridge and Hip Rolls, fastened in place to hips or ridge poles of sufficient height and rabbeted to fit hips or ridges, with regular copper fasteners made for this purpose. All hips and ridges to be made watertight previous to the application of the ridge rolls.

Flashing—See specifications for American Method.

Specifications for "English Thatch" or "Colonial" Tapered Ambler Asbestos Shingles

Note: The following specifications are written to cover both the "English Thatch" and "Colonial" Tapered Ambler Asbestos Shingles, as sold by the Asbestos Shingle, Slate & Sheathing Co., Ambler, Pa.

Tapered Ambler "English Thatch" Asbestos Shingle Roof

When specifying the "English Thatch" omit the items in brackets; for "Colonial" substitute those bracketed and omit the others.

Felt—Apply the sheathing boards so that the distance between same shall not be more than ¼ in.; then apply a 30-lb. saturated asphalt felt over entire roof surface. This felt should be lapped 6 in. on all joints and a double thickness should be used on all hips, ridges and in valleys.

Starting Course—Asbestos starters, 9x18 in. x ¼ in. thick, designated as No. 9-A, shall be laid end to end laterally, covering the eaves and projecting over the edge of the roof boards 1½ or 2 in. However, before these starters are applied, a wood strip 1¼x¼ in. shall be nailed to the roof flush with the eaves, to give the starters and shingles the proper cant.

Shingles—Over top of and flush with the starters, "English Thatch" ["Colonial"] Tapered Ambler Asbestos Shingles shall be applied. Details regarding the random exposures and various widths shall be supplied by the architect in charge of construction. We, however, recommend that none of these "English Thatch" ["Colonial"] Tapered Ambler Asbestos Shingles be applied with less than a 3-in. headlap.

Nails—We recommend that copper nails be used, of sufficient length so that they will be driven into the wood sheathing boards at least 1 in. Care should be taken in application to eliminate the possibility of nailing the shingles too tightly to the roof as there is a certain amount of expansion and contraction in a cement product and this must be considered. Galvanized nails can be used in place of copper if desired.

Hips and Ridges—All hips and ridges shall be covered with "English Thatch" ["Colonial"] Tapered Ambler Asbestos Shingles 6 in. wide (or any other width desired), and applied according to the Boston Method (or, if desired, the last course of shingles may be mitered on hips and ridges and thus eliminate additional covering).

Flashing—All metal flashings and counterflashings shall be 16-oz. soft, cold rolled copper and sufficient shall be used so as to guarantee a watertight application. Lead may be used in place of copper if desired.

Ambler Asbestos Corrugated Roofing and Siding

This material is made of asbestos fiber and hydraulic cement and is the same as Ambler Asbestos Shingles in its structure and quality. It is made in two widths of sheets, 42 in. and 27½ in.

The 42-in. material is $\frac{11}{32}$ in. thick on the ridges and in the valleys, and $\frac{9}{32}$ in. thick at center of slope. Corrugations are 2⅝ in., center to center. Sheets are available in lengths of 4, 5, 6, 7, 8 and 8½ ft. Weight, 3¾ lb. per sq. ft.

The 27½-in. material is $\frac{5}{16}$ in. thick on the ridges and in the valleys, and ¼ in. thick at center of slope. Corrugations are 2½ in., center to center. Sheets are available in lengths of from 4 to 10 ft., inclusive. Weight, 3½ lb. per sq. ft.

A separate catalogue covering this commodity more completely will be furnished on request.

Ambler Asbestos Roofing Tile

Ambler Asbestos Roofing Tile lays up 200 pieces per square (100 sq. ft.). When no definite number of top and pan tile is specified an equal number of each is shipped.

Weight of tile, laid on roof, per square, 775 lb.

Weather exposure of tiles, 13½ in.

Ambler Asbestos Roofing Tile is supplied in red veneer and green veneer only.

Ambler Ebonized Asbestos Lumber Switchboard

Ambler Ebonized Asbestos Lumber

Because of its high dielectric properties, Ambler Ebonized Asbestos Lumber is ideal for use in place of wood or slate for mounting electrical switches, fuse boxes, etc., in residential work.

Ambler Ebonized Asbestos Lumber has primarily the inherent strength qualities of the non-impregnated asbestos lumber. Thorough impregnation with a specially developed compound gives a product superior in physical and electrical insulation properties, as well as in appearance.

On account of its greater strength, switchboards made of this material may be greatly reduced in thickness, thereby reducing materially the weight of the board, as well as permitting economy in the amount of copper used.

Ambler Ebonized Asbestos Lumber is listed by the Underwriters' Laboratories, Inc., and meets the United States Navy specifications.

Asbestos Fireproof "Liberty" School Buildings

Simplicity of Construction—These buildings are regular "sectional" type buildings using Ambler Asbestos Lumber, and can be erected in extremely short time by local carpenters.

Cost—Taking into consideration the present high cost of skilled labor necessary to erect a frame, brick, stone, plaster or hollow tile building that would even approximately compare in appearance and durability, the cost would be substantially more, especially for frame or like type of construction that has to be painted.

"Liberty" School Building Built of Ambler Asbestos Products

BIRD & SON, inc.

Manufacturers of Roofings, Building Papers and Wall Board

MILLS AND GENERAL OFFICES
EAST WALPOLE, MASS.

CHICAGO OFFICE AND PLANT: 1472 West 76th Street NEW YORK OFFICE: 295 Fifth Avenue
HAMILTON, ONTARIO, CANADA: Building Products Ltd., Bird & Son Division

Products

Bird's Asphalt Slate Surfaced Shingles, Paroid Roofing, Bird's Built-up Roofs, Neponset Wall Board, Neponset Black Building Paper and other Waterproof Building Papers.

Experience and Facilities

Bird & Son, inc., was established in 1795, and after years of experience in paper manufacturing became one of the pioneers in specializing in the manufacture of waterproof building paper and asphalt roofings.

The highest quality of materials is maintained through the most up-to-date machinery and methods and a highly efficient personnel. The several mills and warehouses of the company provide for prompt shipment anywhere.

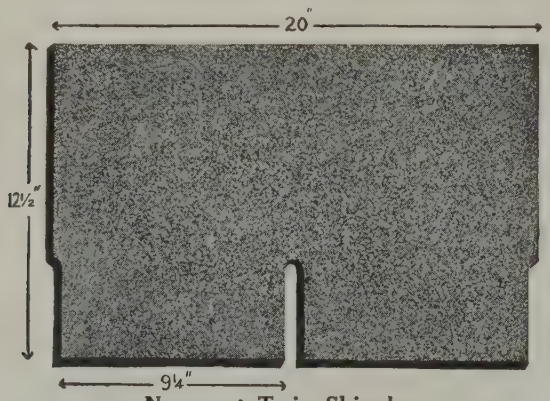
Bird's products have been distributed and applied to buildings of every description throughout the world and have long been known to be of the highest grade.

Bird's Asphalt Shingles

Bird's Asphalt Shingles are distinctive. They are made in a variety of styles suitable for all sorts of buildings, from the low price house to the costly residence.

They are made of long fibre felt and pure asphalt with maximum saturation, super-surface and coated back.

Bird's Asphalt Shingles are made in plain shades of red, green and blue-black. They are also made in an unusually attractive and colorful effect, produced by a selection of several shades of brown, reds and russets, known as "Bird's Art-Blende."



Neponset Twin Shingle

The following types of shingle are particularly recommended for the architect's specifications. All but the Standard Individual are available in the Art-Blende color.

Neponset Twin Shingles—12½x20 inches, laid 4 inches to the weather, giving a ½-inch overlap beyond three layers.

Bird's Super Twin Shingles—12x20 inches, laid 5 inches to the weather. An extra heavy twin shingle combining the features of Neponset Twins with extra weight and massive appearance.

Bird's Standard Individual—8x12½ inches, laid 4 inches to the weather. A high grade individual shingle of standard dimensions. Recommended for residential work.

Giant Individuals—10x15½ inches, laid 5 inches to the weather. An unusually heavy and massive giant shingle giving an impression of thickness and weight adequate for the more expensive residences.

Application—Bird's Asphalt Shingles should be applied over dry roof boards laid close together, sheathed with Neponset Black Building Paper; roofer to follow instructions enclosed in each bundle of shingles.

Paroid Roll Roofing

Paroid Roll Roofing is of the highest quality, protected with a coating on both sides and with a special talc surfacing of bright gray color.

Paroid is most satisfactory for specifications for large roof surfaces, such as: barns, freight sheds, train platforms, garages, etc. It may also be specified for low pitch roofs on porches and dormers of all types of residences.

Paroid comes in rolls of either 108 or 216 square feet with lap cement and nails. Made in three weights, 45, 55 and 65 pounds per square. Roofer should apply according to directions enclosed in each roll.

Neponset Black Building Paper

Neponset Black Building Paper has been known and specified by architects for years as a waterproof building paper of the highest grade. A strong bodied paper thoroughly saturated with asphalt, protected with asphaltic coating on both sides, giving an absolutely waterproof paper. Recommended particularly for use:

(1) Under all kinds of roofing.
(2) Behind clapboards and shingles or stucco on the walls of buildings.
(3) Between floors.
(4) Between double floors that extend over an open porch.
(5) Within walls of house, store or factory in place of backplaster.
(6) For cellar lining.
(7) For cold storage work.

Put up in rolls 36 inches wide containing 500 square feet, weighing 50 pounds per roll.

Specifications for use of Bird's Neponset Black Waterproofing Building Paper—

Beneath Clapboards and Shingles—Underneath the clapboards or shingles shall be applied 1 layer of Bird's Neponset Black Waterproof Building Paper, lapped not less than 2 inches and tacked to hold in place.

Beneath Roofing—Underneath the roofing, 1 layer of Bird's Neponset Black Waterproof Building Paper shall be applied; paper to be lapped not less than 2 inches and tacked along the seams, sufficient to hold in place.

Back of Stucco—Over the sheathing boards 1 layer of Bird's Neponset Black Waterproof Building Paper lapped not less than 2 inches. Hold paper in place with furring strips spaced about 16 inches on center. Nail metal lath firmly to furring strips and apply stucco to the lath.

Beneath Double Floors—Between the double floors or underneath the parquetry shall be placed 1 layer of Bird's Neponset Black Building Paper. Paper to be lapped not less than 2 inches and tacked sufficiently to hold in place.

Continued on next page

Neponset Wall Board, Cream White Finish

Neponset Board is a high grade laminated fibre board that will not chip or crack. The finish is a beautifully embossed cream white surface thoroughly moisture-proofed. The reverse is a tan color, waxed to keep out moisture. The cream white surface may be painted for any desired effect. Neponset Board comes in sheets 48 inches wide, 7 to 12 feet long. Nailhole positions are indicated by dents along the edge of the boards.

Bird's Paroid Built-Up Roof

Bird's Paroid *Built-Up* Roof, built up of successive layers of asphalt felt, asphalt compound applied hot, and Paroid Cap Sheet, gives a heavy, impenetrable mass of absolutely weatherproof materials, capped with the well-known Paroid Smooth Surfaced Roofing. There is no slag or gravel to fall off and clog the gutters.

The illustration and specification which follow are for the most usual type of Paroid Built-Up Roof over sheathing boards. We will furnish on request specifications as follows:

(1) Bird's Paroid Built-Up Roof, light, over sheathing boards.

(2) Bird's Paroid Built-Up Roof, standard, over sheathing boards. (See specification below.)

(3) Bird's Paroid Built-Up Roof, extra heavy, over sheathing boards.

(4) Bird's Paroid Built-Up Roof, light, over non-combustible roof decks.

(5) Bird's Paroid Built-Up Roof, standard, over non-combustible roof decks.

(6) Bird's Paroid Built-Up Roof, extra heavy, over non-combustible roof decks.

Specifications for Bird's Paroid Built-Up Roof, Standard for Application over Sheathing—

Preparation of Sheathing—The roof shall be laid upon seasoned sheathing preferably tongued and grooved, not over 6 inches in width. All rubbish and projections shall be removed from the roof by the contractor preceding the roofer. The ends of all sheathing boards shall rest on rafters or purlins, properly nailed and secured. The sheathing shall be reasonably free from knots and holes, and where holes do occur these shall be covered with metal securely nailed. The roof shall be properly graded to outlets and all drainage connections set to permit the free flow of water. All this work to be done by the general contractor preceding the roofing contractor. Triangular wood strips about 2 inches high shall be installed by owner or general contractor in all angles formed by the roof and a vertical surface.

Flashings—All brick or concrete walls, etc., shall be primed with Bird's Asphalt Primer before flashing with the roofing material. Where not otherwise shown on plans, walls and all elevations above the roof such as skylights, curbs, etc., shall be flashed at least 6 inches high. The flashings to be built up in the same manner and of the same material as the roof itself. Flashings shall be reinforced by a base flashing of Bird's Cap Sheet 9 inches wide, mopped 6 inches up the wall and 3 inches on the roof. An approved metal counterflashing shall extend down over the wall flashing at least 4 inches, and where pipes, vents, etc., come through the roof, they shall be flashed with a lead collar, both to be furnished and installed by the general contractor or owner.

Material—Materials required per 100 square feet of completed roof surface—gross weights:

2 layers Bird's 14-lb. Asphalt Felt (36-inch width)	31	pounds
2 layers Bird's Built-Up Roof Compound	50	pounds
1 layer Bird's Paroid Cap Sheet (coated one side only, 36-inch width)	37½	pounds
Flexible extra large head roofing nails (⅞ inch long)	1	pound
Total weight of finished roof	119½	pounds

The quantities above stated do not include the material necessary for flashings nor do they include wastage.

Note: Many roofers recommend the use of a layer of sheathing paper to be used next to the sheathing boards. This is especially good over roof boards that contain pitch or sap.

Application—First: A sheet of Bird's Asphalt Felt 18 inches wide shall be laid along the lowest edge of the roof. This felt shall be mopped with Bird's Compound heated to not less than 400° F. and while hot a second sheet of asphalt felt 36 inches wide shall be rolled into same. Similarly succeeding sheets of asphalt felt 36 inches wide shall be laid lapping each sheet 19 inches until the surface of the roof shall be covered with two layers of asphalt felt mopped together with hot compound, so that felt does not touch felt. Flexible large head roofing nails shall be used, nailing 4 inches apart along the lower edge of each sheet, as applied.

Second: The Bird's Asphalt Felt along the lower edge 36 inches wide shall be mopped with Bird's Compound heated to not less than 400° F. and while hot a sheet of Bird's Paroid Cap Sheet 36 inches wide rolled into same. The cap sheet must follow mop closely to insure a perfect bond. In a similar manner the second and succeeding sheets of Bird's Cap Sheet 36 inches wide shall be mopped in, overlapping the preceding sheet 2 inches. All cross laps of the cap sheet shall be mopped and lapped 4 inches.

The surfaced side of Bird's Cap Sheet shall be laid to the weather.

Careystone ASBESTOS-CEMENT PRODUCTS
TRADE-MARK

Careystone Asbestos-Cement Products

Careystone Asbestos-Cement Building Materials are made of two of the most durable fire-resistant materials known—asbestos and special portland cement.

They are verminproof, dampproof, dustproof, fireproof, and will not rot or rust. They are manufactured in a new million dollar plant recently added to the Carey manufacturing resources at Lockland, Cincinnati, Ohio. The guaranteed quality of these asbestos products is backed by the Carey reputation—and over fifty years of service to the building trades.

Careystone Asbestos-Cement Shingles

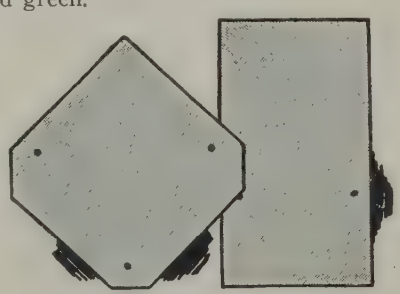
Furnished in a variety of shapes for application by the French or American method.

For the French method, one shape is available, in two sizes —16x16 in. and 12x12 in.

For application by the straight, or American method, two shapes are available with two sizes for each shape—8x16 in. and 6x12 in.

Colors—Careystone Asbestos-Cement Shingles, in all shapes and sizes, are available in six colors—brown, pottery red, blue-black, slate gray, purple and green.

Advantages—Careystone Asbestos-Cement Shingles can be laid over old wooden shingles as easily as on new roof construction. They will outlive the building itself, for they actually grow stronger with age. They are light enough to need no special supporting construction. And the variety of shapes, sizes and colors give the architect an unlimited field for designing a roof to meet individual tastes.



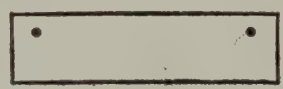
French Shingle American Shingle

Rating—When laid over Carey Fiberock Felt, French method, Careystone Asbestos-Cement Shingles take a Class "B" rating of the Underwriters' Laboratories, Inc. With the American method, they take a Class "A" rating.

The French Method—No. 415 shingle when laid honeycomb or French method, is exposed 13x13 in. to the weather, and requires 87 shingles to cover one square of roof area. The shingles weigh approximately 270 lb. per square.

No. 416 shingle when laid honeycomb or French method is exposed 9½x9½ in. to the weather, and requires 160 shingles to cover one square of roof area. These shingles weigh approximately 285 lb. per square.

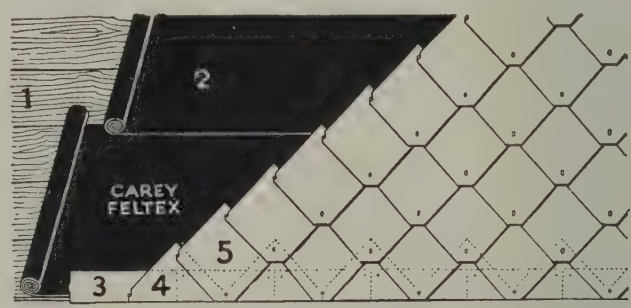
Application of Careystone Asbestos-Cement Shingles (French Method)—Cover sheathing on entire roof surface with Carey Fiberock before laying Asbestos Shingles. To insure proper application of Careystone Asbestos-Cement Shingles, a vertical chalk-line should be stretched on the roof deck from the center of the eave to the ridge pole. Snap this chalk-line and place a 4x16 in. eave starter at the exact center of the eave. Allow the starter to extend 1 in. over the sheathing and apply the full line of starters to both gable ends. At each gable end the last starter should extend 1 in. beyond the gable line, and, if necessary starters should be cut to make them fit.



Eave Starter

Second Starter

To assist in lining up the first course or eave starters, a horizontal chalk-line should be snapped on the roof. Then proceed by applying a triangular, or second course starter over the eave starter, with the ends meeting at the exact center of the eave starter, directly over the vertical roof line. Place copper storm nails in the slot provided in the ends of the triangular starter. Each starter, when properly placed, should be nailed to the sheathing through the two holes provided for the purpose.



Application of Careystone Asbestos-Cement Shingles (French Method)

The next step is the application of the main body shingles. Place the first shingle at the center line, with the hole in the lower end over the storm nail, and the opposite end of the shingle in line with the vertical roof line.

Proceed in this manner, using care to see that the storm nail notches at the sides of the shingles are opposite, and that the nails are inserted properly. Then nail the shingles to the roof deck with galvanized nails, using the nail holes provided for that purpose in each shingle.

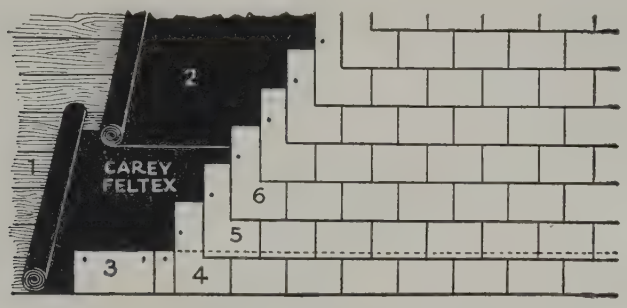
On a re-roofing job, the ridge pole should be covered with a strip of Fiberock before the application of the last row of shingles at the ridge. On a new roof, this felt laps over the ridges about 12 in., and for a new roof this same distance is specified. After main body shingles have been set in place, remove exposed portions of felt.

The American Method—Careystone Asbestos-Cement Shingles, American method are stocked in two sizes.

Continued on next page

Nos. 435, 436, 440 and 441 when laid in American method are exposed 7 in. to the weather and require 260 shingles to cover one square of roof area. In the $\frac{5}{32}$ in. thickness they weigh approximately 400 lb., and in the ¼ in. thickness 575 lb. per square.

No. 437 when laid American method is exposed 5 in. to the weather and require 480 shingles to cover one square of roof area. These shingles weigh approximately 450 lb. per square.



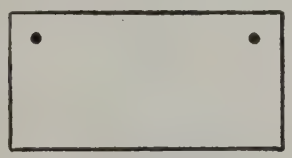
Application of Careystone Asbestos-Cement Shingles (American Method)

Application of Careystone Asbestos-Cement Shingles (American Method)—The application of Careystone Asbestos-Cement Shingles under the American or straight laid method is as simple as applying wooden shingles.

The first step is to apply one course of eave starters, allowing them to extend 1 in. over the eave. Then proceed with the first course of main body shingles, laid at right angles to and over the starter course, breaking all joints.

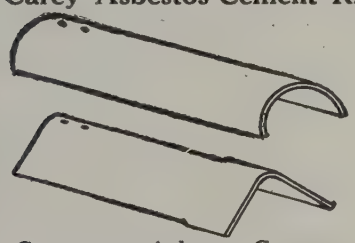
Proceed in this manner with the remainder of the roof, exposing 7 in. of each shingle to the weather, and secure each one to the roof deck with galvanized nails driven through the holes provided for them.

In driving the nails avoid unnecessary blows after nail is driven home.



American Starter

Carey Asbestos-Cement Ridge Roll



Careystone Asbestos-Cement Ridge Rolls

Made in the same manner as Carey Asbestos-Cement Shingles—with special portland cement and tough asbestos fibres.

The roll is designed to blend perfectly with the shingles and to give added attractiveness to the roof.

Furnished in both curve and angle shapes as illustrated.

Carey Asfaltslate Shingles

For use on any roof having a pitch of not less than 4 in. in 12 in. They combine beauty, durability and economy and will not curl.

Composed of a heavy rag felt base, thoroughly saturated with a highly refined asphalt saturant, and are coated on both sides with a uniform layer of pure asphaltic cement. The shingles are then surfaced with a uniform layer of natural crushed slate, thoroughly rolled into the hot coating asphalt under roller pressure.

Carey Asfaltslate Shingles are made in two sizes 8x12¾ in. and 10x15¾ in.

The regular 8x12¾ in. shingles come 53 shingles per bundle, are packed 8 bundles per square and weigh 240 lb. per square. They are laid ½ in. apart and exposed 4 in.

The 10x15¾ in. shingles come 34 per bundle, are packed 8 bundles per square and weigh approximately 300 lb. per square. They are laid ¾ in. apart and exposed 5 in.

Carey large size Asfaltslate Shingles are especially well adapted for application over old wood shingles. Being unusually large it requires fewer shingles to cover the roof, and cost of nails and labor are reduced considerably.

Furnished in red, green, blue-black and color blend. Applied with ordinary roofing nails, no clamps, locks or cleats are used.

Carey Cork-Insulated Shingles

Made in the same manner as the regular Carey Asfaltslate Shingle with a layer of granular cork added to the underside.

Tests made by Mellon Institute of Industrial Research show that when these shingles are laid in the regular way (three thicknesses) they are equivalent in insulating value to ½ in. of fibre insulating material, 4½ in. of slate, 10 in. of sandstone, 8 in. of concrete and are 231% better heat insulators than ordinary felt shingles.

They are 50% thicker than the ordinary shingle and cast deep dark shadow lines giving texture to the roof, an effect wholly lacking when thin shingles are used.

Carey Cork Insulated Shingles are made in 10x15¾ in. size, weighing approximately 350 lb. per square. Furnished in red, green, blue-black and color blend. Applied like the regular plain back Carey Asfaltslate Shingles.

Carey Strip Shingles

Square tab strip shingles, 4 in 1, two sizes: 36x10 in., 190 lb. per square; 36x12½ in., 240 lb. per square. Hexagonal strip shingles, three sizes: 10x40 in., 3 tab, 160 lb. per square; 12½x36 in., 2 tab, 225 lb. per square; 12x40 in., 3 tab, 210 lb. per square. Furnished in red, green, blue-black and color blend. Directions for application packed in each bundle.

Package

Carey individual shingles are packed in bundles containing one-eighth square, or metal strap packages containing one-quarter square. One square of shingles packed for shipment occupies 7 cu. ft. of space. Carey strip shingles 36x10 in. are packed two bundles per square; 36x12½ in.—three bundles per square. Carey hexagonal strip shingles are packed two crates per square.

Underwriters' Label

Carey shingles are tested and accepted as standard by the Underwriters' Laboratories, Inc.

All Carey shingles bear the Underwriters' Class "C" label.

Shingle Specifications

Shingles shall be Carey (state brand here) shingles, and shall be delivered on the job in packages bearing Carey labels.

Sheathing boards must be thoroughly dried and well seasoned, 6 in. wide and laid parallel with eaves. Line valleys with valley lining, 18 in. wide, nailing 4 in. in from either side (nails 12 in. apart); do not nail in center. Lay 9-in. wide starter strips along eaves, extending over ½ in. Nail 1 in. from lower edge, nails 6 in. apart.

To apply Carey individual shingle begin with full sized shingle parallel to and flush with outer edge of roof, lower end flush with lower edge of starter strips. Use large headed 1-in. galvanized nails, 2 nails to each shingle, 4½ in. from lower end and 1 in. from sides. Allow ½ in. space between 8x12¾ in. shingles and ¾ in. between large size 10x15¾ in.

Start second row using two-thirds width shingle, leaving 4 in. of first row exposed.

Start third row using one-third width shingle, same spacing. In starting fourth row use a full size shingle and continue as shown in sketch.

Careystone Asbestos-Cement Sheathing

Careystone Asbestos-Cement Sheathing can be sawed, joined and fitted very easily by any ordinary mechanic. This sheathing is fire-proof, tough and practically indestructible.

Can be grained, veneered or painted to a beautiful finish, making it particularly desirable for interior as well as exterior use. It is unsurpassed in its fire-resisting qualities and its ability to withstand adverse temperature conditions. Supplied in its natural light gray color. Sizes, 42x48, 42x96, 48x48 and 48x96 in. Thickness ⅛ to 1 in.

Careystone Asbestos-Cement Wall Board

An ideal material for lining and fireproofing all classes of buildings. The material cuts and nails like ordinary lumber. It can be washed, scrubbed and cleaned with ease, and can be painted, grained or stained to represent natural wood. Made in two sizes, 48x48 in.; 48x96 in.; $\frac{3}{16}$ in. thick.

Corrugated Asbestos-Cement Roofing and Siding

Is fireproof and practically indestructible. It comes in sheets; is easily cut and applied. It offers an excellent covering for the roofs and sides of buildings.

CERTAIN-TEED ASBESTOS SHINGLES

Certain-teed asbestos shingles are made from a high grade Canadian asbestos fibre and Portland cement, both of which are practically indestructible. They are manufactured under a method known as laminated, and have unusual toughness and strength.

The asbestos and Portland cement are thoroughly mixed in a beater and the mixture is run over a forming machine to form a sheet from which the shingles are cut.

Certain-teed asbestos shingles are trimmed in an automatic die press, which at one operation shapes the shingles, punches the holes and clips the corners, so that all shingles are identical as to dimensions.

Colors

Certain-teed asbestos shingles are made in a variety of colors. The colors are permanent, and this fact should be taken into consideration when comparing with other types of shingles having a surface or veneer color. *With Certain-teed asbestos shingles the colors are permanent.*

Durability of Certain-teed Shingles

These shingles are as lasting and indestructible as the asbestos and Portland cement from which they are made. They are fireproof and meet all requirements of the Underwriters' Laboratories.

Materials Required for a Certain-teed Asbestos Shingle

The pieces making up a Certain-teed asbestos shingle roof are 1st course starters (eave starter), 2nd course starter (eave shingle), main body shingle and ridge roll.

The shingles are manufactured in the 16x16 in. size. The fixtures consist of an asphalt saturated asbestos felt sheathing (for a new roof only), zinc coated needle point galvanized nails, copper storm nails and ridge roll fasteners. 1¼ in. needle point nails are used for new work, and 2 in. needle point nails for re-roofing over old wooden shingles.

For Application to Old Roofs

Certain-teed asbestos shingles are ideal for reroofing as well as for new roofs. They may be applied over the old wooden shingles, thus eliminating the expense and inconvenience of removing the old shingles.

Do not remove the old roof. It serves as an additional insulation against summer heat and winter cold. This applies to re-siding as well as re-roofing, as Certain-teed asbestos shingles can be applied on the side of a building in the same manner as over an old roof.

Suggested Specifications for Architects Use

For new work only

(1) All roof surfaces shall be covered with (.... [insert color here]) Certain-teed Asbestos Shingles 16x16 in. hexagon shaped, as manufactured by CERTAIN-TEED PRODUCTS CORPORATION.

(2) **General**—This Contractor shall examine all roof board surfaces and shall see that they are smooth, clean and dry before proceeding with the roof covering.

(3) **Application**—Furnish and apply a ¼x1½-in. cant strip or lath securely nailed flush with the edge of all eaves. Furnish and apply on all ridges and hip ridge and hip poles of the required size, all securely nailed in place.

(4) On all new work the wood roofs shall be covered with a sheathing of asphalt saturated asbestos felt weighing not less than .. lb. laid in horizontal layers, with joints lapped towards eaves and at ends as necessary, to properly hold the felt in place and protect the structure until covered by the shingles. This felt shall be lapped over all hips and ridges and shall be lapped 2 in. over the metal of any valleys or built-in gutters. This felt shall be preserved unbroken, tight and whole.

(5) After the felt has been applied, the Contractor shall lay the shingles according to the hexagonal method and in strict accordance with manufacturers instructions. Each shingle shall be secured with two (2) 1¼ in. zinc coated needle pointed galvanized nails and copper storm nails, as directed by the manufacturer.

(6) All ridges shall be covered with asbestos ridge roll secured in place as provided for by the manufacturer.

(7) All hips shall be covered with hip rolls similar to the ridge roll above specified and applied in the same manner. The intersection of all hip and ridge rolls shall be covered and finished with sheet lead or copper terminals, securely fastened in place.

(8) **Flashings, Gutters and Downspouts**—All metal flashings, gutters and downspouts will be provided by the Sheet Metal Contractor. This Contractor shall co-operate with the Sheet Metal Contractor so that all flashing and shingle work shall be installed in a manner that will guarantee the weather-tightness of the entire roof.

Note: Plain copper, lead coated copper or sheet lead is recommended for all flashings, gutters and downspouts.

For old work only

(a) All present roof covering shall remain and shall be treated as hereinafter specified. All roof surfaces shall be covered with (.... [insert color here]) Certain-teed Asbestos Shingles 16x16 in. hexagon shaped, as manufactured by CERTAIN-TEED PRODUCTS CORPORATION.

(b) **General**—This Contractor shall examine all present wood shingles and shall proceed as follows:

(c) Remove old shingles at all gable ends about 6 in. from the edge of gable moulding and insert a 6 in. wide board of sufficient thickness to bring the board flush with the tops of the old shingles. Where old shingles are badly warped or curled, they shall be split in the center and ends nailed down. At all ridges and hips remove last course of old shingles and place a hip or ridge pole of sufficient height for nailing of the ridge or hip roll.

(d) **Application**—No felt will be required over the old shingles.

(e) The Contractor shall lay the shingles according to the hexagonal method and in strict accordance with manufacturers instructions. Each shingle shall be secured with two (2) 2 in. zinc coated needle pointed galvanized nails and copper storm nails, as directed by the manufacturer.

(f) (Use paragraph (6) as per above specification for new work.)

(g) (Use paragraph (7) as per above specification for new work.)

(h) **Flashings, Gutters and Downspouts**—(Use paragraph (8) as per above specification for new work.)

ETERNIT ASBESTOS SHINGLES, rigid shingles made of portland cement and asbestos fibre.

ETERNIT ASBESTOS LUMBER, a fireproof insulating board made of the same materials as ETERNIT Shingles, but furnished in large sheets.

ETERNIT ASBESTOS CORRUGATED SHEETS, made of the same materials as ETERNIT Lumber and Shingles.

Eternit

TRADE-MARK

The Eternit Process

In 1900 Ludwig Hatschek, an Austrian, invented the process for making asbestos-cement products and coined the name Eternit. Asbestos shingles were first manufactured under the Eternit process, then asbestos lumber and corrugated asbestos sheets. The newest development in the Eternit process is a method of producing colors that will never "bloom" or fade. Eternits are absolutely colorfast and fadeproof.

Services and Samples

Complete instructions for the application of Eternit Asbestos Shingles, including full information on flashings, valleys and curved surfaces, will be sent to any architect upon request. These instructions are illustrated with drawings and this work represents one of the most complete texts on shingle roofing.

Small samples in the various colors or full size samples will be sent to any architect upon request.

Literature, illustrating the different designs and colors and giving more detailed information, is available to any architect.

To Specify—Your specification should read:

All roof surfaces shall be covered with Eternit Asbestos Shingles,..... method,.....size,..... color, laid in accordance with the specifications of ETERNIT, INC.,....[copper] [galvanized] nails shall be used.

ETERNIT ASBESTOS SHINGLES

General Description

An Eternit Asbestos Shingle is a rigid slab of rock. A shingle is just as permanent and fireproof as its component parts. Only two of nature's minerals—both indestructible materials are used in the manufacture of Eternits.

Asbestos rock, centuries old, has been defying the elements for ages without the slightest sign of rot or disintegration. The asbestos used in Eternits is made up of long, talc-free, rough-surfaced fibers. Portland cement—the only other ingredient—is also a fireproof, everlasting, rotproof material. Only highest grade portland cement, made to Eternit specifications, is used.

An Eternit Autumn Bronze Roof Enhances the Attractiveness of This Beautiful Home

The Eternit process (not cast or moulded) consists of a gradual building up of these two materials. Eternit machines use a mixture of asbestos fiber and portland cement. They gradually build up a large homogeneous sheet of material. This sheet is later cut up into shingles which are subjected to enormous hydraulic pressure. Then an amazing, new Eternit process makes the colors fast.

This gradual building up process insures that the reinforcing asbestos fibers will lie parallel to the surface of the shingle and that they will be *distributed uniformly.* The asbestos fibers act as a reinforcing binder. Fibers for Eternits are rough-surfaced like a steel bar. The Eternit process secures an absolutely even distribution of the asbestos fibers. That is why Eternits are stronger, tougher, more resilient.

So that you may be protected against substitution of inferior materials, the Eternit trade-mark is embossed on every Eternit asbestos-cement product.

Color Fast Shingles

Architects everywhere are using more and more color. Outside as well as inside the home, color has come to be an essential part of the design. The day of the drab, ugly, colorless house is gone. One of the most important features in the use of color, however, has been the necessity for tones and shades which would retain their original beauty and neither "bloom" nor fade.

This Eternit Roof Replaced a Slate Roof on the First Presbyterian Church, Jacksonville, Fla.

Now an exclusive process enables Eternit to offer to the architect the result of years of research. Deep, rich colors in asbestos shingles which *will not fade.* The colors you select originally for your roof are those which will be there years from now, for Eternits are everlastingly fadeproof. Your roof will withstand weather, fire and general wear and tear.

Colors and Sizes

Standard—Each of the five standard Eternit colors—Emerald Green, Autumn Bronze, Indian Red, Quarry Blue and Colonial Gray—is furnished in all Eternit styles and sizes. The Horizontal Method (12x24 in.); the American Method (8x16 in., 9x18 in. and 12x24 in.); the Hexagonal Method (16x16 in. and 12x12 in.).

Different Color Combinations Are Secured by Varying the Proportions of the Five Heatherblend Colors

Heatherblend—The Heatherblend is a combination of five special colors—moss, terra cotta, olive, meadow, sienna—used in equal proportions. Furnished in the American Method in the 8x16 and 9x18-in. (¼-in. thick) sizes only.

The Eternit Horizontal Method Offers Architectural Distinction at Low Cost

Methods of Laying Eternits

There are three distinctive methods of laying Eternit Asbestos Shingles. Each of these has its appropriate use and location and the architect will be surprised and pleased with the harmonious effects produced.

American Method—This method is laid with straight edges like slate and provides pleasing roof lines, deep shadows and variance of shade. It furnishes a two-thickness, sturdy roof, giving double protection from the elements.

This Charming Eternit Roof Presents Pleasing Lines and Harmonious Colors

This Eternit Heatherblend Roof Is a Tapestry of Beautiful Colors

Horizontal Method—This is an exclusive Eternit design and is obtainable nowhere else. Needless overlapping is eliminated and the shingles are easily and rapidly applied. Each shingle is laid with a side lap of 4 in. and a top lap of 3 in. This gives a long horizontal effect which is most attractive. This design costs the same as the inexpensive Hexagonal Method.

Hexagonal Method—Because it requires a minimum of material, the Hexagonal Method costs very little more than the flimsiest type of temporary roofings. Unusual lines and shadows make this method most appropriate for any type of structure.

Specifications

Complete specifications for any method may be obtained upon request, or the architect may select the color and size of shingle to be used and state that they shall be applied in accordance with the manufacturer's directions.

ETERNIT ASBESTOS LUMBER AND CORRUGATED SHEATHING

Eternit Asbestos Lumber

Eternit Asbestos Lumber is made by the same process and from the same materials as are Eternit Asbestos Shingles. This lumber has all the strength, toughness and resiliency of Eternit Shingles and it is just as fireproof. There is no rot or decay. It may be painted if desired, although this is not necessary. Can be installed by any carpenter with ordinary tools. It may be used for both inside and outside construction, and in industrial plants its uses are almost unlimited. Ceilings, walls, partitions, shaft enclosures, laboratory furniture, fire doors, heat-treatment oven doors, acid and gas conveyors represent only a few of the many uses.

Eternit Asbestos Lumber comes in ⅛-in. thicknesses up to 1 in. A special $\frac{5}{16}$-in. thickness is recommended for wall board use. Standard sheets in all thicknesses are 42x96 and 48x96 in. Half sheets 42x48 and 48x48 in. furnished without extra charge.

Eternit "Big-Seven" Corrugated Asbestos Sheathing

This product is used principally for roofing and siding of industrial structures. Made from the same materials as Eternit Shingles the first cost is the last cost. Corrugating the material increases its strength. In tests conducted under the supervision of the Robert W. Hunt Co., these sheets over a 45-in. span supported 3175 lb. before breaking. Special Eternit fasteners secure the sheets.

Colors are Colonial Gray and Indian Red. Corrugations, 7 in. center to center; height, 2¼ in.; thickness, ¼ in.; width, 38½ in.; over all lengths, 3 ft., 3 ft. 6 in., 4 ft., 4 ft. 6 in., 5 ft., 6 ft., 7 ft., 8 ft., 8 ft. 6 in., 9 ft., 10 ft. Other lengths can be furnished.

A Lifetime Industrial Roof of "Big-Seven" Corrugated Asbestos

Rigid Asbestos Shingles

Asbestos fibres and portland cement are combined under hydraulic pressure to make Johns-Manville Rigid Asbestos Shingles. Since they are made of indestructible materials, they are permanent. They cannot burn; they do not curl, split, crack, or rot; they are easily laid, and, by a judicious use of the many colors and color combinations, they make an attractive roof that will harmonize with any style of architecture.

Johns-Manville Service

Architects are urged to avail themselves of the free service of Johns-Manville's Architects' Service Section for consultation on any roofing problems.

CERTAIN-TEED PRODUCTS CORPORATION

ROOFING DIVISION

Manufacturers of Asphalt Shingles

GENERAL OFFICES

100 East 42nd Street, NEW YORK, N. Y.

For Sales Offices, see page B1752

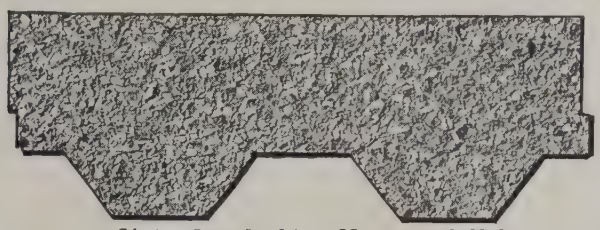
For Plants, see page A433

There Is a Certain-teed Asphalt Shingle for Every Type of Roof

Certain-teed asphalt shingles are made in various types for every roofing requirement. They are built to give the very best service and are guaranteed for 10 years.

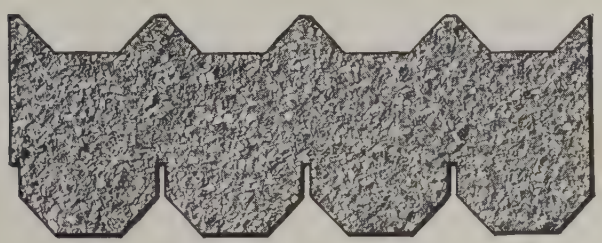
They check and resist fire as they will not support their own combustion, and are proof against sparks and brands. They are fire-resistant as well as weather and water proof. All our shingles carry Fire Underwriters' labels.

They are made of the best quality roofing felt and blended, Mexican asphalts, surfaced with crushed minerals of soft-toned colors. Furnished in red, green, blue-black or color blend; also in attractive assortments of skilfully blended colors.



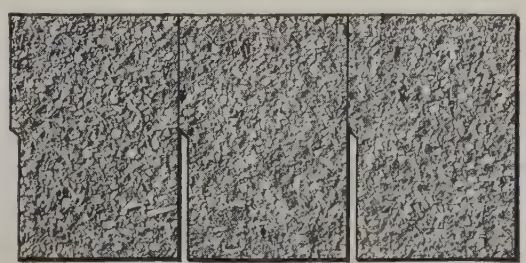
12⅔ in. Interlocking Hexagonal Slab

These slab shingles are self-spacing and interlock at ends. Furnished in an assortment of solid colors and blends of varied colors. Size 12⅔x36 in. Standard weight 215 lb. per square, Jumbo weight 280 lb. per square



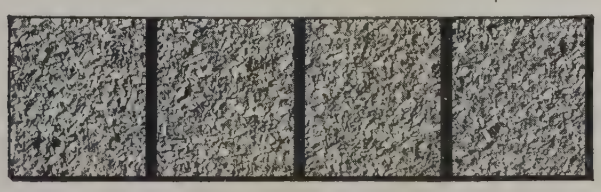
Double-tite Strip Shingle

The only octagon designed shingle giving double thickness and double wear at all points. Furnished in red, green, blue-black and color blend. Size 12x32 in. Standard weight 200 lb. per square



Self-Spacing Individual Shingle

Shingles automatically space and seal slots through our exclusive shoulder design. Furnished in solid colors of red, green, blue-black and assorted blends of beautiful colors. Jumbo weight, size 11x16 in., 325 lb. per square, also in standard weight, 8¼x12½ in., 240 lb. per square, which comes only in red, green and blue-black surfacing



4-Width Strip Shingle

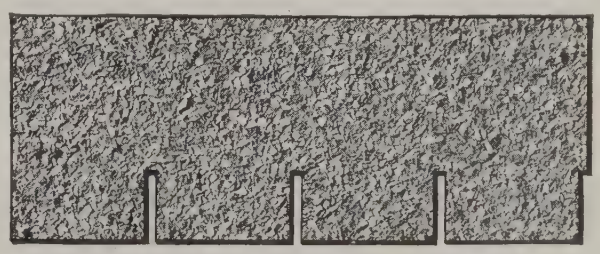
A solid strip creating a maximum weatherproof form of roof covering. Each strip is divided into four shingles separated by ½ in. channels free from surfacing. Furnished in red, green, blue-black and color blend. Standard weight, size 10x36 in., 196 lb. per square, and Jumbo weight, 12½x36 in., 247 lb. per square

13¼ in. Interlocking Hex Slab Shingle

Especially suited for re-roofing over old shingle roofs. Furnished in red, green, blue-black and an assortment of colorful blends. Jumbo weight, size 13¼x36 in., 215 lb. per square

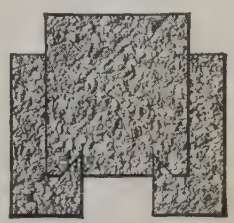
Hexagonal Slab Shingle

The hexagonal type is the only strip shingle permitting the variegated roof pattern so popular today. Furnished in red, green, blue-black and color blend. Standard weight, size 11⅓x36 in., 160 lb. per square, and Jumbo weight, 11⅓x36 in., 200 lb. per square



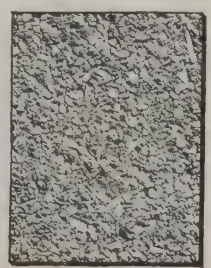
Cut-Out (Square Butt) Strip Shingle

Similar to the 4-Width Strip Shingle except that the slots between shingles are cut out 4 in. deep. Furnished in red, green, blue-black and color blend. Standard weight, size 10x36 in., 196 lb. per square, and Jumbo weight, 12½x36 in., 247 lb. per square



Universal Shingle

Used principally over old shingle roofs. Gives an interwoven thatched effect. An economical quality shingle for single or double thickness roofs. Each shingle is doubly locked in place on the roof deck—they cannot leak, bend up, curl, warp, flap or work loose. Suitable for every type of roof. Size 16x18 in. Weight 132 lb. per square. Furnished in red, green, blue-black and color blend



Individual Shingle

The standard type of individual shingles. Furnished in red, green, blue-black and color blend. Standard weight, size 9x12½ in., 235 lb. per square, and Jumbo weight, 12x16 in., 306 lb. per square

LANCASTER ASPHALT, INC.

Manufacturers of Mastic Slate Surfaced Shingles

GRAYBAR BUILDING, 420 LEXINGTON AVENUE

NEW YORK, N. Y.

A HEAVY BUTT SHINGLE WITH CHARACTER

Lancaster thick butt, tapered and slate surfaced shingles have all the good points of an asphalt shingle combined with the aesthetic appeal of the character, color, shades and blends of genuine slate or heavy wood.

For all roofing purposes, Lancaster shingles have many advantages. They are enduring, strong, slightly flexible and free from the mechanical effect characteristic of all manufactured roofing.

Only High Melt Point Asphalt Used

The mastic is made up of the finest grade high melt point asphalt, fibre and a mineral filler. This mastic is shaped into shingles under great pressure. The surfacing is of slate granules thoroughly embedded into the mastic. The shingles are manufactured by a patented continuous process ensuring uniformity of quality of product. The component materials and the proportioning of same ensure a roof which is practically indestructible.

Irregular, Heavy, Thick Butt—Varying Widths

The heavy, thick undercut butt has a slightly irregular edge adding character to the shingle and enhancing the appearance of the finished roofing with a very heavy shadow line under each row of shingles.

The use of three different widths produces a roof absolutely free of any rigid mechanical appearance.

Lancaster shingles can be used for all pitched surfaces exceeding 4 in. to the foot, and are suitable for schools, residences, churches, clubs, etc. They can be applied directly over old wooden shingles. While the butt is thick, the weight per square is much less than slate or tile.

Fire Resistance and Insulation

They are fire safe and do not splinter or crack when suddenly drenched after being subjected to flame. They have a high insulation value.

Cost

Owing to the advanced method of manufacture, the cost of Lancaster Shingles is very much less than slate, tile or asbestos and less than some grades of asphalt and wood shingles. The price does not fluctuate.

COLORS AND BLENDS

Lancaster Shingles are produced in six different colors and six blends of these colors:

Lancaster No. 1 Green
Lancaster No. 2 Blue Black
Lancaster No. 3 Buff
Lancaster No. 4 Purple
Lancaster No. 5 Light Red
Lancaster No. 6 Dark Red
Lancaster No. 7 Blend of Green, Buff and Blue Black
Lancaster No. 8 Blend of Green and Blue Black
Lancaster No. 9 Blend of Green, Purple and Blue Black
Lancaster No. 10 Blend of Dark Red and Buff
Lancaster No. 11 Blend of Buff and Light Red
Lancaster No. 12 Blend of Dark Red, Blue Black and Buff.

Beautiful effects are obtained by combining several of these colors on the roof.

Burma Red

Jade Gray

Continued on next page

SUMMARY OF CHARACTERISTICS

(1) The shingle is semi-rigid and cannot warp, curl or shrink.

(2) Having a thick undercut butt, this roofing casts a very heavy shadow line.

(3) Being laid in random widths, a mechanical effect is avoided.

(4) Durable; the component parts when mixed are imperishable and will last indefinitely.

(5) Nailing does not fracture this shingle.

(6) Will not lift with wind.

(7) Will stand repeated blows without cracking.

(8) After heating will bend to any desired shape and will retain that shape.

(9) Will stand rough handling.

(10) Affords better insulation than almost any other type of roof.

(11) Fire resisting.

SIZES AND METHODS OF APPLICATION

Sizes and Covering Area

Lancaster Shingles are produced in three sizes:

10 in. wide by 16 in. long
12 in. wide by 16 in. long
15 in. wide by 16 in. long

The covering area (number required for one square) is as follows:

	10 in.	12 in.	15 in.
6½-in. exposure, 3-in. headlap...	222	185	148
7 -in. exposure, 2-in. headlap...	206	172	138

The shingles are laid on the roof in random widths. For a square, mixed sizes, 6½-in. exposure, 60 shingles of each size are required.

The shingles are shipped in bundles, six bundles to the square.

Application

Lancaster Shingles are easily and cheaply applied. Cutting, even in the hottest weather, is readily accomplished by means of an ordinary linoleum knife. For hips and ridges, the shingles may be heated and bent to shape. After cooling they will retain that shape.

SPECIFICATIONS FOR APPLICATION OF LANCASTER SHINGLES

Roofing Felt

All roof boarding (as specified under "Carpenter Work") shall be covered with one thickness of paper or felt and laid in horizontal layers with joints lapped toward eaves at least 3 in. and tacked down.

Flashing

A base flashing course (of 16-oz. copper, 4 lb. lead) extending 4 in. on the roof and not less than 4 in. vertically, shall be laid against all chimneys, parapet and party walls, roof posts and porch roofs where they connect with walls. Similar flashings 4x4 in. by length equal to "weather" plus "lap" laid in with each course of shingles, shall be carried up all rakes.

When base flashings are not covered by shingles or siding, a cap or counterflashing course (of 16-oz. copper, 4 lb. lead) shall be tightly built into masonry at least 2 in. and shall cover the vertical leg of the base flashing at least 3 in. All vertical joints of cap flashings to be sealed tight with elastic roofing cement.

Ridges and Hips

Cover ridges and hips with Lancaster shingles 15 in. wide, bent to shape after slow heating, each ridge and hip shingle to have not more than 6½ in. exposure, to be bedded in elastic roofing cement and be securely nailed by two nails located 2 in. above exposure line.

Open Valleys

Provide 16-oz. soft rolled copper flashing 24 in. wide, nailed at top only.

Closed Valleys

Flash all closed valleys with 16-oz. copper flashing over each course. Flashing shall lap 2 in. and shall extend 12 in. on each side of the valley.

Roof Areas

The main (and porch) roofs, the roofs and sides of dormer windows, and all other surfaces so indicated on the drawing shall be covered with Lancaster Shingles laid 6½ in. to the weather.

The shingle shall project 2 in. at the eaves and ½ in. at all gable ends, and shall be laid in horizontal courses, so that the third course shall lap 3 in. over the first, and each course shall break joints with the preceding one, side lap to be not less than 3 in. The shingle shall begin at the cornice line or eave with a starting course canted $\frac{3}{16}$ in. so that the succeeding courses will contact.

The shingles shall be fastened to the roof boards with broad flat headed galvanized (copper or yellow metal) nails, two to each shingle and of sufficient length to penetrate roof boarding 1 in. Each shingle shall be nailed 9½ in. from the butt.

On completion, all shingles must be sound, whole and clean and the roof shall be left in every respect tight and a neat example of workmanship.

Products

TAPERED ASBESTOS SHINGLES

Mohawk Tapered Asbestos Shingles

Mohawk Shingles are made with a real taper and the butts are available in thicknesses of 3/8, 5/8, and 7/8 of an inch. They are composed solely of pure asbestos fiber and portland cement with mineral oxides for the coloring. The result is a uniting in one product, qualities usually attributed to several.

In the first place they are fireproof for there is absolutely nothing to burn. The asbestos and the cement give exceptional insulation, cooler in summer, warmer in winter. They will not crack, chip or exfoliate —age only improves them. The use of mineral oxides is your insurance for permanency in color. When comparative thickness is taken into account, Mohawk Shingles have the advantage of lightness in weight. No climate is too severe a test for them for these shingles have always met every extreme of heat or cold.

The thick butt gives a deep shadow line and the texture is of an interesting roughness. When furnished with the hand-hewn butts or random widths, a further element for variety and originality is available. The combinations of effects are practically unlimited and Mohawk Shingles can be successfully adapted to any period of architectural design.

Specifications and Method of Application

Made in standard size, 8″ x 16″. Random widths 6″, 8″, 10″, 16″. Laid 7″ to the weather. Not less than 2″ headlap. 260 shingles per square. Ordinary roof construction will carry Mohawk Shingles, as they are lighter than natural slate or tile. Mohawk Shingles, 3/8″ butt average a weight of 650 pounds to the square (100 square feet). Average weight of Mohawk Shingles, 5/8″ butt, 800 pounds to the square; 7/8″ butt, 1300 pounds to the square.

Thickness of butts, 3/8″, 5/8″ and 7/8″. Plain butts and Rustic Colonial type (Rough Butt).

Two sets of *countersunk* holes (4 holes) are provided in Mohawk Shingles, instead of the single set of holes as in all other roofing materials. This enables the Mohawk to be laid securely and regularly, no matter where the boards of the roof come underneath.

The Mohawk Shingle has bevelled edges, insuring a perfect, weather-tight joint.

Roof boards laid in the usual manner, breaking joints and nailing securely, leaving no loose ends. Roofing boards must be well seasoned and preferably of narrow width. Lay one thickness of good quality slater's felt with a 4″ lap, and not less than 10″ lap on hips and valleys. Apply cant strip, lathe or other material 3/8″ thick at eaves. Apply one course of Mohawk Tapered Asbestos Shingles cut 11″ from butt as starters parallel with eaves, overhanging the eaves about 1½″. Apply the second course Mohawk Shingles, covering the first course, breaking joints. Then proceed with laying in precisely the same manner as with natural slate or wood shingles, exposing Mohawk Shingles 7″ to the weather. Use only galvanized needle point nails or copper wire roofing nails as recommended by manufacturer. Drive nails flush with Shingle surface, *but not down too tight.*

PANEL ONE—3/8″ thick butt shingles, Plain. The darker colors are in greater proportion at the bottom, and the lighter colors toward the top, giving a graduated lightening effect.

COLORS—*Brown, Buff, Dark Gray*

PANEL TWO—5/8″ and 3/8″ thick butt shingles, Plain and Rough, random widths. Graduation in color and effect with darker colors and the wider shingles graduating to the lighter shades and narrower widths at the top.

COLORS—*Brown, Purple, Dark Gray, and a few Black*

Continued on next page

The Seven Natural Colors of Mohawk Shingles

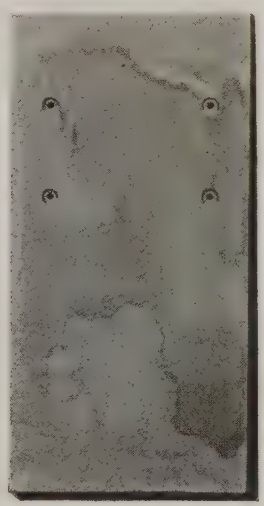
BROWN

PURPLE

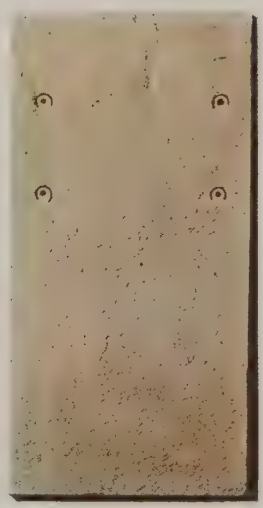
RED

BLACK

BUFF



DARK GRAY



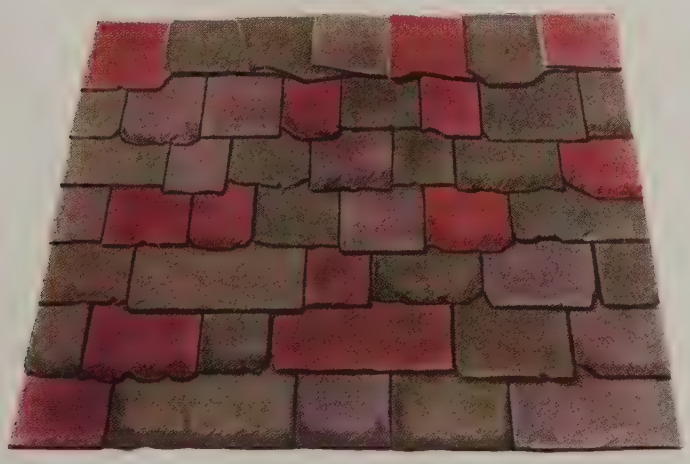
LIGHT GRAY

Hip and Ridge Roll made in all colors in sections 16″ long. Ninety-three sections of Ridge Roll required to cover 100 lineal feet of ridge or hip. Special Hip Tile for hips only laid two pieces to each course, being exposed approximately 4½″ to the weather.

In applying Ridge Roll, use a wood strip one inch by two inches, inch surface to ridge or hip, nailing Ridge Roll to the strip with 3″ lap, using copper clips lapped over the butt of each section.

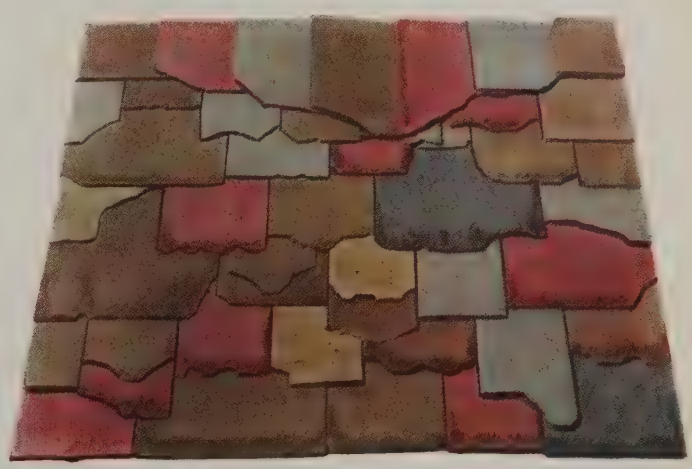
Make all ridges and hips water-tight before applying hip or ridge roll.

Mohawk Tapered Asbestos Shingles are guaranteed to last a lifetime if applied in accordance with our specifications.



PANEL THREE—⅞″, ⅝″ and ⅜″ thick butt shingles. Plain and Rough, random widths. Laid in graduated effect with slightly staggered courses. Beautiful blend of color.

COLORS—*Brown, Purple, Red*



PANEL FOUR—⅞″, ⅝″ and ⅜″ thick butt shingles. Plain and Rough, random widths. Laid in a very irregular manner—tapestry effect. An especially striking treatment over a wide expanse of roof.

COLORS—*Brown, Red, Buff, Dark Gray and a few Black*

THE FLINTKOTE COMPANY

Asphalt Thick Butt Shingles

THE RICHARDSON ROOFING COMPANY

NEW ORLEANS, LA. CINCINNATI, OHIO
NEW YORK, N. Y. BOSTON, MASS.

THE CHATFIELD MANUFACTURING CORPORATION

ATLANTA, GA. DALLAS, TEX.
CHICAGO, ILL.

Products

THICK BUTT SHINGLES.

Also Hexagon and Square Butt Strip Shingles, Super Giant Individual Shingles, Rex Lox Shingles, Roll Roofings and Building Papers, Asphalt Paints, Plastics and Emulsions.

For Asphalt Roofing Products, see page A439; for Anaconda Copperclad Shingles, see page A506.

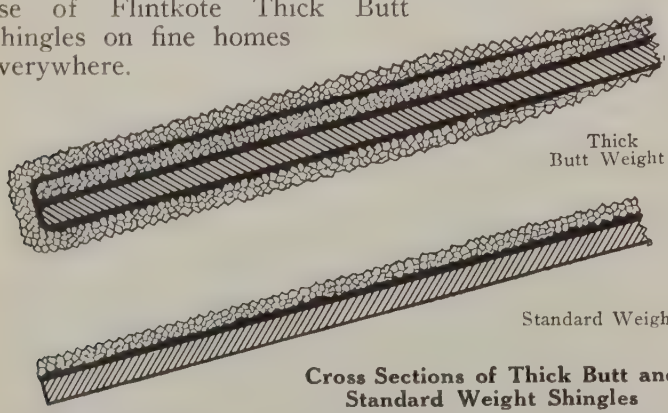
Construction

Thick Butt Shingles are a handmade product. Therefore, they allow distinctive color combinations not available in machine made shingles. Greater thickness and greater texture combined with the many beautiful colors produce a most attractive asphalt shingle roof.

Every exposed part of a Flintkote Thick Butt Shingle is completely protected against destructive elements, by an extra coating of the best protective agent known—*asphalt.* In addition to this sealed sheet of weather resisting asphalt, all exposed edges and the backs of the tabs are protected by an additional wearing surface of crushed minerals.

The *supersaturating process* prolongs their endurance. By this process, an additional amount of asphalt is absorbed into the sheet of felt, bringing the degree of saturation to approximately 100% of capacity. Supersaturation increases the life of the roofing without adding to its cost to the consumer.

The thick-butting process brings to Flintkote Thick Butt Shingles softly rounded contours, an appearance of massiveness, deep artistic shadow lines and all the charm of a hand-wrought roof. These beautiful effects partially account for the growing use of Flintkote Thick Butt Shingles on fine homes everywhere.



Cross Sections of Thick Butt and Standard Weight Shingles

The above comparison of cross sections of a regular shingle and a Thick Butt Shingle show just why Thick Butts offer such substantial protection

Colors

In addition to the standard Flintkote red, green and blue black, the following exclusive hues and color blends assure a shade and color value to exactly suit any home or decorative scheme:

Colordrift
Montauk green
Teaneck brown
Tile red

Designs

10-in. Rex-Tyle Thick Butt Strips—For maximum economy in the substantial thick butt weight.

12½-in. Rex-Tyle Thick Butt Strips—The extra weight and extra headlap furnishes added protection when desired.

12-in. Giant Rex-Tyle Thick Butt Strips—The giant size gives added protection due to its extra heavy construction. Their massiveness especially recommends them for homes of the large or rambling type.

Fan-Tyle Thick Butt Shingles—An unusual shingle which provides a most distinctive and beautiful pattern.

Application

Thick Butts can be applied at the same low cost as other strip shingles. Their scientific design reduces manual operations to a minimum and obtains greater effectiveness from each nail, making fewer nails necessary. Being self-aligning and self-spacing they assure a correctly applied roof. There are no openings between shingles in the strip design to allow wind, rain or dirt to penetrate to the roof boards. They afford greater roof security at a lower application cost.

Fire Protection

The Class C label of the Underwriters' laboratories, Inc., warrants effective safety, not only in resisting fires from without, but in checking fires from within. A Flintkote Thick Butt Roof is safe from flying fire brands and from chimney sparks.

Their distributor and sales representative in your locality will gladly furnish prices, literature, samples and lists of installations upon request, or this material can be obtained direct from The Flintkote Company, Advertising Department, 809 Park Square Building, Boston, Mass.

ESTABLISHED 1870

THE AULD & CONGER COMPANY

Producers of Slate for Roofs, Floors, Terraces and Garden Walks

GENERAL OFFICES
1920 East 75th Street
CLEVELAND, OHIO

QUARRIES: POULTNEY, VT. AND BANGOR, PA.

Products

SLATE for Roofs, Floors, Terraces, Garden Walks, and for Structural Use.

Roofing Slates

Since the establishment of this company in 1870 many thousands of buildings have been roofed with our "Slates of Quality," and many floors, terraces, and garden walks installed. Our Architectural Service Department will gladly furnish samples of our slate and cooperate with architects with suggestions, if desired, as to size, color, thickness, texture, and method of application best suited to the type of building contemplated, all of which are important—taking into consideration location, rafter lengths, surroundings, etc., of the building.

We shall be glad to send you suggested specifications we have formulated for distinctive types of architecture.

Vermont Colored Slates

Our Mammoth Vein Weathering Greens, Purple Vein Slates, Unfading Greens, Unfading Mottled Grays, Unfading Clear Purples, etc., are all well known; as are our "Agecraft Rustics" assembled by us with extreme care to create a charming color-blend roof, we having in mind the necessity of varying the percentages of color exposure for the different lengths of rafters.

Pennsylvania Blue-black Slates

Our Genuine Bangor Slate is famous for its unfading and lasting quality and architects are requested to be careful in specifying as noted below, so that inferior material with some "Bangor" name will not be substituted.

Size—Thickness of Roofing Slate

In Vermont we make all sizes and thicknesses—standard (to average $\frac{3}{16}$ in.), $\frac{1}{4}$, $\frac{3}{8}$, $\frac{1}{2}$, $\frac{3}{4}$ and 1 in.

In Pennsylvania, we make all sizes and standard thickness only (to average $\frac{3}{16}$ in.).

Roofing Slate Specifications

In specifying Genuine Bangor Slate write "Genuine Bangor Slate, the slate to be labeled and with certificate of the Bangor Slate Association," and then see when the material is delivered to the building the slates have this label on them. Otherwise, they are not the Genuine Bangor Slate that you specified. Insist on seeing, too, a certificate sent with every shipment.

For "Agecraft Rustics"

Preparation—Slate roofer shall examine roof boards and advise carpenter of anything likely to be detrimental to the durability of the finished roof, and shall see that any defects are corrected before applying felt. Carpenter shall apply a cant strip nailed about 2 in. above eaves and shall apply saddles back of chimneys and elsewhere required. Carpenter shall also build up forming where curved slate valleys are shown and place all blocking required by roofer. Roofer shall furnish and apply elastic cement wherever necessary.

Felt—Cover surfaces, including dormer cheeks, with asphalt felt weighing 30 lb. to 100 sq. ft., lapped 6 in. where joined (Note A). Where curved valleys are shown felt shall be of double thickness.

Slate—When surfaces are prepared as above, cover with "Agecraft Rustic" Slate, as quarried by THE AULD & CONGER COMPANY, Cleveland, Ohio, the thickness, colors, exposure and method of laying to be as indicated on roof layout prepared by THE AULD & CONGER COMPANY and approved by the architect.

Nails—Copper nails (Note B) of proper length shall be used.

Flashing—Sheet metal contractor shall furnish and roofer shall install 16-oz. soft rolled copper built-in flashings, as required, at closed valleys, chimneys, dormers, and necessary places. Flashing shall extend not less than 4 in. under slate and have not less than 4 in. exposed above the slate on a line at right angle to the roof. Roofer shall insert all aprons required. These to be furnished by sheet metal contractor. Sheet metal contractor shall apply counterflashing and make secure against leaks.

Open Valleys—Shall be 16-oz. soft rolled copper (Note C) 20 in. wide, nailed only at top. When applying slate care must be used that nails do not penetrate sheet metal valleys.

Closed Valleys—Shall be flashed with 16-oz. copper flashing over each course. Flashing to lap at least 2 in. and to extend 10 in. either side of valley.

Rounded Valleys—Are to be carefully fitted and laid with long slate, carefully flashed.

Ridges, Hips—Shall be laid mitered or Boston style if design so requires, ridges and hips shall have 16-oz. copper ridge and hip rolls (Note D) as shown.

Guarantee—Roofer shall furnish guarantee to keep all slate roof surfaces in a watertight condition for one year from completion.

Using Standard Slate in "Agecraft Rustics," etc.

Preparation—Felt Guarantee, same as for "Agecraft Rustics," with necessary modifications.

Slate—When surfaces are prepared as above cover with "Agecraft Rustics" (Note E) as quarried by THE AULD & CONGER COMPANY, Cleveland, Ohio; the colors, exposure and method of laying to be as indicated on roof layout prepared by THE AULD & CONGER COMPANY and approved by the architect.

Specification Notes

Note A: For standard slate we recommend a No. 1 asphalt felt.

Note B: Away from salt air or for less expensive work galvanized or copper-clad nails.

Note C: Substitute zinc galvanized iron or tin, but copper is recommended.

Note D: Substitute 4-lb. sheet lead or galvanized iron.

Note E: Substitute, if desired. Purple Vein, Weathering Green, Unfading Mottled Gray, Genuine Bangor (insert full wording), one size, or random lengths and widths.

The members of the BANGOR SLATE ASSOCIATION are the Sole Producers of GENUINE BANGOR ROOFING SLATE—a blue-gray slate of the highest quality.

Purposes of the Association

The BANGOR SLATE ASSOCIATION is a non-profit membership corporation formed, (1) to bring about a wider appreciation of the real value of slate as a roofing material, (2) to invite the co-operation of architects, contractors and roofers in formulating and disseminating information regarding the most advantageous methods of application, (3) to protect the high reputation and standards of Genuine Bangor Slate. To accomplish these objects, the Association is constantly furnishing to the building world detailed information desired regarding Genuine Bangor Slate.

To insure that the architect obtains slate of a uniform grade and quality, an inspection service is maintained to inspect and label with the trade-mark all Genuine Bangor Slate. In addition, a certificate of quality and grade is furnished to each purchaser of Genuine Bangor Slate.

Service

The Association will welcome the opportunity to co-operate with the architect, contractor and roofer on all roofing problems.

Genuine Bangor Slate

The reputation of Genuine Bangor Slate is so well established that for many years it has been the standard by which other slate has been judged. Without sacrificing tensile strength or hardness, this slate possesses toughness and flexibility to a degree far beyond that of the majority of slates. Genuine Bangor Slate is practically non-weathering, and years of exposure on the roof show no appreciable change in color.

Mill stock for structural purposes, Genuine Bangor Slate Flagging, and Blackboards, are also produced by some of the members of the Association.

(Reg. U. S. Pat. Off.)
Look for Label Bearing This Trade-mark on All Shipments of Genuine Bangor Slate

Label and Certificate Protection

All Genuine Bangor Slate bears the trade-mark of the Association and all shipments are accompanied by a certificate of identification. Genuine Bangor Slate is guaranteed by the Association to conform to rigid specifications for material and workmanship. To insure the protection afforded by this guarantee, architects should insist on only slate bearing the Genuine Bangor label and compel the contractor to furnish a certificate.

This certificate should be checked by the architect, as substitutions of other slate for Genuine Bangor Roofing Slate are common occurrences.

The trade-mark shown has been identified for a generation with the superior slate produced in the Bangor, Pa., district.

Selections of Genuine Bangor Slate

No. 1 Clear—The finest grade of blue-gray slate produced. Uniform throughout as to color and texture, and free from knots and knurls that in any way interfere with the safe conveyance or the laying of the slate on the roof. Entirely clear stock. The customary tolerance to be allowed for thickness. Corners to be square.

No. 1 Ribbon—Similar in all respects to No. 1 Clear stock except that one or more ribbons of darker material may cross the slate in such manner that when laid with the regulation 3-in. lap, the ribbons shall not be exposed to the weather. Fracture tests prove that the ribbon is stronger than the slate.

To Specify Genuine Bangor Slate

Architects who desire Genuine Bangor Slate should specify only by the full name "Genuine Bangor Slate, with labels and certificate of BANGOR SLATE ASSOCIATION." This wording will protect the architect and his client against the substitution of inferior materials.

Small Size of Facsimile Certificate Issued with Every Car of Genuine Bangor Slate

Standard Specification "A"

Preparation of Roof—Before proceeding with roofing work of any nature whatsoever, the roofer shall examine all roof surfaces so intended for the application of slate, and report for correction any and all defects therein which will interfere with the execution of his work and guarantee thereof.

Cant Strip—Carpenter contractor shall provide in place at all eaves a beveled cant strip 1 in. in thickness at the lower side and 2 in. or more in breadth, so beveled that the slate will rest evenly thereon.

Paper—Cover all roof surfaces so intended for slate application with an approved brand of 30-lb. asphalt impregnated roofing felt. This felt shall be laid to shed water and accordingly lapped 4 in. on the rafter and 12 in. where vertical joints are occasioned. It must be in perfect, undamaged condition and free from holes when slate is applied.

Cement—Within 1 ft. of dormers, vertical walls, valleys, ridges, hips and similar places, slate shall be laid in an approved brand of elastic cement approximating the general color of the slate. (Within 2 ft. of the eaves where parapet walls require the use of a copper cricket, slate shall be laid in cement as above indicated.) *Note if required.*

Nails—Each slate shall be secured with two copper slating nails of sufficient length to penetrate the roof sheathing 1 in. in every instance. In no case shall nails be driven through (copper) flashings except when applying same.

Slate—Cover all properly felted roof surfaces as above detailed with No. 1 Genuine Bangor Certificate Roofing Slate (size) identified with certificate and labels of the Bangor Slate Association.

Manner of Laying—All slates shall be laid in proper weathertight manner with well broken joints and preserving a headlap of at least 3 in. above the second course below in all instances.

Valleys—All valleys shall be closed type and shall be properly slip flashed in each and every course. (*Where open valleys are required see foot note below.)* At valley intersections, all courses throughout the entire roof shall meet.

Ridges—Ridges shall be of Boston Type and laid horizontally in such a manner as to form a regular course of slate. There shall be no demarcation between the last course of slate and the ridge course. The holes in the ridge slate shall be punched to intersect the joints of the next course below. It is understood that the top course of slate shall be laid in elastic cement and so arranged that a first class waterproof job will result. In no instance shall the cement be so applied that it will run over face of the slate.

Diagram Showing Method of Laying Boston Ridge

Hips—All hips shall be applied in the Boston Style as per sketches supplied by the Bangor Slate Association, Bangor, Pa.

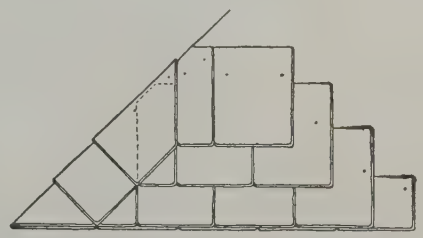

Diagram Showing Method of Laying Boston Hip

Flashings—Flashings on dormer cheeks and where the roof meets other vertical surfaces, shall be of sufficient size to lap 4 in. under the next above and extend 8 in. under slate on each side.

Cleaning Up and Guarantee—The contractor shall guarantee his work for a period of at least ... years, replacing or repairing any broken slates or leaks until the end of his guarantee period. Any stains of any nature whatsoever, excluding stains or dirt streaks caused by other contractors at time of building, shall be removed before acceptance of his work will be granted.

It is not the intent or purpose of the above guarantee to require the roofer to replace slates or repairs, leaks caused by other contractors or by causes beyond his reasonable control. This guarantee refers to faulty slate or workmanship which will not be allowed in connection with the application of this roof.

Note: For abbreviation purposes the following form of specification may be used in place of above: "All materials and labor in connection with slate work shall be furnished and performed in strict compliance with Specification 'A' of the Bangor Slate Association, Bangor, Pa. The slate shall be Genuine Bangor Certificate Slate (grade and size) with labels and certificate of the Bangor Slate Association."

Note: For the sheet metal work we recommend the specifications published by the Copper and Brass Research Association.

Slate on Flat Surfaces

Genuine Bangor Slate for this purpose are applied in small sizes, butt to butt over standard prepared roof surfaces in place of slag or gravel as per specifications issued by the manufacturers of prepared roofing materials.

Copies of such specifications will be mailed upon request.

Olde Stonesfield Flagging.
Thatchslate.
Also Commercial Roofing Slate.

Olde Stonesfield Roofs

Olde Stonesfield Roofs are inspired by the age-old stone roofs of the Cotswold district but offer the added feature of unlimited variety, for in Olde Stonesfield Roofs the greatest range of colors, size, and texture are available and as designed by our Architectural Department fully meet the requirements of the individual building.

Thatchslate

In Thatchslate Roofs, designed and produced by The John D. Emack Co., exclusively, the designer is offered a roof of rich color and texture at a cost between that of an ordinary commercial slate and the more expensive Olde Stonesfield Roofs.

Olde Stonesfield Flagging

Interesting colors and textures in irregular, semi-irregular and random rectangular shapes for inside floors, terraces, walks, steps, coping, etc.

Olde Stonesfield Flagging is also offered cut-to-pattern assuring the designer in advance of the ultimate effect of the work.

Stocks

We carry large stocks of both roofing and flagging for immediate shipment.

Architectural Service

We will be pleased to co-operate with you in the preparation of specifications or designs of roofs or floors, estimating cost or furnishing such information as may be desired.

Continued on next page

Suggested Specifications for Olde Stonesfield Roofs and Thatchslate Roofs

(1) **Roofing**—All sloping roofs (and sides of all dormers), except where otherwise indicated on plans, shall be covered with slate as hereinafter specified.

(2) **Felt**—All surfaces which are to be covered with slate shall first be covered with an approved asphalt saturated felt weight 40 lb. [30 lb.] to the square. Lap well at all joints and fasten with the proper metal clips and nails to the roof sheathing.

(3) **Cant Strips**—At all eaves provide a wood strip of sufficient thickness to give the slate the proper cant. (The thickness of this strip is controlled by thickness of slate at eave.)

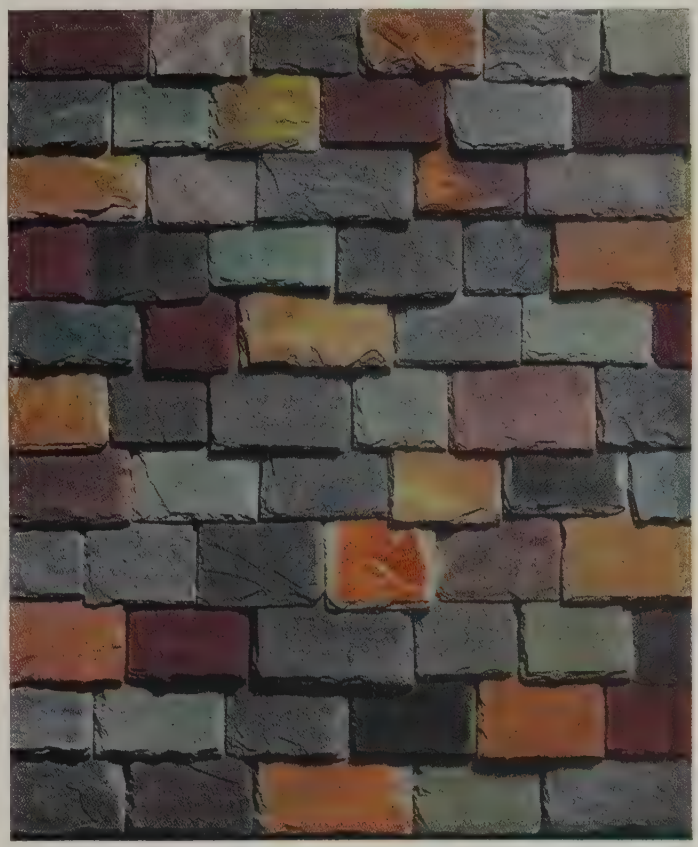
(4) **Slate**—*Note:* Use either paragraph A or B.

(A) Over the felt lay an Olde Stonesfield Roof designed and produced by The John D. Emack Co., Philadelphia and New York. Roof to be laid in accordance with roof layout and instructions furnished by The John D. Emack Co. and approved by architect.

(B) Over the felt lay a Thatchslate Roof designed and produced by The John D. Emack Co., Philadelphia and New York. Roof to be laid in strict accordance with roof layout and instruction sheet furnished by The John D. Emack Co. and approved by the architect.

(5) **Head Lap**—All slate shall be laid with at least a 3-in. head lap.

(6) **Hips and Ridges**—Mitered hips shall be used throughout. Finishing or ridge courses shall be of slate of same average exposure and widths as courses of roof immediately below. No long stretchers are to be used.



Olde Stonesfield Slate, in Full Range of Colors, as Produced from Our Own Quarries

(7) **Valley**—*Note:* Use either paragraph C or D.

(C) All valleys, except where otherwise indicated, shall be round. Carpenter to build valley framing and roofer shall cover with slate in accordance with instructions and working drawing furnished by The John D. Emack Co.

(D) Straight closed valleys shall be used as shown or indicated on the architect's drawings.

(8) **Flashing**—All flashing shall be of copper [lead] [galvanized iron] as specified under sheet metal.

(9) **Nails**—Slate shall be fastened to the roof with copper [re-dipped galvanized iron] nails of sufficient length to penetrate the sheathing at least 7/8 in.

(10) **Cement**—A high grade elastic roofer's cement shall be used liberally in valleys, hips, ridges, at dormers and in any other place where necessary.

(11) **Guarantee**—The roofing contractor shall guarantee all workmanship and material furnished under these specifications free from defects for a period of one year and shall make good at his expense all defects arising within this time.

Suggested Specifications for Olde Stonesfield Flagging.

For (here mention the rooms) floors as well as exterior walks, terraces, and wherever indicated on architect's drawings, furnish Olde Stonesfield Flagging produced by The John D. Emack Co., Philadelphia and New York, in shapes as indicated on architect's plans and in colors as selected and approved by architect.

At left

Detail of Thatchslate Roof
Norman W. McBurney, Architect

The interesting feature of Thatchslate (an exclusive Emack production), as shown on the left, is the exceptional, fine texture that is obtained at a minimum cost and you will note that the exposure of no two slates in any one roof are exactly alike. Thatchslate is not to be confused with material having broken corners as used in imitations

THE CHAPMAN SLATE COMPANY

BETHLEHEM, PA.

Member of the National Slate Association

Products

Makers and shippers of "William Chapman" Black Roofing Slate in all regular stock sizes, also in graduated lengths and thicknesses and random widths.

Quarries

The quarries of The Chapman Slate Company were opened in 1850, and today, with a capacity of over 3000 squares per month, produce more roofing slate than any other single hard vein quarry operating in the country.

The Chapman product today is quarried from a depth of over 200 ft.; is made by highly skilled mechanics, many of whom have long been in the service of the company, and the entire output is most carefully inspected to insure the proper grading.

Heavy "Old English Cleft" Special Rough Slate

Owing to the numerous and constantly increasing demands from architects, the company has, for the past years, been making a heavy rough "Old English Cleft" slate ranging from ¼ to 1 in. in thickness, and in graduated lengths and random widths.

The artistic effect of a roof laid with the genuine "William Chapman" "Old English Cleft" special rough slate gives tone and character to a building which can not be produced by the use of any other roofing material.

For manufacturing plants or other places where particularly hard wear is required, the company recommends the use of "William Chapman" special rough slate, ¼ in. thick.

Standard Roofing Slate

The excellence of the "William Chapman" roofing slate lies in the toughness of the fiber, which is very hard and close grained, thus insuring a durability beyond any known limit of time. "William Chapman" roofing slate absorbs no moisture and will not decompose. Largely owing to these characteristics there is practically no breakage in transportation.

The stock of regular sizes is large and complete.

These slate are about $\frac{3}{16}$ in. thick, weighing approximately 680 lb. to the square, allowing for the standard 3-in. lap.

There are 14 different sizes ranging from 6x12 to 14x24 in. Special sizes will be made to order when required.

Labels

To prevent substitution of inferior quality slate, the company has instituted the practice of labeling about 2% of each shipment of genuine "William Chapman" roofing slate with a label, facsimile of which is reproduced herewith, on which is indicated the grade, whether No. 1 or No. 2.

"William Chapman" Slate Label

Colored Slate

Quotations furnished on colored slate upon request.

Shipping Facilities

The company ships direct from the Chapman quarries to every state in the Union, to Canada and Mexico, or to seaboard for export to Europe or South America.

With the present capacity, any size order for "regular" stock can be supplied promptly.

Experience and Consulting Service

We are distinctly a slate concern: our personal experience in this line covering a period of forty years during which time we have operated quarries in both Vermont and Pennsylvania; making up and supplying slate in all its various forms.

This seasoned experience is available to architects through our consulting service. Our service includes the working out of the most advanced installation problems, supplying of technical facts covering actual quarry possibilities in slate, specification suggestions and lay outs.

Old European Graduated Slate Roofs

Our Old European slate roof is all that modern artistic demands can possibly desire. Marked in texture, graduated in exposures and thickness, random in widths, colors placed haphazard throughout the roof, with more or less departure from symmetry of lines, gives a brief word picture of these beautiful roofs.

Colors range in purples, grays, greens, reds and blacks of varying shades, with some weathering to buffs. A distinguishing color feature of these roofs is the fact that they grow in beauty with age in direct contrast with manufactured roofings.

Cost will vary in range from about that of the ordinary slate roof upwards. Low cost roofs in this line can be worked out to contain some of the attractive features.

For a roof of this character we make up a roof plan outlining each and every course therein, noting the length and thicknesses of every course, thereby making clear the proper placing of laying of the slate. Blue prints furnished as desired.

Old European Terrace, Floor and Garden Flagging

The features of these floors are their pleasing texture and beautiful color effects which are everlasting. The colors are generally purple and green with black, red and buff introduced in such quantities as the individual job requires. The material offers a pleasing texture in its natural quarry surface. The individual pieces are either irregular shapes, varying in size from about 1 sq. ft. to 4 sq. ft.; or square and rectangular. The thickness approximates 1 in., which is sufficient for any purpose.

A Knickerbocker Old European Slate Roof

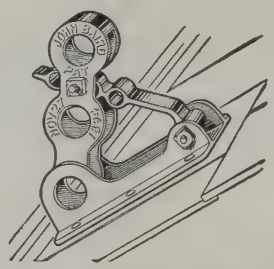
Snow Guards

The patent snow guard standard, in connection with ¾-in. (outside measurement, 1 in.) galvanized gas pipe, composes the "pipe" or "rail" guard. This standard is adjustable to any pitch of roof. The plate is made the thickness of Standard No. 1 slate and of the same dimensions as the slate upon the roof where used, the plate taking the place of a slate and being well secured to the roof with wood screws or otherwise as may be desired.

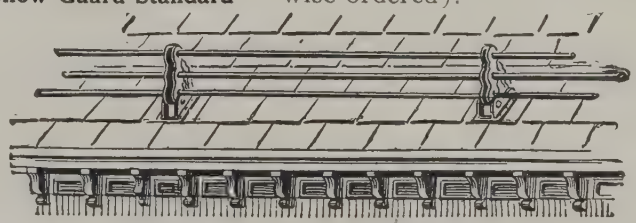
Standards with plates of greater thickness than Standard No. 1 slate will be made to suit heavier slate at an additional charge. Plates will also be made of suitable form for use on tile or other roofs.

Standards are placed along the eaves of all roofs from 5 to 6 ft. apart and are made for 3 pipes.

When ordering, specify the size of slate to be used on the roof (Standard No. 1 thickness is understood unless otherwise ordered).



Snow Guard Standard



Pipe or Rail Guard Complete

Slating Nails

Most slate roof troubles are due to slates falling out because the nails have corroded, therefore cut yellow metal or copper wire nails are recommended.

Our nails are made up and shaped distinctly for slating purposes—the result of many years' experience.

Structural Slate

Furnished in various shapes and sizes for use for steps, platforms, risers, wainscoting, base, toilet slabs of all kinds, floors, electrical slabs, etc. This can be supplied in regular ribbon black, clear black, light green and mottled purple and green.

The light green and mottled purple and green slates present a very fine appearance and are especially suitable for use in entrances, lobbies, stairways, etc., where architectural beauty is desired. They compare favorably with marble but are considerably cheaper.

Slate Blackboards

These are made from the best black slate with the highest grade of machine rubbed finish. Spaces made up of stated dimensions.

ESTABLISHED 1876

NORTON BROTHERS

E. R. NORTON, SOLE OWNER

Manufacturers of Roofing Slate

GRANVILLE, N. Y.

MEMBERS OF

Products

Commercial Standard and Architectural Roofing Slate; Garden Flagging and Floor Slate.

Quarries

The quarries of Norton Brothers were opened in 1876. They are located in the towns of Wells and Pawlet, Vermont, where the finest veins of quality roofing slate exist. All Norton Slate is quarried and produced at these two locations and all shipping is done from Granville, N. Y., where large quantities of standard sizes and colors are available for immediate distribution.

Colors

All kinds of Norton Slate are available in the following colors: weathering green, unfading green, unfading mottled green and purple, purple and green variegated, silver gray green and mottled gray black.

Weathering Green—A commercial sea green which is exceedingly strong and tough and of excellent texture. Upon exposure to the elements some slates weather and are transformed into soft tones of brown, buff and gray while others retain their original shade. This weathering action of the elements serves to beautify a roof of this material and in no way affects the durability of the slate. Most widely known and used Vermont basic slate color.

Unfading Green—A true sea green. Whatever slight fading or weathering takes place is so uniform that a permanently green roof color is assured.

Unfading Mottled Green and Purple—No two slates have exactly the same markings or colors. They consist of slightly varying shades of purples, sometimes almost clear, frequently clouded with spots or traces of green, others with light and dark clouds of purple. Occasionally there are some having only a purplish tint that might otherwise pass for green slate.

Purple and Green Variegated—These slates are of a predominating purple tone, some having spots or streaks of green of varying size. In a small percentage, green may predominate with only tints of purple. Some change upon exposure to harmonious shades of brown, while others present an unchanged appearance.

Silver Gray Green—A unique and beautiful light colored slate. Basicly green with shadings of silver and a darker tone of gray. A semi-fast color product.

Mottled Gray Black—Some are unfading and others weather. Most of the gray slates are mottled by streaks of darker gray and for this reason are often used to advantage with other slates.

These slates will make a very handsome appearance when used for the entire surface, without combining with others.

Commercial Standard Roofing Slate

Because of the great demand for Vermont slate for standard roofing, Norton Brothers have specialized in producing an excellent slate for this use.

The surface is straight and reasonably smooth the full length both front and back. Each slate is free from knots or knurls that in any way might interfere with the safe conveyance or the laying of the slate on the roof.

The corners are reasonably full so that no nailing strength is sacrificed and the roof may be laid watertight.

Made in the standard thickness of approximately $\frac{3}{16}$ in. and in lengths of 12 to 24 in.

Architectural Roofing Slate

The architectural slate can be furnished in various sizes, thicknesses and colors or combinations of colors to specifications. This slate is used extensively by architects and gives a beautiful effect as it weathers. It is of a rougher texture than the standard. Varying shades are frequently used to enhance the color effect, which, with the characteristics just mentioned, add interest in line and texture to the roof design, as well as harmonize with the general character of the building.

We especially recommend Norton's Renaissance, a natural stone slate of rough texture, which has a color-blend feature of unusual merit.

Samples and details gladly sent upon request.

Roofing Layouts and Estimates

Norton Brothers with their 50 years' experience in the layout of roofs for many important installations throughout the country, are prepared to furnish layouts and cost estimates for any style of slate roofing. They also will be pleased to collaborate with architects in the preparation of layouts and specifications.

Garden Flagging and Floor Slate

Made to order or furnished from stock in irregular sizes. Can be furnished with split surface and natural edges, or split surface and trimmed edges. In mixture of colors if desired.

The Company and Its Service

We are generally recognized as the largest individual producers of colored roofing slate and slate products of every kind for both commercial and architectural purposes, from quarries actually owned and operated under our personal supervision and unlimited manufacturing facilities. This fact not only enables us to maintain the uniform quality which has established the superiority of Sheldon's slates, but insures the prompt and satisfactory execution of all commissions entrusted to us.

Exclusive Specialties

Sheldon's Unfading Green and Gray—Separate shades of deep green and light gray, steadfast in color. Can be furnished singly or in such percentage of either color as may be desired.

Sheldon's Unfading Mottled Purple and Green—A mixture of green and purple tones in each individual slate. No two alike. Some with more green than purple—others vice versa—of steadfast color and durability.

Sheldon's Hard Vein Antiques—From rock formations centuries old—of a character that will not permit the manufacturing into slate less than $\frac{3}{8}$-in. thick. The background is green, but the predominating color values of the exposed surface of these slates reflect in light and dark shades of bronze an effect of age such as only the action of time and the elements could create.

Sheldon's Olde English Special Rough Cleft—Furnished in any individual color or combination of colors; random lengths and widths and promiscuous thicknesses ranging from $\frac{3}{16}$ to $\frac{3}{8}$ in. The use of these slates, in accordance with our layout and specifications, guarantees the finest low priced architectural roof extant.

Sheldon's National Black—A strictly high grade Sheldon product. Guaranteed absolutely unfading. Delivered to many localities at a considerable saving in cost over Maine, Peachbottom, or Buckingham.

Sheldon's Slate Flagging—In all sizes, colors, shapes and finishes for interior and exterior uses.

Sheldon's Semi-Weathering Green and Gray Slates

Sheldon's Semi-Weathering Green and Gray are produced from the Sheldon mines in Vermont, the largest in the district, from the deep slate formations of the Cambrian period. A uniform percentage remains unchanged; the balance, upon exposure to the elements, weather to soft tones of brown and buff—all blending together in natural harmony with no suggestion of sharp contrasts.

Prompt deliveries guaranteed. Any size or thickness.

Strength, Absorption and Acid Tests—Made by Cambria Steel Company, Johnstown, Pa., and certified by S. M. Marshall, Engineer of Tests, March 26, 1914, to establish the strength and absorption of *No. 1 Com-*

Sheldon's Slate for Architectural Purposes

All of the slate described, herewith, are available, and are being extensively furnished from the Sheldon quarries, in thickness ranging from $\frac{3}{16}$ to 2 in. (antique ⅜ to 2 in.), and in graduated, or random sizes as desired.

Layout Suggestions for Architectural Slate—

A—20% each 1, ¾, ½, ⅜ and ¼-in. thickness.

B—20% each ¾, ½, ⅜, ¼ and $\frac{3}{16}$-in. thickness.

C—10% 1 in., 15% ¾ in., 20% ½ in., 25% ⅜ in., 30% ¼-in. thickness.

D—10% ¾ in., 15% ½ in., 20% ⅜ in., 25% ¼ in., 30% $\frac{3}{16}$ in. thickness.

Sizes as desired. Lower percentages of thick and higher percentages of thin slate than in graduation "C" and "D" are not recommended. Percentages are based on length of rafter. Heavier slates can be furnished when required up to a thickness of 2 in.

Shipping Weight in Pounds per Square—

Commercial $\frac{3}{16}$ in. 750, ¼ in. 1000, ⅜ in. 1500, ½ in. 2000, ¾ in. 3000, 1 in. 4000, 1¼ in. 5000, 1½ in. 6000.

Waveline Roof

Here is something new—we call it the Waveline roof. Available in Semi-Weathering Green and Gray, Unfading Mottled Purple and Green, and Arabian Red. Applied with standard 3-in. lap, same as the ordinary slate roof. Nominal thickness $\frac{3}{16}$ to ¼ in. Can be furnished in other thicknesses when required.

The Waveline Roof

Sheldon's Olde English Architectural Slate Combination No. 12

As shown below in actual natural colors, consists of a combination of various thicknesses, sizes and colors, designed particularly for producing the finest type of architectural roof after much research and exhaustive experiments.

These slate can be furnished in any range of thicknesses and exposures, either in medium or extremely rough textures with exposed ends straight or irregular. The same combination of colors is also available in random rectangular flagging for flooring, garden walks, etc.

The illustration shows a range in thickness from 1 to ¼ in. with exposures varying from 10½ to 5½ in. The slate are of *medium* texture.

Due to the extent of our quarrying operations and production facilities, timely deliveries are assured. Simply specify—"Roofs to be covered with Sheldon's Olde English Slate Combination No. 12" (following with maximum and minimum thicknesses and exposures) "as manufactured by F. C. Sheldon Slate Company, Granville, N. Y., in accordance with detailed layout to be furnished by them and approved by architect."

Olde English Architectural Slate Combination No. 12

Continued on next page

Sheldon's Heather Combination

A grouping of commercial slates combining attractiveness and low cost. Full beauty is revealed after 4 to 6 months exposure to elements. Roof illustrated is fully matured—commercial thickness, averaging $\frac{3}{16}$ in., exposures 8½ to 4½ in., random widths. Single sizes and all thicknesses available.

Sheldon's Heather Combination

Specify—"Roof to be covered with Sheldon's Slate Heather Combination (state size or sizes, exposures, etc.) as manufactured by F. C. Sheldon Slate Co."

Note: A roof layout for architect's approval should be requested when random lengths are desired.

Sheldon's Olde English Rough Cleft Unfading Arabian Red—Deposits Unlimited

A particularly low priced architectural roof—exclusive and distinctive—steadfast color. ⅜ to $\frac{3}{16}$ in., random widths, varying exposures. Varying thicknesses laid haphazard develop maximum textural effect. Also furnished in standard commercial thicknesses, averaging $\frac{3}{16}$ in. and in regular texture up to 2 in. or heavier.

Specify—"Roof to be covered with Sheldon's Olde English Rough Cleft Unfading Arabian Red (state size or sizes, exposures, thicknesses, etc.)"

"Tudor Stone" Flooring Slate and Garden Flagging.

Tudor Stone Roofs and Flagging

TRADE-MARK

Production

The fact that this company owns and operates numerous quarries in addition to controlling the production of a number of others insures quality and uniformity of result in all slate. This is especially true of architectural slate, which is quarried to order under trained architectural supervision.

Architectural Specialties

"Tudor Stone" Roofing Slate; also the following, which are variations of the *"Tudor Stone"* group: Golden Pheasant, Valenheli, Verde Unique, Yorkshire Gray, Cotswold, *"Tudor Stone, Jr.,"* etc. These are distinct types, not ordinary slate parading under new names, as can readily be seen by comparison.

Commercial Roofing Slate

Sea Green, Unfading Green, Weathering Green, Mottled Green and Purple, Clear Purple, Purple Vein, Rustics, Red, etc., quarried in Vermont.

Genuine Bangor, Albion or Jackson Bangor, Washington Bangor, Franklin, Chapman, Peach Bottom, etc., quarried in Pennsylvania and elsewhere. Monson and Brownville, quarried in Maine. Buckingham, quarried in Virginia.

Flooring Slate and Garden Flagging

Split surface or rubbed surface, trimmed or sawn edges. Irregular shapes, random sizes, rectangular shapes and regular size pieces. In full range of weathering and unfading colors in all thicknesses.

Community Church, East Williston, L. I., N. Y.
George W. Conable, Architect

Samples and Booklet

Samples of any slate desired forwarded on request.

We have booklets and architectural leaflets showing examples of our products. We would be pleased to forward copies of these on request.

Architects' Service Department

The Service Department established in the Architects Building, 101 Park Avenue, New York City, is under trained architectural direction, and is equipped and maintained by this company for the convenience of architects and others who may require information in reference to roof design and construction.

Architects are requested to make use of the facilities offered, either for preliminary work or for the preparation of complete roof layouts and estimates of costs.

This service is rendered without any obligation.

Specifications for "Tudor Stone" Roofing Slate

Preparation—Slating contractor shall examine roof boarding and report to carpenter all defects which would be detrimental to the durability of the finished roof, and shall see that defects are remedied before applying felt.

Carpenter contractor shall furnish and apply a cant strip nailed about 2 in. above the eave line of the slate and shall put water shedding cant strips back of chimneys and up the sides of dormers and where else required. The carpenter contractor shall also build up forming where curved slate valleys are shown and furnish and place all blocking required by roofer.

Roofing contractor shall furnish and apply elastic cement where in his judgment the same is necessary.

Felt—Cover surface to be slated, including cheeks of dormers, with slater's asphalt impregnated roofing felt weighing 30 lbs. to 100 sq. ft. lapped 6 in. at joinings. (See Note 1.)

Where curved slate valleys are shown felt shall be double thickness.

Continued on next page

Slate—All surfaces prepared for slate as above described shall be covered with "Tudor Stone" Roofing Slate, as made by the Rising & Nelson Slate Co., West Pawlet, Vermont.

Thickness, exposure to the weather and character of laying shall be as indicated on roof layout prepared by the Architects' Service Department of the Rising & Nelson Slate Co., under the direction of the architect.

Nails—Nails shall be copper (see Note 4) slater's nails of sufficient length to adequately penetrate the roof boards using not less than 2 to each slate.

Flashing—The sheet metal contractor shall furnish and the slate contractor shall install 16-oz. soft rolled copper built-in flashings as required at closed valleys, chimneys, dormers and other necessary places. Flashing shall extend not less than 4 in. under slate and have not less than 4 in. exposed above the slate on a line at right angle to the roof and shall not be nailed to the vertical surface. Roofing contractor shall insert all aprons required, which will be furnished by sheet metal contractor. Sheet metal contractor shall apply counterflashing and make same secure against leaks.

Open Valleys—All open valleys shall be 16-oz. soft rolled copper (see Note 5), 20 in. wide, nailed at top only. In applying slate, care shall be used that no nails penetrate the sheet metal valleys.

Closed Valleys—All closed valleys to be flashed with 16-oz. copper flashing over each course. Flashing to lap at least 2 in. and to extend 10 in. either side of valley.

Round Valleys—To be carefully fitted and laid with special long slate. No metal used unless specially directed, but care must be taken to preserve continuity of roof color and texture.

Ridges—Ridges and hips shall be of slate laid mitered (or Boston style). If design should so require, ridges and hips should have 16 oz. copper hip and ridge rolls (see Note 6) as shown and detailed.

Guarantee—Contractor shall guarantee to maintain all slate roof surfaces in a water tight condition for a period of 2 years from completion.

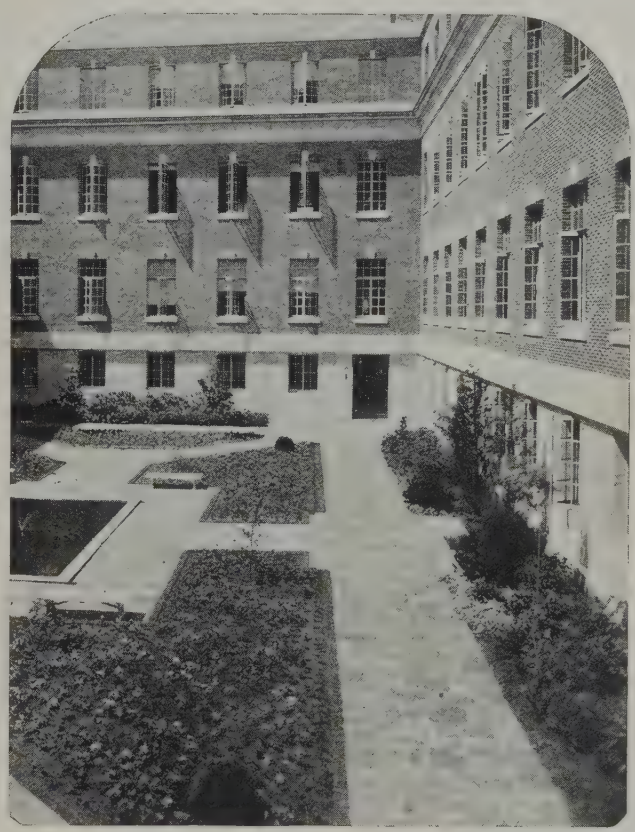
Specification for Plain Hipped Roof with Valleys and Dormers Using Commercial Grade Slate

Preparation, Cement, Felt and *Guarantee* to be specified as described under heading "Tudor Stone" Roofing Slate with such modifications as may be necessary to meet the individual problem.

Slate—All surfaces prepared with felt as above described shall be covered with No. 1 Weathering Green (see Note 2) Roofing Slate, as furnished by the Rising & Nelson Slate Co., West Pawlet, Vermont.

Slate shall be of random widths and 16 in. long (see Note 3); laid with 3-in. head lap so that distance to the weather shall be 6½ in.

Nails (see Note 4), *Valleys, Flashing* and Ridge to be specified as described under heading "Tudor Stone" Roofing Slate.



Courts of Massachusetts Mutual Life Insurance Building, Springfield, Mass.
Olmstead Brothers, Landscape Architects

Specification Notes

Note 1—For best commercial work 30-lb. felt is recommended. For slate not over ¼ in. thick 16-lb. felt may be used.

Note 2—Substitute, if desired, "Tudor Stone Jr.," Weathering Green, Unfading Green, Mottled Green and Purple, Clear Purple, Red or Pennsylvania Slate.

Note 3—Substitute other lengths or uniform widths if desired, but note that commercial slate are made in lengths from 10 to 24 in., always in even inches, and that slate should have 3-in. head lap on second slate.

Note 4—Substitute for less expensive work away from seashore, galvanized iron or copper clad steel nails.

Note 5—Substitute zinc, galvanized iron or tin if desired. Copper is recommended. Curved slate valleys require special attention and when required should be specified to be watertight and of uniform appearance to adjoining slate.

Note 6—Substitute 4-lb. sheet lead or galvanized iron if desired, or specify slated "Boston" hips and ridges or mitered slated hips and ridges. Plumbing specifications should call for 4-lb. sheet lead flashings, 18-in. square, turned up 4 in. around all plumbing pipes, with separate lead cap flashing extended down to the slate and calked into first joint of pipe above the roof.

Specifications for Slate Floors, Terraces and Walks

Slate—The contractor shall furnish and lay all slate for walks, floors and terraces listed below. Slate shall be (here specify color, thickness, surface, size when necessary, shape of pieces, style of edges and width of joints).

On Soil with Grass Joints (Soil or Turf Subbed)—If ground is not well settled, wet and tamp thoroughly. Lay slate directly on soil in (here specify arrangement and pattern). Each piece of slate shall rest on a solid, even bed with the top surface level.

On Soil with Grass Joints (Cinder Subbed)—Mark out location of all walks and terraces to be laid with slate with grass joints and excavate to a depth of 8 to 10 in. Fill excavations with cinders from 6 to 8 in. deep, well rolled and tamped to an even surface. On top of cinder bed place a 2-in. layer of soil and on soil lay slate in (here specify arrangement and pattern). Fill all joints with soil to level of surface of slate and sow grass seed.

On Masonry Slab Laid in Concrete—Place from 1 to 2 in. (depending on final level) of setting mixture (3 parts sand with 1 part of cement). As soon as this setting bed is leveled, sprinkle with pure portland cement to perfect bond between bed and slate and lay slate in (here specify arrangement and pattern.) Thoroughly wet pieces of slate and firmly embed to desired level. Point all joints with concrete mixed 2 parts well-sieved sand and 1 part cement.

Cleaning Slate—(*Note:* Only required for slate floors. with concrete mixture joints). Sponge all slate as set on exposed surface with clean water to remove mortar stains, and, if necessary upon completion, rub down with a solution 3 parts coal oil and 1 part linseed oil. (If light or weak solution of muriatic acid is needed and used for cleaning, care should be taken to wipe only exposed slate surfaces to avoid eating out cement joints.)

Completion—Upon completion, all slate shall be sound, whole and clean; the work shall be left smooth and in every respect a neat example of craftsmanship.

Facilities

The VENDOR SLATE CO. is the largest shipper of roofing slate in the world. Its large concentration yards, warehouses and private railroad sidings permit unsurpassed uniformity of service and efficiency in assembling all orders of any quantity, variety and thickness.

Architects' Service Department

Service departments located at Easton, Pa., and at 101 Park Avenue, New York, N. Y., are under the direction of trained architects prepared to collaborate with the profession on architectural slate roof design and construction. The benefit of their experience is at your disposal without obligation.

Literature

The only catalogue of its kind and size ever published showing all varieties of roofing slate in natural color reproduction. Detailed specifications, pamphlets of all kinds and colored flagging and flooring catalogues. Send for them.

Condensed Classification

Blue Gray—***No. 1 Genuine Bangor Certificate***—Strong, unfading.

Genuine Bangor Ribbon—Similar to No. 1 grade but contains dark streaks under lap.

Genuine Washington Big Bed—Similar in general to Genuine Bangor but of a deeper bluish cast.

Genuine Albion—Good quality but slightly softer, therefore not quite so permanent in color as above grades (for moderate priced construction).

Green—***Verdelite Unfading Green***—Strong and exceptionally defined in color.

Weathering Green—A deeper shade of green, a portion of which changes to various shades of buff, brown and tan.

Sea Green—Similar to weathering green, but the evolutionary colors are more severe including white and yellow.

Clear Purple—A rich deep subdued shade.

Variegated Green and Purple—Each slate contains opalistic streaks of green and purple.

Mottled Purple and Green—Almost entirely purple with occasional green spots. This term is more generally applied to the finished roof containing a mixture of green and purple slates.

Florentine Red—A very subtle and dignified shade.

Standard Sizes of Roofing in Inches

24x14, 24x12, 22x12, 22x11, 20x12, 20x11, 20x10, 18x12, 18x10, 18x9, 16x12, 16x10, 16x9, 16x8, 14x12, 14x10, 14x9, 14x8, 14x7, 12x12, 12x10, 12x8, 12x7, 12x6.

General Specifications

Preparation of Roof—Before proceeding with the roofing work of any nature, the roofer shall examine all roof surfaces intended for the application of slate, and report for correction any and all defects likely to interfere with the correct execution of his work and guarantee thereof.

The carpenter contractor shall set in place at all eaves a cant strip properly beveled, so that the edge thereof is 1 in. in thickness; the depth of the cant strip to be not less than 2 in.

Paper—Cover all roof surfaces intended for receiving slate with 40-lb. asphalt impregnated roofing felt of approved brand. The felt shall be lapped 4 in. on the rafter and 12 in. where ends are joined. It shall be laid to shed water and be in an undamaged condition when the slate is applied.

All slates shall be laid in a proper weathertight manner with well broken joints and preserving a head lap of at least 3 in. over each second course below in all instances. Unless so designated by the specifications, no severely broken or chipped slates shall be used. Occasional slightly chipped corners, however, will be acceptable.

Nails—Each slate shall be securely fastened with at least 2 copper slaters' nails of sufficient length in every instance to penetrate the roof boarding 1 in. In no case shall nails be driven through flashings, except when applying same.

Cement—Within 1 ft. of dormers, vertical walls, valleys, ridges, hips and similar places, slate shall be laid in an approved brand of elastic cement approximating the general color value of the slate. Within 2 ft. of the eaves where parapet walls require the use of a copper cricket, slate shall be laid in cement as above indicated.

Slate—Cover all properly felted roof surfaces so intended with (insert here grade, color, size, etc.) roofing slate as supplied by the VENDOR SLATE CO., Easton, Pa., with their certificates as to kind and quality. (In the case of specially designed Mettowee Architectural Slate Roofs, it should be mentioned that all slate shall be applied in accordance with special layout prepared and furnished by the Architectural Department of the VENDOR SLATE CO. under supervision of the architect.)

Flashings on dormer cheeks and where the roof meets other vertical surfaces, shall be of sufficient size to lap 4 in. under the next above and extend 8 in. under slate on each side.

Cleaning Up and Guarantee—The contractor shall guarantee his work for a period of at least ..... years from the acceptance thereof, replacing or repairing any broken slates or any leaks in the roof until the end of the guarantee of the roof. Any stains or dirt from any cause whatsoever must be removed from the slate before acceptance of his work will be granted.

METTOWEE STONE ARCHITECTURAL ROOFS

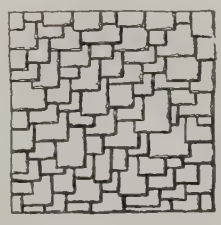
Mettowee Stone Roof Panel No. 36-B (of Bluish Cast)

Composed of an intermixture of 70% standard $\frac{3}{16}$-in. thickness and 30% ¼-in. thickness—a moderately priced architectural roof

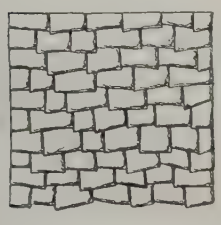
The modified general tone is made so by the inclusion of approximately 30% blue gray slate, particularly Genuine Washington Big Bed, because of its unusual depth of color and variation of surface texture. Equal proportions of permanent and weathering colors are used throughout.

Popular Methods of Application

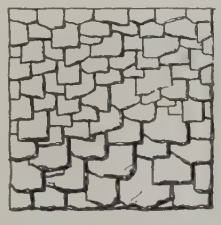
Graduated lengths and thicknesses, random widths



Intermixed lengths, widths and thicknesses with no definite butt line



Irregular butt lines, random widths and thicknesses (of English influence)



Graduated sizes and thicknesses with chipped corners expressing extreme informality

For heavier effects in graduated style the following percentages of thicknesses are suggested:

(A) 20% each 1-in., ¾-in., ½-in., ⅜-in., ¼-in. thicknesses

(B) 20% each ¾-in., ½-in., ⅜-in., ¼-in., $\frac{3}{16}$-in. thicknesses.

(C) 10% 1-in., 15% ¾-in., 20% ½-in., 25% ⅜-in., 30% ¼-in. thickness.

(D) 10% ¾-in., 15% ½-in., 20% ⅜-in., 25% ¼-in., 30% $\frac{3}{16}$-in. thickness.

The loan of your roof plans will enable our Architectural Department to recommend the selection most in harmony with the character of the building and furnish a layout for its application.

Original "Quarry Cleft" Slate (Assorted Texture)

A serviceable roof of modified tone without sacrifice of character

Architectural Roof Design

The Company's organization with over ten years' experience in the layout of roofs for numerous important projects throughout the United States, and its intimate knowledge of the possibilities connected with the slate produced and available in the Vermont and Pennsylvania quarries, is prepared to collaborate with the architectural profession in the preparation of specifications for the artistic roofing of any style of architecture.

A department for this service is maintained at 103 Park Avenue, New York City.

Penrhyn Stone

Penrhyn Stone is the product of a series of quarries operating in the Penrhyn Hills on the border of the State of Vermont.

The wonderful texture and coloring of this material allow harmonious combinations that are adaptable to any type of architecture or period reproduction. The various shades and variegated colorings of purple, gray, green, brown, etc., are so intermingled and weathered that a newly laid roof has all the aged appearance that is characteristic of the roofs on the ancient castles and homes in England.

Penrhyn Stone is produced by skilled craftsmen. It is quarried, split, and trimmed entirely by hand into sizes and thicknesses required by each individual roof, as determined by a study of the architect's plans. Either dark or colorful effects can be produced just as the architect desires or period reproduction demands. The nature of the rock does not admit of being split into commercial thickness and it is, therefore, essentially an architect's slate and especially adaptable to roofs where texture, color, general excellence and integrity of the material itself in addition to the architectural effectiveness, is the paramount object.

Penrhyn Stone Installations

Among the numerous important residences roofed with Penrhyn Stone are the following:

Felix Warburg, White Plains, N. Y., Arnold Brunner, Architect
Roswell Miller, Millbrook, N. Y., Almus P. Evans, Architect

Descriptive Booklets

We issue specifications and illustrated booklets on the use of "Penrhyn Stone" for Architecturally designed graduated roofs, garden walks, interior and exterior floorings and other purposes.

Correspondence is solicited with the Architectural profession during the preliminary stages of any plans where a slate roof is contemplated or will be considered.

Continued on next page

Rough Cleft Architectural Roofs

The growing popularity of the English type of architecture with its diversified effects, in which the slate roof plays a highly important part, has created an entirely new demand in roof architecture. The English cottage in perspective is more than one-half roof and to be an architectural success the roof requires characteristic treatment, and this cannot be accomplished satisfactorily in any material except slate, as variation in color, texture, and thickness is a necessity.

We are producing in Penrhyn Stone an artistic and economical roof in graduated lengths and thicknesses varying from ½ to ¼ in. in an harmonious blend of colors—Rustics, Weathering Greens and Grays, Unfading Greens, Purples, Blacks, etc.—of interesting texture and at a price that is comparable with the cost of the ordinary manufactured roofings.

Rough Cleft Blue-Gray Slate

We are producing a rough textured slate of architectural quality in varying lengths, widths and thicknesses to meet the demand for a dark toned graduated roof.

Penrhyn Stone for Floors, Garden Walks, Garden Seats, Wainscoting, Base, etc.

The wonderful applicability of slate for both interior and exterior effects, with its beautiful and especially effective yet subdued natural colorings, is now fully recognized by the architectural profession.

It has the advantage over other materials in that it can be used with either a rough cleft surface in any degree of roughness desired, or with a rubbed finish similar to a marble tile. The range of colors obtainable is extensive and when carefully selected and blended the result is exceptionally striking and artistic.

The use of slate for terrace and porch floorings in random irregular shapes in mixed colorings is coming more and more into use in America. In Europe, it has been used for centuries—as a reference to illustrations of the floorings and walks of these old structures will testify.

For steps, risers, coping and window sills, slate has many advantages over other materials—it does not absorb moisture, and the colorings can be selected to harmonize with the slate roof.

For stepping stones and garden walks a roughish surface is invariably required by landscape architects, but for terrace and porch floors a comparatively smooth surface (though natural cleft) should be selected so as not to interfere with the free use of the porch furniture.

Where a sub-base of cement is used the thickness of the slabs need not be more than ½ in. but where the Stone is laid in soil a thickness from ¾ to 1 in. is advisable.

The maximum size of the slabs should be determined by the dimensions of the space to be covered—large areas lend themselves to the use of individual slabs of a dimension that could not be successfully used on smaller areas.

Cotswold Stone Roofs

The Cotswold type of English Tudor design with its stone roofs have aroused the enthusiasm of some of our leading architects and reproductions are being designed and specified. To quote a prominent New York architect "the beauty of the Cotswold roofs lie principally in the effect of texture which is brought about by the inequalities of the roof surface; the stone itself is rough on all edges, thick, and laid in courses beautifully graduated in small units." We have made many reproductions using slate instead of stone but we now offer a stone roof of the Cotswold type in interesting tones of Buffs, Rustics, Browns, Grey and Blue in thicknesses of ½ to 1 in. (thicker if desired) and in graduated lengths.

Cotswold Stone Flagging

A natural stone in a variety of subdued colors including Grays, Buffs, Rustics, Browns, Blue, etc.

Cotswold Stone has a very pleasing surface, just rough enough to the foot to prevent slipping when wet which makes it highly desirable for garden walks, steps, curbing for swimming pools and terraces.

Cotswold Stone is supplied in either random sized rectangles or in slabs cut to dimensions as to length and width and in thicknesses from 1 to 3 in.—it is readily cut with a cold chisel to fit any space without breakage.

Suggestions for Installing Garden Walks, Outdoor and Interior Floors

On Soil with Grass Joints (Soil or Turf Sub-bed)—Mark out location of all walks and terraces to be laid with grass joints. If ground is not well settled, wet and tamp thoroughly. Fill any holes or depressions with thoroughly tamped soil, and lay slate directly on soil. Each piece of slate should rest on a solid even bed with the top surface level.

Cinder Sub-bed—Excavate to a depth of 8 to 10 in. Fill excavations with cinders from 6 to 8 in. deep, well rolled and tamped to an even surface. On top of cinder bed place a 2-in. layer of soil and on soil lay slate. Fill all joints with soil to level of surface of slate and sow grass seed.

When Set in Cement—Excavate walks to depth of 6 in., fill in 4 in. with cinder concrete. When this is thoroughly hardened, build up the remaining 2 in. with cement—using a mixture of 3 parts sand and 1 part cement. Grout all joints before cement hardens and point up all joints in color desired.

Stepping Stones—Place stone in desired position on lawn, cut around edge with sharp pointed trowel, lift out sod, remove sufficient earth to permit setting of stone about ½ in. above finished level; tamp well, fill in around edges with earth and sow with seed.

Terrace Floors, Interior Floors, Porch Floors, etc.—Bring rough concrete finish to within 2 in. of desired level for finished floor. Remaining 2 in. shall be built up with cement—3 parts sand 1 part cement. Set each piece of slate separately. Grout all joints before cement hardens and point up all joints.

Slate Roofing, Flooring and Flagging

The product of our quarries is hard, dense slate rock of a degree of quality and color peculiar to the district. The quarried rock is made into roofing slate, slate flooring and garden flagging in our own shops by experienced craftsmen in strict accordance with approved details and specifications.

All orders are executed under our personal supervision, assuring our clients that the years of our experience as slate makers have gone into the preparing of their material for the roof, floor or flagging.

We are also shippers of Pennsylvania and Virginia slate in both commercial and architectural qualities.

Architects' Service Department

We maintain an Architects' Service Department at 101 Park Avenue, New York, N. Y., for the convenience of architects and engineers. This department is at your service for any needed assistance in the use of O'Brien Brothers Slate.

We will gladly prepare sketches, color schemes, specifications, details, etc., for all types of slate roofs, slate flooring and slate for landscape work.

Samples

Small size samples will be mailed free on request. These samples will give the architect or owner general ideas when working out the color scheme of the building.

A Mixed Thickness, Variegated Color, Graduated Length Slate Roof Particularly Adapted to Residence Work

The Standard Thickness, Unfading Green Slate Makes a Fine Roof When There Are Large Expanses, as on Schools or Churches

Colors Obtainable in O'Brien Brothers Slate

Unfading Green—A guaranteed unfading dark emerald green.

Unfading Mottled Green and Purple—This can be had in such combinations as to produce a predomination of either purple or green.

Unfading Gray—A gray-green slate with irregular shaped dark green splotches. Some slate are a solid gray with no markings.

Rustic Gray—A very desirable colored slate to blend with other colors. Dark streaks run through the slate. Some fade to a brown and beautiful buff color.

Vermont Black—Some are a gray-black, while others are real shiny "Niggerhead Blacks." This slate is unfading and used to the best effect in a heavy roof.

Weathering Green—Commercial sea green makes a very durable watertight roof at the least possible expense. After a few months' exposure on the roof some fade to a brown and buff color while others retain their original gray-green color.

Garden Flagging and Flooring—This material can be furnished in all colors and in random rectangular or random irregular shapes. This material is natural cleft and presents a very beautiful surface.

C. G. BOSTWICK

Manufacturers of Snow Guards for Roofs

69 Bartholomew Avenue
HARTFORD, CONN.

Products

"Campbell" Patented Snow Guards for slate, tile, and other steep roofs.

"Campbell" Patented Snow Guards

The "Campbell" is a positive snow guard that stays put and will not break, bend nor wear out. It is made of pure copper only and will last as long as the building upon which it is installed.

An especially valuable feature of the "Campbell" snow guard is that it can be installed on roofs already laid, without breaking or removing slates.

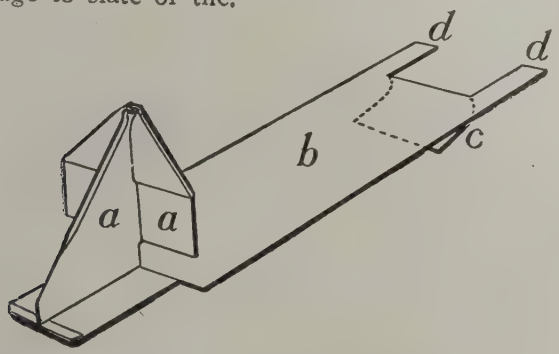
Construction Details

The snow stop or guard head (a) is so designed and constructed that it can not bend or collapse under the weight of the snow or ice.

The broad, flat, thin supporting strap (b) gives a distributed bearing, does not lift the slates and positively will not cause them to break.

The hook end (c) on the supporting strap is broad and will not split nor injure the slates and stays put.

The fingers (d) on the hook end are designed for quick and easy installing on roofs already slated without damage to slate or tile.



Number of Guards to Set, Per Square

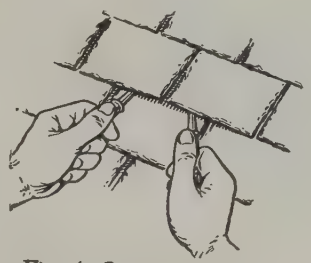
This varies according to the size of the slates, pitch of the roof and special needs.

For graduated, random slate roofs, space the guards from 16 to 24 in. apart horizontally and so spaced up and down as to properly stagger in alternate courses. The following table is worked out by this method:

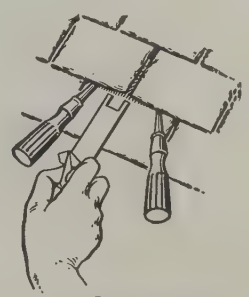
Size of slate, in.	Guards required per square	Where to place guards	
		Horizontally	Perpendicularly
12x6	60	Every 3rd slate	Every 3rd course
12x7	50		
12x8	40	Every 2nd slate	Every 5th course
14x7	45	Every 3rd slate	Every 3rd course
14x8	40		
14x10	35	Every 2nd slate	Every 4th course
16x8	30	Every 3rd slate	Every 3rd course
16x9	60		
16x10	55		
16x12	45		
18x9	50		
18x10	45		
18x12	40	Every 2nd slate	Every 2nd course
20x10	40		
20x12	35		
22x11	35		
22x12	30		
24x12	30		

Directions for Installing

The only tools required are two screwdrivers. Push a screwdriver under the butt of the slate at each side of the joint where the guard is to be installed. Then



First Operation



Second Operation

Finished and in Place

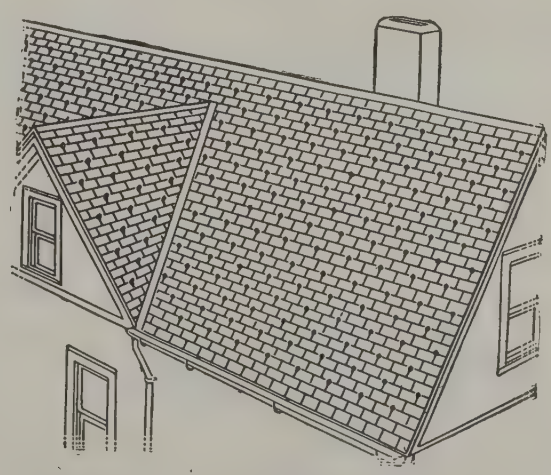
push the guard into place, remove the screwdrivers and continue with the succeeding guards in a like manner.

If the guards are securely hooked on the slates no staging will be required after the first course has been installed.

Start installing at the eaves and work up to the ridge, using the guards as a foothold to work on. However, as a precaution, it is well to have a rope or plank.

Architects' Specification

Install "Campbell" Patented Snow Guards, as manufactured by C. G. Bostwick, Hartford, Conn., spaced not more than 24 in. nor less than 16 in. apart, and so spaced up and down that they will properly stagger in alternate courses.



Spacing of Snow Guards on Typical Roof

CLASON WIRE SNOW GUARD FOR ROOFS

Manufactured Only by
THE M. N. CARTIER & SONS CO.
Cartier Building, 275 Canal Street
PROVIDENCE, R. I.

Product

WIRE SNOW GUARDS for slate, tile, metal and other steep roofs.

Their Purpose

To lessen chances of damage suits against owners of property by increasing both personal and property safety.

There are many buildings so situated that the use of snow guards is essential to personal safety; there are more cases where the use of snow guards could protect the surrounding roofing and sheet metal work against costly damages.

Sliding snow and ice often injure roofings, and puncture or tear away gutters, etc. The use of our snow guards forestalls these dangers, as they hold the ice and snow where they form. They are a cheap and unobtrusive preventive against damage.

Important Notation

We note a growing tendency to permit the installation of three, four, or five courses of snow guards near the roof eaves. The result is that a few guards are compelled to hold not only the weight of snow and ice which they are located to care for, but also to withstand the tremendous tearing force of slides starting from the roof surfaces above.

No guards will withstand such conditions, and their installation in such a manner precludes the *purpose* for which they are used. When specifying our guards please do so according to our table and *insist* upon the roofer following the specification.

Manufacture

We make our guards in our own plant, and are not dependent upon the facilities or services of others.

These guards are manufactured either from pure copper wire or galvanized steel wire, both selected for ductility and stiffness. No copper-covered steel wire is used.

Practicality

Our wire snow guards combine strength, long service, economy and unobstructive design.

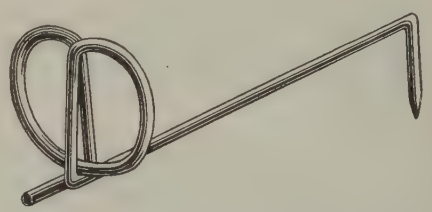
Types of "Clason" Snow Guards

New roofs, 1 and 2-in. points.
Hook and friction for old roofs.
Solder-to-metal-roof.
Special for Spanish tile.
Special for asbestos shingles.

The "Clason"

The "Clason" has been for years the standard guard, and is the strongest guard made.

Note from the illustration that the "butterfly" loops brace and strengthen each other, while the extension brace lends additional strength.



"Clason" Snow Guard for New Roofs

Number Per Square

The following table gives the approximate number of snow guards which may be safely specified for use in each 100 sq. ft. of roof surface:

ROOF PITCH	NUMBER OF GUARDS
One-quarter	50
One-third	75
One-half	125

Towers, and steeper roofs than above indicated, may require special consideration.

How to Specify

Apply to all pitched roofs "Clason" [for old roofs "Clason Special"] Snow Guards, as made by THE M. N. CARTIER & SONS CO., Providence, R. I. The guards to be made from pure copper [galvanized steel] wire. (Here specify the number of guards required per square, dependent upon the pitch of the roof and other special conditions.)

In applying the snow guards, the eaves course of the roofing material shall be laid as usual, but the next course shall be laid with the joints slightly open to receive the shank of the snow guard.

After striking the line for the third course of the roofing material, place the guards in the joints, with the loop just below the lap of the course, and drive the prong into the roof decking; then lay the course, leaving only the loop exposed.

Care must be used to insure having the shank well sunk into the joints, so that the following course of roofing material will lie flat and not bear upon the guard.

(*Note:* The architect or engineer may omit at his discretion the method of application of the guards.)

DAVID LEVOW

"Fitrite" Adjustable Pipe Snow Guards (Malleable Iron or Bronze) and "Fitrite" One-piece Ornamental Leader Straps (Copper or Zinc)

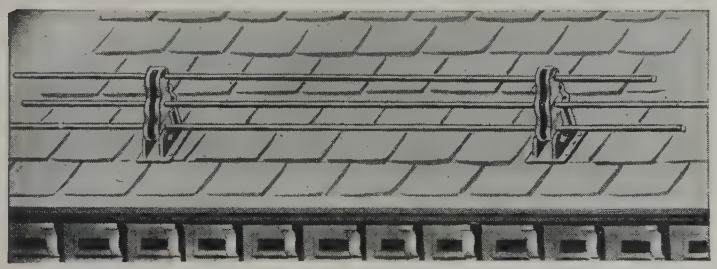
TELEPHONE
CHELSEA 2400

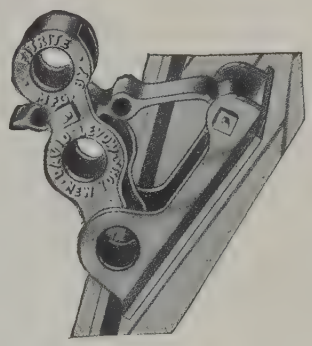
542 West 23rd Street
NEW YORK, N. Y.

For Skylight Gearing and Bronze Strainers, see page A1314

"Fitrite" Adjustable Pipe Snow Guards

Adjustable to four positions. Fits any slate roof of any pitch. To be used with 2 or 3 galvanized iron pipes ¾-in. iron pipe size.





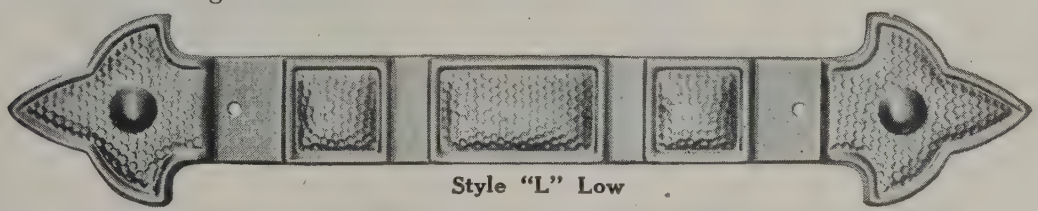
Instructions—Place "Fitrite" Snow Guards along eaves of roof 5 or 6 ft. apart. Plate takes the place of a slate and is fastened with wood screws or nails.

Material—Made in galvanized malleable iron or bronze.

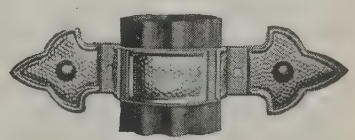
Size of Plates—Made in any size for standard No. 1 slate. Can be made with thicker plates at additional charge. Unless otherwise specified, standard No. 1 plates will be supplied. Also made for Spanish tile and special design shingles.

"Fitrite" One-piece Ornamental Leader Straps

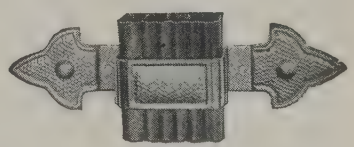
Material—Made in copper for copper leaders, and zinc for zinc or galvanized leaders.



Style "L" Low



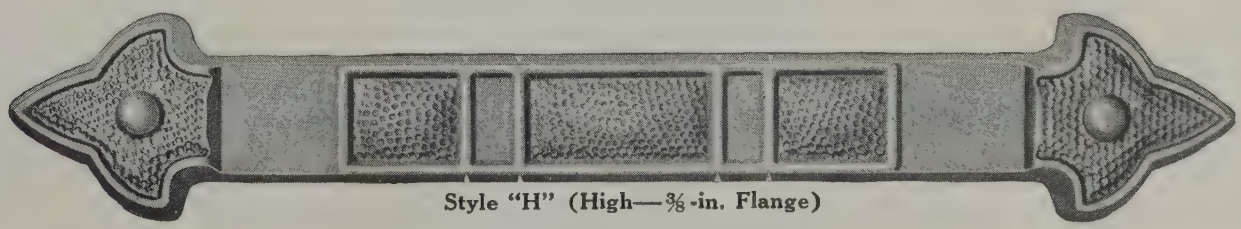
Same Strap Used for Round Leader



Same Strap Used for Square Leader

Style "L" (Low)—Style "L" (Low) made of heavy gauge metal strong enough to hold leader without hooks.

Sizes—
2 in. for 2-in. round or square corrugated pipe (1¾x2¼ in.).
3 in. for 3-in. round or square corrugated pipe (2⅜x3¼ in.).
4 in. for 4-in. round or square corrugated pipe (2¾x4¼ in.).



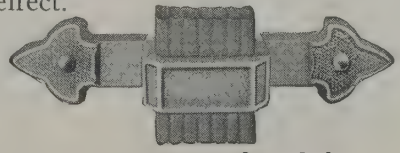
Style "H" (High—⅜-in. Flange)

Style "H" (High—⅜-in. Flange)—Style "H" (High) made in 16-oz. copper or No. 11 gauge zinc. Can be used with or without hooks. When hooks are used, tinsmith slits edge of strap and bends at desired point, allowing for proper distance from leader to wall of building.

Sizes—
2 in. for 2-in. square corrugated pipe (1¾x2¼ in.).
3 in. for 3-in. square corrugated pipe (2⅜x3¼ in.).
4 in. for 4-in. square corrugated pipe (2¾x4¼ in.).

Features—Both styles of strap are shipped flat. They can be bent or formed by hand on the job and require no soldering.

Design and deep stamping produce artistic hand-hammered effect.



For Square Leaders Only

COPPERCLAD SHINGLES

MANUFACTURED BY THE ANACONDA COPPERCLAD COMPANY

GENERAL DISTRIBUTORS

THE FLINTKOTE COMPANY

THE RICHARDSON ROOFING COMPANY
NEW YORK BOSTON CHICAGO

THE CHATFIELD MANUFACTURING CORPORATION
NEW ORLEANS CINCINNATI ATLANTA DALLAS

Products

HEXAGON COPPERCLAD SHINGLES.
STANDARD COPPERCLAD SHINGLES.
THICK BUTT COPPERCLAD SHINGLES.

Also Asphalt Shingles, Roll Roofings and Building Papers, Asphalt Paints, Plastics and Emulsions.

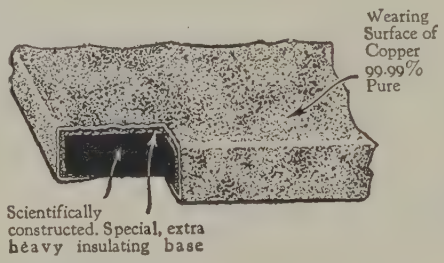
For Asphalt Roofing Products, see page A439; for Thick Butt Shingles, see page A484.

The Reason For Copperclad Shingles

Only a small part of the thickness of 16-oz. sheet copper is necessary for ample protection against wear from the elements. The remaining thickness is required for mechanical strength.

Copperclad shingles present to the elements a sheet of copper several times thicker than the minimum requirements for wear.

The mechanical strength necessary for roofing material is provided by a specially prepared base which not only is less expensive than copper but possesses superior qualities for this purpose.



Asphalt was selected for this base because of its peculiar suitability. In the refining of copper, asphalt has been used for many years because there is no chemical reaction when copper and asphalt are intimately associated. For this reason asphalt is an ideal base for copper roofing.

The insulating qualities of this combination have resulted in an improved type of copper roofing especially adaptable in design to general residential work.

Copper, through the economies effected in Copperclad, is now a moderately priced roofing.

Copperclad is copper to the eye, to the touch and to the weather.

Manufacture

The copper is electrolytically applied by the Anaconda Copperclad Co., Rutherford, N. J., a subsidiary of the Anaconda Sales Company and of THE FLINTKOTE COMPANY.

The special base is made by THE FLINTKOTE COMPANY. The result is a long life shingle of great strength.

Recommended Uses

Copperclad Shingles can be used where the roof pitch exceeds 4 in. to the foot. They are suitable for residences, churches, schools, hospitals and other buildings where permanency, Class A fire protection, waterproofness and beauty are required of a roof.

Reroofing Over Old Shingles

Copperclad can be applied directly over old wooden shingles. Applied in this way or to the roof boards after the wooden shingles have been removed, Copperclad makes a permanent roof of long life and lasting beauty.

Cost

The cost of Copperclad is about one-third to one-half the cost of a sheet copper roof. It is less expensive than a good grade of slate or tile, and only slightly more expensive than the best asphalt or wooden shingles.

Life

Time has proven copper to be one of the best and most enduring of all roofings. Copperclad is copper roofing in its purest and most practical form. Copperclad Shingles are guaranteed for twenty years against defective material or manufacture without reservation of any character whatsoever.

Beauty

Copperclad Shingles are supplied in natural copper color. They will oxidize and color to the natural soft tones so characteristic of other forms of pure copper.

Fire Resistance

Standard Copperclad Shingles carry the Class A label of the Underwriters' Laboratories, Inc. They are the only shingles on the market which do not require a layer of asphalt saturated asbestos felt underneath to receive Underwriters' Class A label.

Application

Copperclad Shingles are applied in overlapping units as shown in illustrations. They lay rapidly. There is no waste from breakage.

Large head copper nails should be used—1-in. length over roof boards, 1½-in. length over old wood shingles.

Nails per square: Hexagonal, 304; Standard and Thick Butt, 360.

Number of units per square: Hexagonal, 76; Standard and Thick Butt, 90.

Weight per square: Hexagonal, 211 lb.; Standard, 234 lb.; Thick Butt, 294 lb.

Use copper nails, flashings and valleys throughout.

No allowance necessary for expansion or contraction.

Specifications

Hexagonal Copperclad Shingles, Standard Copperclad Shingles and Thick Butt Copperclad Shingles are laid in accordance with the instructions contained in bundles.

How Obtainable

Nine thousand distributors of THE FLINTKOTE COMPANY, The Richardson Roofing Company and The Chatfield Manufacturing Corporation are in a position to furnish Copperclad Shingles. Prices, literature, samples, listed installations and names of local dealers are obtainable from any of the offices of the above companies.

Spanish Metal Tile
All the charm of the spanish tile made practical in metal. May be painted in any color desired

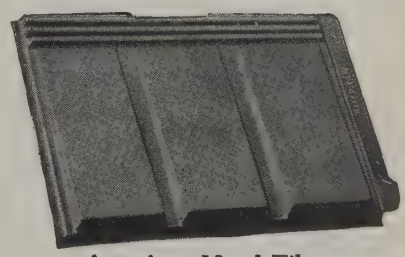
Metal Tile Roofing

Ideal for all types of residences and for the visible portions of roofs of apartment buildings, hotels, churches, theaters, hospitals, schools, libraries and other public buildings, railway stations, garages, filling stations, etc.

Provides a watertight, stormtight, lightningproof, fire-safe roof that is economical, light in weight, very durable and architecturally beautiful.

Available in Anaconda copper, pure zinc, steel, "coppered metal," or rust-resisting Armco Ingot iron.

Ingot Iron



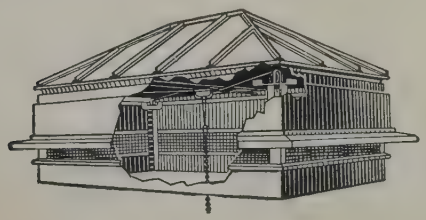
American Metal Tile
A pleasing style, heavily ribbed, to produce desirable shadows. Practical, safe, good looking. Paint any color desired

Ventilators and Skylights

From stationary ventilators of the most simple type, to ball bearing revolving syphon type ventilators (Alpinas) the Milcor line embraces efficient ventilation units for all types of buildings including offices, apartments, residences, etc., up to the larger buildings and industrial plants. Also barn ventilators of special design.

Ventilating skylights and all standard types of skylights (puttyless or puttied) are available in the Milcor line.

Milcor "NuAir" Ventilators possess great exhaust capacity and strength. Designed so as to absolutely prevent downdrafts. Made in standard sizes from 10 to 48 in. Write for specifications.

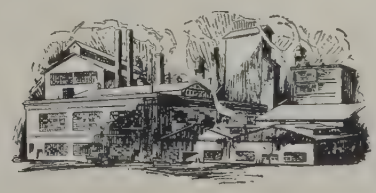


Metal Ceilings and Walls
Milcor "Invisible Joint" metal ceilings and walls need no introduction. 288-page catalogue No. 26 is ready. Write for it. Write for important new Milcor development in ceilings.

Sheet Metal Products for All Types of Buildings

For industrial buildings, office buildings, skyscrapers and all types of homes and other buildings, Milcor Sheet Metal Building Products are available. For interior requirements and for exterior needs these products are designed to give the maximum of service.

Whether it be ordinary flat sheets for air ducts, ventilating systems, cabinets, chutes, etc., or corrugated sheets for roofing or other purposes, or architectural sheet metal cornices, marquises, style roofing, etc., or metal lath and allied products, or rain carrying equipment, or warm air heating equipment, look to Milcor for advice and service.



ALUMINUM COMPANY OF AMERICA

Manufacturers of Aluminum Roofing

PITTSBURGH, PA.

Oakmont (Pa.) Country Club
Aluminum shingles applied over old wood shingles

Products

ALUMINUM SHINGLE ROOFING consisting of Top-Down Aluminum Shingles, Flashings, Hip and Ridge Coverings, Valleys, Gutters, and Down-spouts; together these form a complete, non-corrosive, durable, lightweight roofing job.

For Aluminum and Aluminum Alloys, see page A850; for Aluminum Paint, see page B2034.

Application from Top, Down

Aluminum shingles possess, exclusively, the unique advantage of being laid from the top, down. Start at the ridge pole and finish at the eaves.

Top-Down Aluminum Shingles

Top-Down Aluminum Shingles come in plain and ribbed patterns. They are fabricated from No. 24 B&S. gauge (.0201 in.) aluminum sheets. Their size is 10½x16¾ in., over all. In a completed roof, there is no exposed nailing, and an air space under each row of shingles permits the drying of condensed moisture and gives a desirable insulation.

Colors

Top-Down Aluminum Shingles come in natural aluminum finish, which weathers to a soft, silver-gray tone and in four standard colors—light green, dark green, gray, terra cotta red. Special colors may be had if desired. The paint is sprayed on—a kind of paint made especially for the purpose being used.

Advantages of Aluminum Shingles

Resistance to Corrosion—Aluminum shingles resist the effects of moisture, salt-laden air, sulphur, sulphuric acid fumes, certain organic acids, and other corrosive agents found in the atmosphere.

Light Weight—Top-Down Aluminum Shingles weigh, when applied, approximately 60 lb. per square (100 sq. ft.), which is considerably less than the weight of other roofing materials in general use.

Durability—Top-Down Aluminum Shingles are durable because they resist corrosion. They are durable because thick metal (.0201 in.) is used in fabricating the shingles and the resulting rigidity minimizes possible damage from snow, hail, ice, tree branches, falling bricks, etc. Extreme cold will not make aluminum shingles brittle. They will retain their strength, rigidity, toughness, and ductility in all kinds of weather.

Easily Worked—Top-Down Aluminum Shingles are easily bent and cut without cracking and, once formed, they hold their shape. This speeds up the work and cuts the cost of application.

Pleasing Appearance—The appearance of an aluminum shingle roof is attractive because of the pleasing colors and its pronounced relief. The ⅝-in. butts and heavy vertical ridges give a much desired light-and-shadow texture.

Non-staining—Aluminum forms no colored salts, and, consequently, it will not discolor adjoining materials from drip or splash of watershed.

Weathertight—Weather sealing and expansion and contraction are taken care of in aluminum shingle construction. A roof with a pitch as low as 3 in. to 1 ft. is practicable with aluminum shingles.

How Top-Down Aluminum Shingles Are Laid

Top-Down Aluminum Shingles are laid 8x16 in. to the weather, giving 1½-in. horizontal and ¾-in. vertical interlocking joint connections with complete provision for expansion and contraction, drainage, and water seal against capillary attraction. The height of the butt is in each 8-in. multiple alternately ⅝ and ½ in. This alternating thickness of shingle butts gives a broken butt line to accomplish heavy definite light and shadow lines. 112½ full size 10½x16¾-in. aluminum shingles are required to lay one square (100 sq. ft.), of completed roof surface.

One-third pound of 1-in. aluminum roofing nails is required to lay one square of aluminum shingles on a new roof and one-half pound of 1½-in. aluminum nails to re-roof over a wood shingle roof.

Other Aluminum Roofing Materials

In addition to shingles, aluminum roofing materials are also available in the form of corrugated sheets, standing seam, and other standard forms of roofing.

How to Specify Top-Down Aluminum Shingles

All roof surfaces shall be covered completely with full-size aluminum shingles, three-quarter size starter shingles, eaves-finishing strips, right and left-hand side finish-pieces, valley sheets and valley flashing, ridge cover and ridge flashing, hip cover and counterflashing, around all walls, chimneys, etc., as required to produce a roof of proper mechanical construction in accordance with the manufacturer's standard application instructions, a copy of which will be sent at your request.

Sheathing—All roof sheathing shall be good common boards of equal thickness laid horizontally or diagonally without open joints and securely nailed and properly spaced to insure secure nailing.

Entire roof sheathing shall be covered with 15-lb. asphalt saturated felt, lapped 2 in. and secured with 1-in. aluminum roofing nails.

Note: No felt is required when laying aluminum shingles over wood shingles.

All aluminum shingles and flashing shall be fastened with aluminum nails. Boards of ⅞-in. thickness are required for properly applying hip and ridge covers.

ANACONDA SHEET COPPER, ROLL COPPER and ECONOMY STRIP COPPER.

For Anaconda Extruded Architectural Bronze Mouldings, etc., see pages A852-853; for Anaconda Brass and Copper Pipe and Anaconda Copper Service Tubes, see page C2701.

Quality of Anaconda Sheet Copper

Anaconda Sheet Copper is 99.9% pure, and guaranteed by THE AMERICAN BRASS COMPANY, the world's largest and most experienced manufacturers of copper and brass products. Manufacturing processes, developed during more than a hundred years of practical experience, insure uniform temper and accurate gauge.

Copper in a More Convenient Form

For valleys, flashings, gutters, rain-pipes, gutter linings and similar purposes, THE AMERICAN BRASS COMPANY has developed Economy Strip Copper.

This product is furnished perfectly flat, with edges parallel, in lengths of from 5 to 10 feet, inclusive, widths of 6 to 16 inches, and in 16-ounce weight. Economy Strip Copper is correctly tempered for forming. Its use eliminates the labor cost of flattening, cutting and trimming standard sheets. In addition, because of standardized production in large volume, Economy Strip Copper costs less than standard sheet copper.

Economy Strip Copper Is Trade-marked

As a permanent mark of identification, every length of Economy Strip Copper (Trade-mark Reg. U. S. Pat. Off.) carries the Anaconda trade-mark rolled in the metal. This mark is an assurance of full weight and a guarantee of 99.9% pure copper.

Anaconda Service is Nationwide

Large stocks of Anaconda Copper Sheets, Rolls and Strips at Ansonia, Conn., Buffalo, N. Y., Detroit, Mich. and Kenosha, Wis., enable distributors to meet any unusual requirement. The convenient location of these shipping points means prompt service and a saving in freight.

RECOMMENDED SIZES AND WEIGHTS OF COPPER FOR SHEET METAL WORK

Anaconda Economy Strip Copper should be used for all purposes where the required width does not exceed 16 inches. Where the required width exceeds 16 inches Anaconda Standard Sheet Copper should be used.

Purpose	Designation	Temper	Weight, oz.	Sizes	Number strips packed to crate	Area or length covered
Roofs	Flat seam	Soft	*16	14 x 20-in.	112	180 sq. ft.
				10 x 14-in.		82 sq. ft.
	Standing seam	Soft	*16	20 x 96-in.	25	284 sq. ft.
				30 x 96-in.		448 sq. ft.
	Ribbed seam	Soft	*16	20 x 96-in.	25	284 sq. ft. outside of battens
				30 x 96-in.		448 sq. ft. outside of battens
				6 in. x 6, 8, or 10-ft.	25 or 50	50 lin. ft., 8 sq.ft. for 2 x 3-in. ribs
Flashings and Gutter Linings	Base	Soft	*16	12, 14, 16, or 18-in. x 6, 8, or 10-ft.	25 or 50	150, 200, 250, 300, 400 or 500-lin. ft.
	Cap	Soft	*16	10 in. x 6, 8, or 10-ft.	25 or 50	150, 200, 250, 300, 400 or 500-lin. ft.
	Valley	Soft	*16	18 in. x 6, 8, or 10-ft.	25 or 50	150, 200, 250, 300, 400 or 500-lin. ft.
	Gutter linings	Soft	*16	12, 14, 16, or 18-in. x 6, 8, or 10-ft.	25 or 50	150, 200, 250, 300, 400 or 500-lin. ft.
	Shafts	Soft	*16	12, 14, 16, or 18-in. x 6, 8, or 10-ft.	25 or 50	150, 200, 250, 300, 400 or 500-lin. ft.
	Skylight base	Soft	*16	12, 14, 16, or 18-in. x 6, 8, or 10-ft.	25 or 50	150, 200, 250, 300, 400 or 500-lin. ft.
	Window heads, etc.	Soft	*16	6 or 8-in. x 6, 8, or 10-ft.	25 or 50	150, 200, 250, 300, 400 or 500-lin. ft.

Note: For flat seam roofs use 4 cleats to each sheet with 2 nails to each cleat.
For standing seam roofs use 9 cleats to each sheet with 2 nails to each cleat.
For ribbed seam roofs use 10 cleats to each sheet with 2 nails to each cleat.
**16-oz. copper meets all ordinary conditions,* but in special cases heavier or lighter weights are sometimes used.

THE AMERICAN ROLLING MILL COMPANY

Makers of ARMCO Ingot Iron

EXECUTIVE OFFICES

MIDDLETOWN, OHIO

DISTRICT OFFICES

NEW YORK, N. Y., 50 Church Street

SAN FRANCISCO, CAL., Tenth and Bryant Streets
CLEVELAND, OHIO, B. F. Keith Building

Products

ARMCO INGOT IRON SHEETS: ARMCO Ingot Iron black sheets; ARMCO Ingot Iron blue annealed sheets; ARMCO Ingot Iron corrugated sheets; ARMCO Ingot Iron furniture sheets; ARMCO Ingot Iron galvanized sheets; ARMCO Ingot Iron plates; ARMCO Ingot Iron roofing sheets.

ARMCO Ingot Iron formed products, such as down-spouts, elbows, gutters, lath, metal shingles, pipe, are made and distributed by all leading sheet metal fabricators.

Rust Resistance

Among the five salient characteristics of ARMCO Ingot Iron is its pronounced resistance to rust and corrosion. This is the result of its freedom from the impurities that hasten rust. The total impurity content—consisting of carbon, manganese, phosphorus, sulphur, silicon and copper—never exceed *one-sixth of one per cent* in this purest of all irons. Galvanized sheets have a heavy, even coating of high grade zinc, thus assuring added protection.

Cost

Because of the additional refining processes involved in producing ARMCO Ingot Iron it costs slightly more than ordinary irons and steels. Still, when durability, ductility, and dependability are considered, ARMCO Ingot Iron more than compensates for the slight differential in first cost.

Numerous Installations—cornices, marquises, roofing, gutters, down-spouts—are giving anywhere from 50 to 100% longer service than less-pure irons and steels have given under identical conditions. Construction costs are lower, too; for ARMCO Ingot Iron, being pure and consequently soft and workable, forms easily and quickly to the most intricate architectural designs.

Many service records have demonstrated that ARMCO Ingot Iron, galvanized or painted, lasts the life of the building at less than one-quarter the material cost of copper or lead, and one-half the cost of zinc.

RECOMMENDED GAGES FOR DIFFERENT CLASSES OF WORK

Installation	Gage No. for residences	Gage No. for offices and public buildings	Gage No. for factories and warehouses
Roofing	26 to 28	26	18 to 24
Siding			20 to 26
Cornices	24 to 26	22 to 26	22 to 24
Skylights	24 to 26	20 to 26	20 to 26
Ventilators	24 to 26	18 to 24	16 to 24
Heating and ventilating ducts	22 to 26	16 to 26	16 to 26
Eaves troughs	24 to 26	24 to 26	22 to 24
Leaders	24 to 26	24 to 26	22 to 26
Flashing	26 to 28	26	may be lighter than roof
Valleys	24 to 26	24 to 26	same gage as roof
Ridge roll	26 to 28	26	may be lighter than roof
Window frames	22 to 24	22 to 24	22 to 24
Window sash	24	24	24

The heavy gages shown above should be used where unusually severe corrosive conditions are present.

How to Identify Armco Ingot Iron

The ARMCO triangle, stencilled in blue on every sheet, is definite protection against substitution of inferior grades or lighter gages. In each instance the gage is shown at the right of the triangle. All ARMCO Ingot Iron construction should reveal at least a portion of the blue triangle as shown at the left, for it is placed three times diagonally lengthwise on the sheet. If ARMCO Ingot Iron has been specified and the triangle is not in evidence, either inside or outside, it is certain that the specifications have not been followed.

Standard Gages and Sizes

ARMCO *Ingot Iron Galvanized Sheets* are carried in stock in the following sizes: Gages 16, 18, 20, 22, 24, 26 and 28. Widths, 24, 26, 28, 30 and 36 in. Lengths, 96 and 120 in.

ARMCO *Ingot Iron Black Sheets* are carried in stock in even gages from 14 to 26, inclusive, and in the same sizes as galvanized.

ARMCO *Ingot Iron Corrugated Sheets* for roofing and siding purposes are made with 5, 3, 2½, 1¼ and ⅜-in. corrugations. For general building purposes we recommend and carry in stock a 2½-in. corrugated sheet, 26 in. wide (after corrugating) for siding, and 27½ in. wide (after corrugating) for roofing. This size covers 24 in. in the width and allows for a one corrugation lap for siding and a one and one-half corrugation lap for roofing.

These sheets may be had from stock in the following sizes: Gages, 20, 22, 24, 26 and 28. Widths, 26 and 27½ in. Lengths, 60, 72, 84, 96, 108, 120 and 144 in.

All of the above sizes are termed standard sizes because they are carried in stock and used most frequently. All grades of sheets may be had in special sizes when an order is placed for 2000 lbs. or more of a size.

Where to Get Armco Ingot Iron

Distributors and "Ingot Iron Shops" in all parts of the United States and Canada supply galvanized sheets and sheet products, and in some instances, black and blue annealed sheets. Names and address of distributors and shops in any given territory supplied on request.

Two Useful Books Every Architect Should Have

"Galvanized Iron for Roofs and Roof Drainage" is a comprehensive work devoted to every-day problems in these important phases of building construction. It is replete with working data, reference data, detail drawings, tables, scales, nomenclature, and other valuable information for architects and engineers. (See specimen drawings on following page.)

"Galvanized Iron for Cornices, Marquises and Skylights" is a companion book to the first. It contains a wealth of detail drawings, suggestions and data pertaining to these types of sheet metal construction. (See specimen drawings on following page.)

Both books were prepared in collaboration with competent firms of architects and engineers and reviewed by The Producers Council.

Copies will be sent free of charge to any practicing architect or engineer on request.

APOLLOY METAL COPPER CONTENT

Apolloy Metal, Its Manufacture

The new materials entering into the various stages of fabrication are carefully analyzed in our own laboratory, assuring the use at all times of materials of the proper composition for the ultimate purpose intended.

The fundamental sheet mill operation—hot rolling—is done on the most approved rolling mill machinery under the direction of plant superintendents who give each order their careful and individual attention.

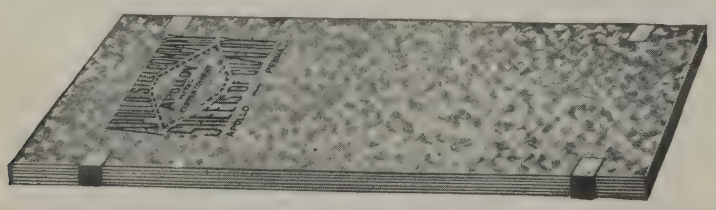
All sheets are rolled from soft ductile steel of special analysis to suit each individual requirement.

Apolloy Metal, Its Uses

Apolloy Copper Content Steel Sheets are manufactured in blue annealed, black and galvanized finishes. This brand has established for us an enviable reputation among our customers who have been using these sheets in the manufacture of their numerous products.

These sheets are especially recommended for exterior work such as roofing, siding, cornices, etc., for underground work such as vaults, culverts, tanks, etc., in fact, wherever the sheets will be exposed to the weather or other corroding agencies.

The extra cost of Apolloy Metal Copper Content Sheets is surprisingly low. Write to our nearest sales office for further particulars.

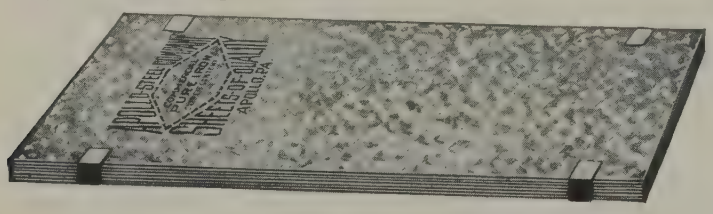


Apolloy Metal Copper Content Sheets

Commercial Pure Iron Copper Content Sheets

It is a known fact that the impurities in metal are the first to be attacked by corrosion. By eliminating impurities in-so-far as possible, it would follow that the resultant metal would have rust-resisting properties of the highest quality.

To supply the demand for this class of material we have specialized in commercial pure iron sheets. These sheets are especially suitable for use as corrugated metal culverts. Copper may be added in proper quantity and this imparts additional rust-resisting properties. The value of this material is attested by the fact that a number of state-highway departments specify iron sheets exclusively.

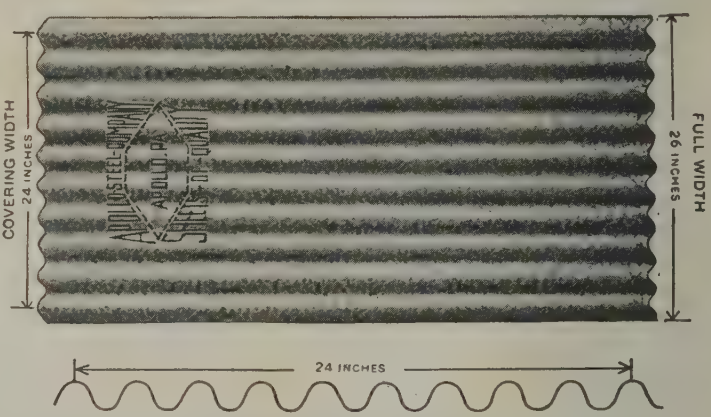


Commercial Pure Iron Copper Content Sheets

Corrugated Steel Sheets

Made of best quality regular and copper content black and galvanized sheets.

Corrugated sheets are the strongest form of sheet metal and are used for roofing and siding. The corrugations make the sheet more rigid and allow for expansion and contraction, adding strength to the structure to which applied. They are manufactured from flat sheets made in our own plant.



2½-in. Corrugated Steel Sheets

Plain Roll Roofing

Black and galvanized; 28 gauge and lighter. Put up in rolls, of five sheets, full 50 ft., 26½ in. wide; each roll has covering surface of 100 sq. ft.

CENTRAL ALLOY STEEL CORPORATION

Manufacturers of Toncan Copper Mo-lyb-den-um Iron Rust and Corrosion Resisting Sheets

MASSILLON, OHIO

REG. U.S. PAT. OFF.
TONCAN
COPPER
Mo-lyb-den-um
IRON
TRADE-MARK

Products

TONCAN IRON SHEETS: Black, Blue Annealed, and Galvanized.

TONCAN IRON ROOFING: Roll, V-Crimped, Pressed Standing Seam and Corrugated.

TONCAN IRON SIDING: Corrugated, and Reproductions of Rock Faced Stone, Rock Faced Brick and Lapped Weatherboard.

Also Toncan Iron Corrugated Sheets, straight and curved, for use with concrete work and other special purposes.

Description and Uses

Toncan is a carefully made commercially pure iron alloyed with copper and mo-lyb-den-um to obtain the greatest possible resistance to rust and corrosion. Its long life and easy working qualities are a matter of common experience.

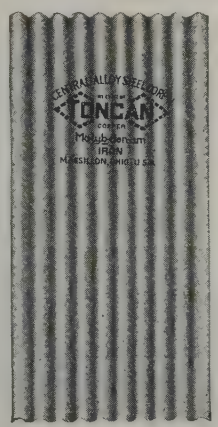
Toncan Iron is widely used for expanded metal lath, eaves trough, conductor pipe, ridge roll, valleys, flashing, cornice, balcony, marquise, window frames, skylights, tanks, ventilation, refrigeration—in fact, for every purpose which demands a durable sheet iron.

Roll Roofing
Painted or galvanized. Excellent for low pitched roofs. Covering width, 24 in. Each roll lays 100 sq. ft. on the building

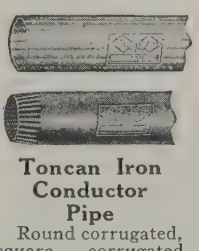
Three V-Crimp Roofing
An attractive form of Toncan roofing, covering width 24 in.; gauges, No. 20 and lighter; also made with 2 and 5 V-form

Expanded Metal Lath

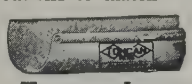
Many architects specify Toncan lath for all lath work as an extra assurance of lasting service. It should always be used for stucco and other exterior or exposed work.



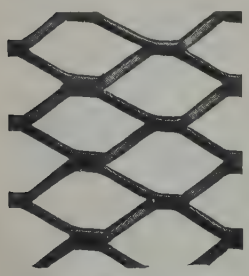
Corrugated Sheets for Roofing and Siding
Gauges No. 10 and lighter; 1¼ and 2½-in. corrugations are standard



Toncan Iron Conductor Pipe
Round corrugated, square corrugated and plain round conductor pipe. Lengths, 8 and 10 ft. All diameters. Elbows, miters and cut-offs to match



Toncan Iron Eaves Trough
Length, 10 ft. All widths; and gauges Nos. 28, 26 and 24



Toncan Expanded Metal Lath
Made in standard weights of 2.2, 2.5, 3.0 and 3.4 lb. per sq. yd. Sheets, 24x96 in., 9 sheets or 16 sq. yd. per bundle

Corrugated Ridge Roll
2½ or 1¼-in. corrugations. Lengths, 27 and 96 in.

Corrugated End Wall Flashing
Flat side on wall, 2 in. Corrugated apron, 4 in. Lengths, 27 and 96 in.

Advantages

In Toncan Iron lies the architect's most satisfactory solution for the sheet metal problem. It enables him to specify a moderate priced sheet metal of unquestionable durability—a durability proved by many years of use in thousands of structures and in every form of severe sheet metal service.

Identification

The trade-mark shown above is stamped in two or three places on every Toncan Iron sheet and die stamped on eaves trough, conductor pipe, elbows, etc.

Sources of Supply

Jobbers and tinners everywhere sell Toncan Iron sheets and products. On request, we will supply names of manufacturers or dealers who can furnish any special Toncan Iron product you may have in mind.

Specification Data

"All sheet metal work shall be of Toncan Copper Mo-lyb-den-um manufactured by the CENTRAL ALLOY STEEL CORPORATION, of Massillon, Ohio," is a safe specification; for Toncan meets all the requirements of modern sheet metal practice.

For trough and pipe, we recommend No. 26 gauge. For gutter, flashing, valleys, etc., No. 24 or, better still, No. 22 gauge. Roofing may be No. 26, 24 or 22 gauge. The heavier gauges should always be used where corrosive conditions are severe as along the sea coast or in a smoky atmosphere. Further information on Toncan Iron will be supplied promptly on request.

Masters in Roof Reproduction and Craftsmen in Metal

207-209 East 120th Street, NEW YORK, N. Y.

Products

"Antique Finish" Lead Coated Copper Leader Pipes, Heads, Gutters, Swan Necks, Ornamental Hand Wrought and Cast Lead Work, Antique Roof Reproductions of Slate Stones and Tiles.

Specialized Roofing Service

We design, fabricate, assemble and erect, upholding, with startling fidelity, the infinite standard of right maintained by the old masters.

Our service precludes the misunderstandings that frequently arise when quarry, foundry, mill, roofer and sheet metal contractor each expresses his individual interpretation of the architect's specifications. *For we handle the entire roofing and metal problem from its inception.*

The slates or tiles are quarried or manufactured under our supervision in accordance with a pre-determined scheme, and the colors, texture, sizes, etc. are assembled and checked by our inspectors at their point of origin before shipment is made.

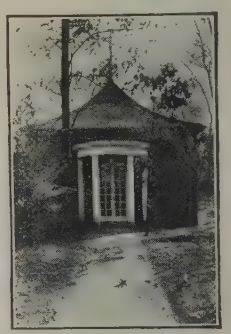
The success of the roof is predetermined by careful study of perspective from vantage points around the building. The color is distributed in accordance with accepted principles of color combination. Varying thicknesses are worked out to gradually decrease in weight from eave to ridge. Thus, the general ensemble has no suggestion of the "violence" which results when roofs are treated in a hit-or-miss, indifferent manner by allowing haphazard courses of color, thicknesses or sizes of slate or tile.

Exceptional Metal Work

Our "Antique Finish" lead-coated copper is made in *our own plant* under a patented process, and is a true reproduction of old cast lead. All of our metal work—lead coated copper, plain copper, lead or bronze—is fabricated, wrought or cast in our own plant to exacting requirements. Flashings and metal work generally are built-in at the building scientifically—with due allowance for contraction and expansion.

Chimneys are flashed through to the flue lining, all flashings built well into or through the walls and concealed from view, if desired, with absolute safety. Standing seam or batten roofs are installed in accordance with our special method (patent applied for) eliminating all soldering of joints, allowing full freedom for movement of the metal and insuring absolute weathertightness.

Roofing and Sheet Metal Specifications



The most comprehensive specification cannot express the interesting nuances, the effectively uneven character of the slates, the subtle refinement of detail that culminate in the truly correct roof on the French, English or Colonial residence.

We could suggest many paragraphs covering points of construction and description of results desired, but we have too often seen exquisite potentialities ruined by unfortunate interpretations of plans and specifications left to competitive bidders. Consequently, may we suggest your discussing and pre-determining in collaboration with our architectural consultants the treatment of your roofing and metal work and then incorporating in your specification the following clause under the heading of "Roofing and Sheet Metal Work":

The general contractor will allow the sum of $..... for all roofing and sheet metal work indicated on the plans and necessary, in the opinion of the architect, to insure the weathertightness of the building. All labor and material required for this work will be furnished by Klein & Kavanagh Inc., and upon completion, they will deliver to the owner their guarantee, bonded if necessary, to make good any of their work which may prove defective within the period of 10 years from the date of completion.

Studio Building, Riverdale, N. Y.
Dwight James Baum, Architect

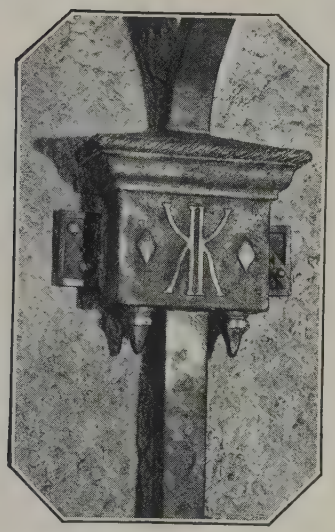
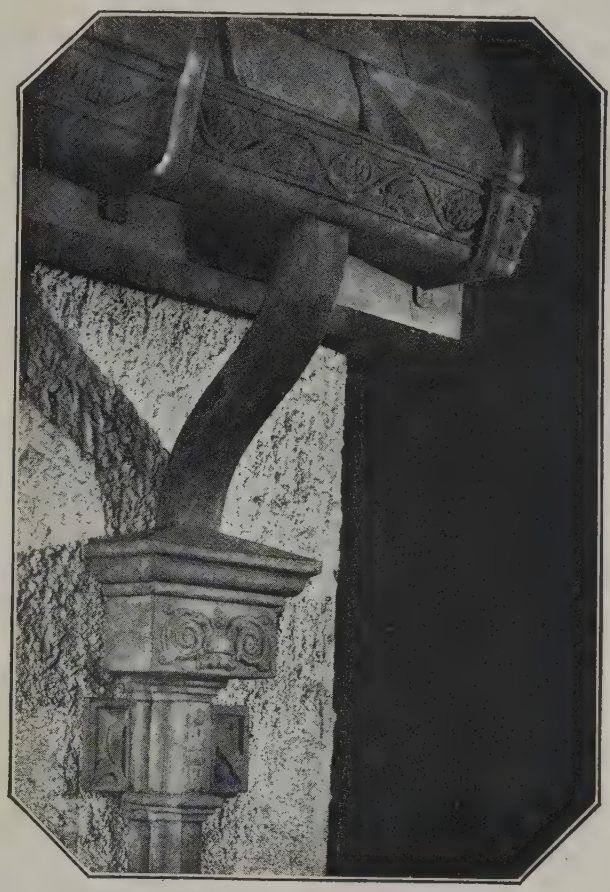
Ornamental Hand Wrought and Cast Lead Work

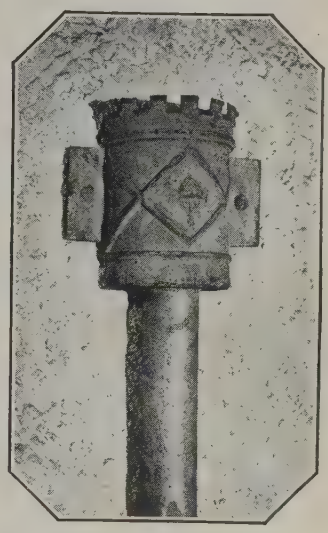
We are specialists in the art of hand wrought and cast lead work. We are not manufacturers but skilled workers in lead, producing not merely decorative objects of this metal but works of real art.

We have no catalogue or stock designs. Each work is original so that the finished product is exactly and artistically suited for the individual purpose required—and not a makeshift selected from some stock design.

Our works are executed from the designs of the architects or we will be glad to co-operate with the architect and produce designs for work that we are to be awarded.







The examples of leadwork shown on this page were executed by KLEIN & KAVANAGH

Manufacturers of Lyonore Metal Products

BALTIMORE, MD. WASHINGTON, D. C.

Products

"Lyonore Metal" Galvanized Sheets, Conductor Pipe, Eaves Trough, Roofing Terne Plate, etc.

Lyonore Metal an alloy
TRADE-MARK

Lyonore Metal—Corrosion Resistance

A knowledge of the resistance of the alloy Lyonore Metal to chemical influences is of practical importance.

Nearly all articles of metal are exposed to the action of gases contained in the atmosphere; besides nitrogen, there are oxygen, carbonic acid and aqueous vapors, such as steam and fog. In inhabited localities there is nearly always present sulphur, ammonia, etc. These gases together with moisture, rain or snow, readily create a condition that makes a metal exposed to them subject to the influence of electrolysis, the cause of rust, corrosion or disintegration.

Lyonore Metal is an alloy that is electrically balanced, the constituents being of such a nature and proportionately combined as not to be unduly influenced by electrolysis.

Its ability to resist the corrosive action generated by the gases mentioned above proves Lyonore Metal to be the most perfectly balanced alloy that science has been able to compose up to this period.

Several of the constituents used in the composition of Lyonore Metal are of the same substance as the metal that was used by the Egyptians in the joints of the stone work of the Pyramids in Egypt. This metal has resisted corrosion for more than five thousand years.

Other Features—Lyonore Metal is of a finer texture, and more homogeneous than steel or iron. It is pliable, yet tough. Can be worked with less labor and expense and, when formed, holds its shape. Has a tensile strength of 57,000 lb. per sq. in.

Its pliability and toughness make tighter seams possible and its finer texture holds galvanized coating better.

Lyonore Metal Terne Roofing Plates

Lyon Brand, made on Lyonore Metal Base of carefully selected, perfect sheets, carries 40-lb. coating. Coated by the genuine *pure palm oil process,* with pure new tin and new lead, in the proportions of 1 part tin and 2 parts lead, making this a *genuine* terne plate. 1C thickness is generally used for roofing. 1X thickness for valleys and secret gutters.

A Lyonore Metal Roof is lightning-proof when properly grounded.

Lyonore Metal Galvanized Sheets

Adapted for all forms of general sheet metal work.

Corrugated Sheets

Lyonore Metal is furnished in galvanized corrugated sheets in all standard gauges. Standard corrugations are 5/8, 1¼, 2, 2½, 3 and 5 in. Standard lengths are 5, 6, 7, 8, 9, 10 and 12 ft. Covering width is 24 in. Can also be furnished in pressed standing seam, V-crimped, weatherboard siding, beaded ceiling, brick and stone siding, etc.

Lyonore Metal Crimped Sheets for Cornice, Panels, etc.

Made in gauges Nos. 27, 26, 24 and 22. These sheets, crimped $\frac{3}{16}$ in., are especially suitable for cornice. They are stronger, not easily dented, and, when painted, give the appearance of stone.

Standard Specifications for Tin Roofing

For Lyonore Metal Tin Roofing in standing seam, flat seam or ribbed.

All tin roofing on this building shall be Lyonore Metal Base, Lyon Brand 40-lb. coated, 1C thickness for all roofing, and 1X thickness for valleys and gutters, to be done in accordance with the Standard Specifications of National Association Sheet Metal Contractors.

Standard Specifications for Sheet Metal Work

All galvanized sheet metal on this building shall be Lyonore Metal of gauges specified for each class of work.

Note: For best results, we recommend that the following gauges be specified for various classes of sheet metal work.

For conductor pipes, hanging gutters and eaves trough	No. 26 gauge
For cornices	No. 24 gauge
For skylights	No. 24 gauge
For gravel strips and flashings	No. 26 gauge
For ventilating ducts and dust conveyors (inside work), specify gauge number according to size of duct as follows:	
16-in. diameter and smaller	No. 26 gauge
18-in. diameter	No. 24 gauge
Larger than 18-in. diameter	No. 22 gauge
For paneling and moulding	No. 24 gauge
For special work	No. 24 gauge

Literature and Samples

We will submit samples of various forms of Lyonore Metal and literature bearing on its use.

Write for File 12c7 containing valuable information for architects and engineers.

THE NEWPORT ROLLING MILL CO., INC.

Sole Manufacturers of Gohi (Genuine Open Hearth Iron) Rust-resisting Sheets, Roofing, Siding and Accessories

NEWPORT, KY.

Products

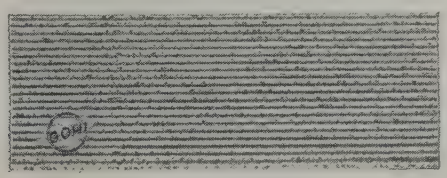
GOHI (GENUINE OPEN HEARTH IRON) includes Black and Galvanized Sheets, Plain or Corrugated; Corrugated Arches; Corrugated Awnings; Corrugated Ridge Rolls; Pressed Standing Seam Roofing; Plain Roll Roofing; Roll and Cap Roofing; Weatherboard Siding; Beaded Ceiling; Beaded Siding; Brick Siding; Rock Face Brick Siding; Rock Face Stone Siding; Metal Shingles; Plain Ridge Roll; Cornices; Louvers; Eaves Trough; Conductor Pipe; Elbows and Shoes; Mitres; Cut-offs; Skylights and Metal Ceilings.

TRADE-MARK

Description

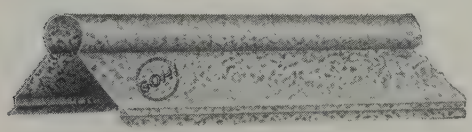
GOHI (Genuine Open Hearth Iron) pure iron copper alloy rust-resisting sheets and formed products will analyze approximately 99.875% pure—considering as impurities the dangerous rust and corrosion agents, namely: carbon, manganese, phosphorus, sulphur, silicon, nitrogen, hydrogen and oxygen.

In addition, GOHI (Genuine Open Hearth Iron) has a copper content of not less than two-tenths (.2) of one per cent (1%) or over three-tenths (.3) of one per cent (1%). This addition of copper to the pure base metal produces a superior lasting and rust-resisting quality product.

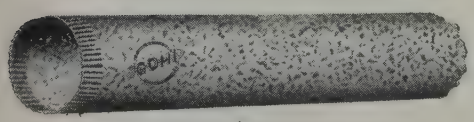


Corrugated Sheet

Roll and Cap Roofing



Ridge Finish



Conductor Pipe

Roof Gutter

Advantages

GOHI (Genuine Open Hearth Iron) is absolutely uniform in quality, being manufactured from the highest grade of selected materials, thus assuring one of the best rust-resisting metals for any and all conditions. GOHI will give longer life and is more durable than re-worked muck bar, charcoal iron, steel, or other iron sheet metal. On account of its superior working qualities, labor costs are reduced and are actually less than in working up steel or other iron sheets. Lasting qualities considered, GOHI is more economical than other sheet metal building materials you can specify.

Sources of Supply

Jobbers, dealers, hardware concerns, etc., everywhere sell GOHI (Genuine Open Hearth Iron) sheets and formed products. On request, we will supply names of distributers who can furnish GOHI in sheets or in the formed products specified above.

Service

GOHI has been produced on a foundation of quality, and knowing it to be as good as human ingenuity can make it, THE NEWPORT ROLLING MILL CO., INC., has directed all efforts to improved service.

We recently had prepared by a firm of architects, a file folder containing a complete analysis and specifications of GOHI (Genuine Open Hearth Iron). This valuable information should be in the hands of every architect specifying quality sheet metal work. It also shows ways and means in which GOHI (Genuine Open Hearth Iron) may be used to advantage in building construction. If you do not have a copy of this folder we will be very glad to forward it to you upon request.

We have also available for your reference, leatherette folders containing sample gauges of GOHI which are mailed free upon request.

THE NEW JERSEY ZINC COMPANY

ESTABLISHED 1848

Makers of Rolled Zinc for Roofing and Roofing Accessories

PRODUCTS DISTRIBUTED BY

THE NEW JERSEY ZINC SALES COMPANY

160 Front Street	Marquette Building	Oliver Building	Guardian Building	Merchants Exchange Building
NEW YORK, N. Y.	CHICAGO, ILL.	PITTSBURGH, PA.	CLEVELAND, OHIO	SAN FRANCISCO, CAL.

Products

HORSE HEAD ROLLED ZINC.
FLAT SHEET ZINC.
STANDING SEAM HORSE HEAD ZINC ROOFING.
CORRUGATED SHEET ZINC ROOFING and SIDING.
For Paint Pigments, see page B2068.

Uses

For roofing (standing seam, batten or ribbed seam, shingles and corrugated), siding, conductor pipes, eaves troughs, valleys, flashings, and all exposed sheet metal work.

Advantages of Zinc

Durability—Zinc is a metal (not an alloy of other metals) which is extremely resistant to the corrosive action of the elements. It rapidly acquires a very adherent protective coating which will always form whenever any raw zinc is exposed.

Color—This protective coating has a light battleship gray color which will darken with age and approach the color of slate.

No Stain—Zinc sheet metal work can not stain marble, stucco or light colored surfaces.

Cost—The cost of zinc is approximately halfway between that of copper and galvanized steel of equal thickness.

Weight—The weight of zinc per square foot is less than that of copper, lead, galvanized iron, or steel, of an equal thickness.

Painting—Zinc does not require paint as a protection against the elements, but paint can readily be used if other than the natural color of zinc is desired.

Wood Shingles—Since most wood shingles, notably redwood and red cedar, exude acids which are harmful, the use of zinc for sheet metal work is not recommended on buildings covered with this material.

Roofing—Specifications (Condensed)

(1) Shingles—Shall be made from Horse Head Rolled Zinc not less than 0.018 inches thick and laid in accordance with the manufacturer's specifications. Minimum slope 4 inches per foot.

(2) Standing Seam—Use the standard Standing Seam Horse Head Zinc Roofing installed in accordance with the specifications sent with each square of roofing. Minimum slope 2 inches per foot.

(3) Batten or Ribbed Seam—Roofs of this type shall be made from either Horse Head Rolled Zinc (2) or New Jersey Sheet Zinc. The metal used shall be not less than 0.024 inches thick for battens spaced not more than 18 inches on centers. For wider batten spacings, heavier metal shall be used. Minimum slope 3 inches per foot.

Valleys—All valleys shall be made from Horse Head Rolled Zinc not less than 0.024 inches thick and shall be attached to the roof by zinc clips. The nails holding the roofing material must not pass through the valleys.

Note: Horse Head Rolled Zinc is not manufactured wider than 20 inches.

Flashings—All flashings shall be made from Horse Head Rolled Zinc not less than 0.024 inches thick. When used on masonry, concrete, or stucco, they shall be laid on a good grade of waterproof sheathing paper. The reglet for the cap flashing shall be pointed up with elastic roofing cement.

Conductor Pipes and Eaves Troughs—These shall be made from Horse Head Rolled Zinc not less than 0.024 inches thick. The eaves troughs shall be hung on galvanized shank and circle hangers spaced not over 2 feet on centers. Conductor pipes shall be supported by galvanized rack and pin pipe fasteners securely soldered to the pipe.

Corrugated Sheet Zinc Specifications (Condensed)

The New Jersey Corrugated Zinc Sheets have corrugations 2½x⅞ inches deep. These are furnished both for roofing and siding in standard widths and specified lengths.

(1) Roofing Sheets—Corrugated Zinc Roofing Sheets shall be not less than 0.024 inches thick when used over a fully sheathed surface and not less than 0.032 inches thick when used over open purlins not over 48 inches on centers. For wider purlin spacings, heavier gauge sheets shall be used.

(2) Siding Sheets—Corrugated Zinc Siding Sheets shall be not less than 0.024 inches thick.

Write for Detailed Specifications

Further and more detailed specifications on any zinc work will gladly be furnished on request. Our engineering services are always available in connection with the uses of our materials. Please do not hesitate to consult us.

Also Lead-sealed Flat Sheets, Eaves Trough, Conductor Pipe and other Formed Products.

Description

Lead-sealed consists of two surfaces of pure lead sealing a core of special analysis, copper content steel. It is manufactured by an exclusive process, which insures against peeling or flaking of the lead surfaces and provides pure lead protection with the light weight and strength of steel.

Both sides of a sheet of Lead-sealed present a smooth, uniform, impermeable surface of pure lead, without break or flaw

The two surfaces of imperishable lead seal a core of special analysis, copper content steel. The lead surfaces are unusually heavy; the base metal *is* sealed

Uses

For industrial structures, sheet metal roofs and siding have many advantages—low material and labor cost, light weight, flexible strength and protection from fire and lightning. It is the special quality of Lead-sealed

that it combines these advantages with the superior resisting qualities of pure lead, which opposes deterioration in all forms.

While many times more rust resisting under like conditions than any coated sheet, the resistance of Lead-sealed to smoke, acid, salt air and gas fumes is incomparably greater. For these reasons, it is most emphatically recommended for chemical plants, gas plants, mills, foundries, seacoast warehouses and dock buildings, railroad shops and depots, and all other industrial structures where conditions such as are here illustrated prevail.

For such applications, Lead-sealed roofing and siding offers the most desirable combination of moderate first cost with extremely long and dependable service.

Characteristics

The manufacturers of Lead-sealed have long been recognized as authorities on high grade coated sheets.

The process by which it is made is exclusive and may be identified, not only by the trade-mark, but by the heavy weight of the lead surfaces and the perfect sealing of the base metal. The sheets are uniformly soft and level and easy to work.

Specification Data

Lead-sealed is made in standard sizes of corrugated roofing and siding, roll and V-crimp roofing, etc., and flat sheets, Nos. 12 to 28 gauge. Methods of application are those of standard sheet metal practice. Lead headed nails are recommended and can be supplied by this company. Any special information will gladly be given on request.

Supply

Lead-sealed may be specified through leading distributors of sheet metal products, or by writing direct to this company or its representatives.

HOYT HARDLEAD PRODUCTS

UNITED LEAD CO.
SUBSIDIARY OF NATIONAL LEAD CO.
111 Broadway
NEW YORK, N. Y.

Products

Hoyt Hardlead Roofing Sheets; Rain Water Pipes; Rain Water Pipe Heads; Pipe Bands; Gutters; Spandrels; Finials; Statuary Garden Ornaments; Ornamental Hoyt Hardlead Work of every description.

For Lead Cames, see page B2183.

Hoyt Hardlead

Hoyt Hardlead has a much greater tensile strength than soft lead, which permits its use in comparatively thin sheets, making it thoroughly practical and adaptable to modern building construction. It can be stamped, formed or cast in any shape desired. When exposed to the atmosphere it takes on a soft gray, non-staining patina that brings out the true value of adjacent materials and gives a balance to these materials that cannot be obtained with other metals. It will lend dignity and character to any structure where permanence and beauty is desired.

It is used for roofing, flashings, cornice coverings and other building purposes where it is practical to use sheet metal.

It is rolled in sheets 24, 30 and 36 in. wide and 96 in. long, weighing 2½, 3, 4, 6 and 8 lb. to the sq. ft.

The proper weight of Hoyt Hardlead Sheets depends upon the purpose for which they are to be used. For roofing, cornice coverings and base flashings generally the 3-lb. sheet is recommended, and for cap flashings and batten roofs where the battens are spaced 24 in. or less on centers the 2½-lb. sheet may be used.

Spandrels

Architecturally and economically there are many advantages in the use of Hoyt Hardlead Spandrels.

It is possible to obtain in Hoyt Hardlead effects that cannot be duplicated in other materals which in contrast present an extreme severity of line. Softness of line and low relief are characteristics of stamped Hoyt Hardlead.

The soft gray color of Hoyt Hardlead is uniform and permanent. Unlike other metals, Hoyt Hardlead Spandrels require no painting nor other maintenance, and do not stain adjacent masonry.

Catalogue

Our catalogue illustrates a complete line of architectural and ornamental lead work. This catalogue will be sent to architects on request.

Product

ROLLS of ROOFING ZINC MATERIAL to be used as a Cap Sheet over asphalt, felt built-up roofs.

Also Zinc-Felt Flashing Material.

Description

This zinc sheet is an inexpensive sheet of metal thick enough to stand walking on, even with hobnails. The zinc is embossed to allow for expansion and contraction and this also makes a rough surface to which asphalt will adhere. The zinc-felt flashing strip is a heavier grade of zinc mounted on 15-lb. roofing felt—weight approximately 38 lb. per 100 sq. ft.

Advantages of the Zinc Protected or Zinc-Felt Built-up Roofs

To make a long story short, our zinc-felt built-up roof is a common asphalt, felt built-up roof covered with a sheet of zinc rolled into the top asphalt as a cap sheet. This, by reflecting the sun's rays, prevents the evaporation of the oils in the asphalts beneath it. With these asphalts thus protected, it is possible to reduce the number of layers of asphalt and felt usually applied and at the same time secure a cheap and everlasting roof. Both zinc and asphalt felts are known roofing materials.

The zinc in itself is waterproof and will not rust. The zinc cap sheet holds the oils in the asphalt and asphalt saturated felts and so increases their waterproofing value indefinitely.

The zinc adds fire protection.

It also adds durability at the flashing where durability is needed.

Sizes

The zinc is shipped in rolls 20½ in. wide and 200 ft. long. One roll will cover 300 sq. ft. of roof surface including 2-in. horizontal laps and 6-in. vertical laps. The zinc-felt flashing material comes in rolls 10 in. wide and 105 ft. long.

Architect's Condensed Specifications

To be included in carpenter's or mason's specifications.

The wood sheathing should be dry, smooth, and free from projections of any kind. All roofs should be graded to drain to gutters and gutters to down-spouts.

Concrete or gypsum decks should be firm, smooth, dry, and free from loose material. The roof deck shall be properly graded to outlets.

Materials—*Felts* to be standard grade asphalt felt weighing 15 lb. to the 100 sq. ft., approved by architect.

Zinc to be REYNOLDS METALS COMPANY rolled and embossed roofing zinc.

Asphalt Cement to be standard grade roofing asphalt as approved by architect.

Counterflashing to be REYNOLDS METALS COMPANY zinc-felt.

Method of Application—(1a) Cover the entire roof with 2 or 3-ply asphalt felt as specified by the architect. Over a wood deck, the first ply of felt should be nailed to the wood deck with 1¼-in. roofing nails over large tin washers. Nails to be staggered not more than 1 ft. apart. If two-ply of felt is used 32 in. wide, same should be lapped 17 in. on the preceding one. If three-ply of felt is used same should be lapped 22 in. on the preceding roll. Mop between all layers of felt with approved asphalt cement approximately 30 lb. to the 100 sq. ft. so that in no case does felt touch felt.

(1b) Over a cement or gypsum deck, the deck should first receive a mopping of approved asphalt primer and the felt be mopped to the deck with hot asphalt instead of being nailed as required in (1a), then proceed as described in (1a).

(2) Begin at the outer and lower edge of the roof, mopping the felt with asphalt cement 30 lb. to the 100 sq. ft. Immediately behind the asphalt mopping roll in the sheets of zinc lapping each sheet 2 in. on the preceding zinc sheet and mopping with asphalt between each lap. At vertical joints, lap zinc on zinc 6 in. Roll the entire roof with a heavy roller behind the laying of the zinc. The zinc shall be applied in lengths not exceeding 22 ft.

(3) All felts and the zinc should be extended up all vertical walls or other vertical surfaces at least 6 in. as a flashing. In addition to this flashing, all vertical walls should be counterflashed as follows:

Lay a strip of REYNOLDS METALS COMPANY zinc-felt 10 in. wide, up the vertical walls 6 in. and lapping down on the roof 4 in. Turn the metal covered side back into the vertical wall 1 in. and wedge and cement into wall. Mop under same with hot asphalt.

Note: Write for complete specifications.

WHEELING METAL & MFG. CO.

Manufacturers of Roofing Material and Accessories

OFFICE AND PLANT

WHEELING, W. VA.

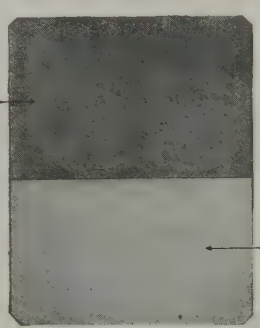
Products

LEADCLAD SHEETS (flat, corrugated and V-crimp), LEADCLAD ROLL ROOFING and STANDING SEAM, LEADCLAD SHINGLES, LEADCLAD SPANISH TILE, LEADCLAD SIDING, METAL CEILINGS, LEADCLAD RIDGE ROLL (plain and corrugated), LEADCLAD CONDUCTOR PIPE and FITTINGS, LEADCLAD EAVES TROUGH and GUTTER, complete line of LEADCLAD ROOFING ACCESSORIES.

Also Apex Heavy Galvanized Roofing Materials.

Leadclad Rust Resistance

Leadclad products are made from copper bearing steel, coated, as the name indicates, with a heavy, tough jacket of everlasting lead. Architects know the lasting properties of lead—its resistance to rust, as shown in famous buildings the world over, such as the Pantheon and St. Peter's at Rome, Windsor Castle and St. Paul's in London, the Paris Opera and many others. The coating of Leadclad is several times heavier than ordinary galvanized. Its great resistance to rust is due to this extra heavy coating of lead.



Leadclad Shingles

Leadclad decorative shingles make a lasting roof for smaller commercial buildings, store fronts or residences. A number of pleasing designs are available—three of these are shown on the opposite page.

Leadclad Spanish Tile

The charm and color of old Spanish Tile is retained in Leadclad Tile with the additional advantages of light weight, economy and permanence. Leadclad Spanish Tile is finding a wide use for the roofs of gasoline stations, store fronts, smaller commercial buildings and any Spanish type of small home construction. Complete accessories make the erection of a Leadclad Spanish Tile roof easy and economical.

Leadclad Cornices and Skylights

Leadclad Sheets are made in convenient sizes for all types of standard skylights, ventilators and cornices. Sizes available on request. The ductility and easy working qualities as well as its permanence make Leadclad desirable for these important uses.

Leadclad Sheets

Leadclad Sheets are made in flat corrugated and crimp styles. Flat sheets are made in standard sizes up to 36 in. wide and 144 in. long in all gauges 18 to 30, inclusive. Corrugated sheets (made with 1¼, 2½ or 3 in. corrugations) are made in gauges 18 to 29, inclusive. Leadclad 2, 3 and 5 V-crimp roofing comes in gauges 24 to 29, inclusive.

Leadclad Roll Roofing and Standing Seam

Leadclad Standing Seam is made 26, 28 and 29 gauges, in 122x26½-in. sheets—5 sheets to a roll (50 lin. ft. The standing seam provides for necessary expansion and contraction making the use of long sheets practical. Roll roofing is made from 14x20-in. or 20x28-in. plates, and cross seams are single locked unless double locked is specified. Particularly recommended for flat seam work.

Leadclad Gutters, Valleys and Conductor Pipe

The Leadclad line of roofing materials is complete in every respect. Conductor pipe is made in plain round, round corrugated and square corrugated styles together with all standard types of fitting. Leadclad gutters, valleys and eaves trough are furnished in all popular styles and standard sizes. On all Leadclad roofs it is recommended that Leadclad nails and washers be used to insure a permanent job.

Standard Specification for Sheet Metal Work

Labor and material for all sheet metal work shall be furnished in accordance with drawings and specifications. All sheets and roofing accessories, including conductor pipe, elbows, gutters, nails and washers, shall be Leadclad as manufactured by the WHEELING METAL & MFG. Co., Wheeling, W. Va., of.....gauge. (See chart below.)

RECOMMENDED GAUGES FOR DIFFERENT CLASSES OF WORK

Use	Recommend Gauge Leadclad			
	For offices, apartments, large commercial buildings	Industrial plants	Residences	
Roofing	24 to 26	18 to 24	26 to 29	Or Leadclad shingles or Leadclad Spanish tile
Skylights	20 to 26		24 to 30	
Flashing	20 to 26	Same or lighter than roof	26 to 29	
Valleys	24 to 26	Same as roof	24 to 28	
Ridge roll	24 to 26	May be same or lighter than roofing	24 to 29	
Cornices	22 to 28		24 to 30	
Siding		18 to 29		
Ventilators	18 to 24	18 to 24	24 to 26

Architects Specifications for Spanish Tile

All pitched roof surfaces shall be covered with Edwards Metal Spanish Tile, manufactured by THE EDWARDS MANUFACTURING CO., Cincinnati, Ohio, to be made from .....

[Insert here, Tin Painted, Tight-cote Galvanized, No. 9 or No. 11 gauge Zinc, 9-oz., 12-oz. or 14-oz. Copper. If painted, specify whether red or green.]

Roof surfaces to be covered with felt or building paper. Tile to be applied straight and true, so all horizontal lines are parallel with the eaves and all vertical lines are at right angles to the eaves. Fixtures shall be .....

[Insert here Regular, Bungalow or Chinese.]

Directions for Applying Edwards Metal Spanish Tile Roofing

Felt—

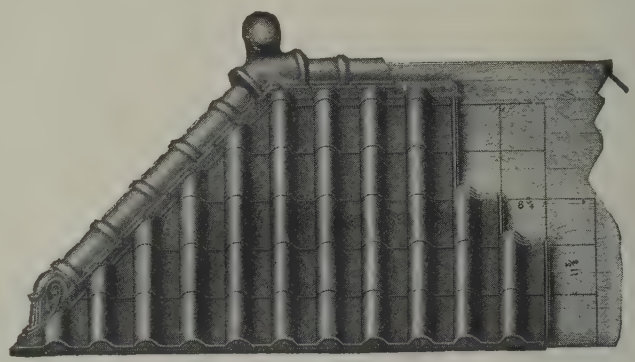
Put on a felt or paper covering on the solid board sheathing. This need not be expensive felt. Ordinary building paper answers the purpose very well. This is done in order to keep out drafts which might draw moisture through, and also to act as a deadening agent.

Line Roof—

Take a chalk line and line roof horizontally, parallel with the eaves at 11⅝-in. distances, with the exception of the first row for eave tile where the distance depends on the pitch of the roof. To determine this, lay an eave tile No. 369 on the roof with the closed end pushed up against the eave, and measure the actual distance. Then line roof vertically, at right angles with the eaves, distances of 8¾ in.

Eave and Field Tile—

Lay the eave tile course first. Commence at the left. The nailing flange is covered up by locking the next tile in place. See that the chalk lines are followed.



Method of Applying Tile and Fixtures

Then lay the field tile in the same manner, working from left to right, following the chalk lines. In lapping the course below, see that the bottom of the upper course is up against the lower storm ribs of the lower course.

Hip and Ridge—

Put 2x4-in. or 2x6-in. strips on edge on all hips and ridges. When working against a hip or ridge, cut the tile to butt against the strips. When tile is applied, nail hip and ridge flashings against the side of strips, keeping them straight and at the same height. Then place the hip and ridge finish by resting it on the outer edges of hip and ridge flashings, and fasten by turning the cleats over the lower flange of the finish.

Finials and Hip Starters—

These are put on in the same manner as the hip and ridge finish and held in place by cleats.

Valley—

The long valley sheets, No. 381, are nailed down before applying tile. In finishing a course at a valley, use a left valley tile and in starting a course at a valley, use a right valley tile. Cut the flat surface of the valley tile, so that the edge will run parallel with the lock or fold in the valley, and will overlap it about ½ in.; then bend, or fold the valley tile into the lock in the valley. Be careful that the closed ends are kept in a straight line. Note different lengths of valley tile. This is to avoid waste. Use long or short tile as distance varies going up the valley.

Various Flashings and Fixtures

We manufacture many fixtures to take care of different and special conditions. They are easy to apply and blend perfectly into the balance of the roof, so that the complete roof is a compact unit.

GLASIRON ROOFING TILE

MANUFACTURED BY

GLASIRON PRODUCTS COMPANY

DETROIT TELEPHONE
LAFAYETTE 6278

Scotten Avenue at Michigan
DETROIT, MICH.

Glasiron Roofing Tile

Three nationally known trademarks represent the materials composing Glasiron Roofing Tile. The base, armco ingot iron, and the two coats of pemco glass fused together at 1600° F., produce a roofing tile extremely durable and of *permanent beauty*. Its exceptional merits are readily recognized. You may rightly consider Glasiron as a gold bond investment which will not depreciate in value. During the entire life of a building it will remain in perfect condition without one cent of maintenance and its color and beauty are permanent.

Each tile has a slightly rounded crown 1⅝ in. high in the center, covering space 10.4 in. wide and 9.8 in. high—the main ridge covering 8 in. of roof surface. The roof completed shows heavy shadow lines giving it striking individuality and distinctiveness which can be accentuated by blending the endless number of single colors which are available. Unlimited color choice of single colors or blends of two colors in each tile may be secured in three different surface textures, Glazed, Dull and Sand.

Glasiron ROOFING TILE

ARMCO Ingot Iron

PEMCO

Advantages of Glasiron Tile

(1) Unusual durability.
(2) No yearly maintenance.
(3) Non-fading colors.
(4) Unlimited color choice.
(5) Easy and quick application.
(6) Adaptable any construction.
(7) One-sixth weight of clay tile.
(8) Low understructure cost.
(9) Cool summer—warm winter.
(10) Waterproof and noiseless.
(11) Architectural beauty.
(12) Adaptable over old roofing.
(13) Fireproof—lower insurance.

Notice to Architects

When Glasiron Roofing Tile is specified, actual roof dimensions of all roof surfaces to be covered with tile, should be shown on blue prints as fully as possible. After receipt of architect's blue prints, manufacturer will draw up a roof sketch showing all cuts and roof dimensions. Upon receipt of this sketch, architect is to make any necessary corrections, O.K. the sketch in space provided for same, and return to manufacturer. Four copies will then be forwarded to architect, one copy to be given to general contractor, carpenter contractor and roofing contractor. Manufacturer will then make all cuts according to dimensions shown on roof sketch. Cuts made by manufacturer in this manner before coating is applied, preclude any possibility of yearly roof maintenance.

Sun Oil Service Station, Philadelphia

Architects' Specifications

Roofing and Sheet Metal Work—*Instructions*—Manufacturer will make all cuts for valleys, hips and flashings, dormers and all other irregular sections of roof according to manufacturer's "Roof Sketch." All major cutting shall be done by manufacturer on the raw tile before coating is applied.

All roof surfaces must be constructed strictly according to the dimensions shown on "Roof Sketch" and roofing contractor shall report to general contractor any variation in roof surfaces from these dimensions. Roof corrections must then be made before tile is applied.

Application—All roofing is to be laid strictly in accordance with the GLASIRON PRODUCTS COMPANY'S latest Method of Laying Instructions. Architects' instructions herein contained, supersede those of manufacturer.

Roofing—The main, porch, dormer and all other roof surfaces so indicated on the drawings shall be covered with Glasiron Roofing Tile of ..... color ..... finish as manufactured by the GLASIRON PRODUCTS COMPANY, Scotten Avenue, at Michigan, Detroit.

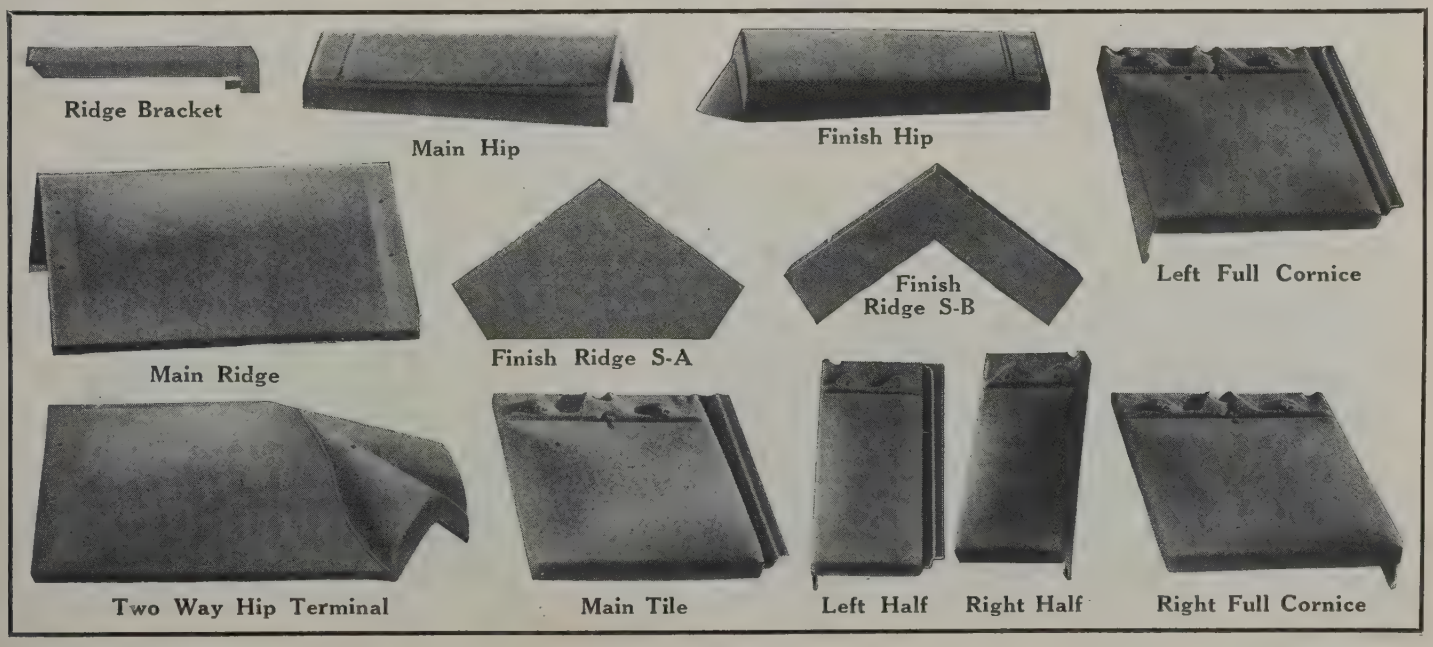
Roofing Felt—All roof surfaces shall be covered with 30-lb. asphalt felt (one thickness, each horizontal layer to be lapped toward the eaves) or in accordance with manufacturers' method of laying specifications (double thickness).

Nails—Deniston "led-hed" copper nails 1¾ in. or longer, two nails to each tile are to be used in fastening. 3-in. or longer copper nails with lead washers are to be used in fastening each ridge bracket and hip according to manufacturer's instructions.

Flashings—(Galvanized armco ingot iron, 24 gauge) or (.. oz. Copper) is to be used for making a 5-in. drip at eaves in accordange with manufacturer's specifications. Same material is to be used for making a base and cap flashing course against all parapet and party walls, roof posts, porch roofs where they connect with the walls, chimneys, saddles, etc. Roofing felt shall be laid 5 in. or more up the side underneath flashing.

Roof Boarding—(Or sheathing) shall be ⅞ in. thick and not more than 8 in. wide, tongued and grooved, surfaced one side and free from waves, shakes, loose or large knots.

Cutting—If it is necessary for roofer to cut any tiles to secure proper fitting, all cut edges or openings shall be thoroughly filled and covered with a high grade roofing cement and painted to conform closely with the color of tile used.



ESTABLISHED 1856

JACOB RINGLE & SON, INC.

Contractors for General Roofing and Sheet Metal Work
Manufacturers and Installers of Our Special Jumbo Copper Tile Roofing

466-472 Grand Street, JERSEY CITY, N. J.

JUMBO COPPER SPANISH TILE

In quick changing temperatures nothing stands, as a permanent roof covering, quite so well as copper—especially copper tile—where they are securely fastened to the decking, and ample provisions made for expansion and contraction.

Jumbo Copper Tile are made of special annealed soft copper, equal in weight to 16-oz. copper.

They are classified as Standard Copper Tile, Lead Coated Copper Tile, and Dwarf and Oversize Copper Tile.

Standard Copper Tile

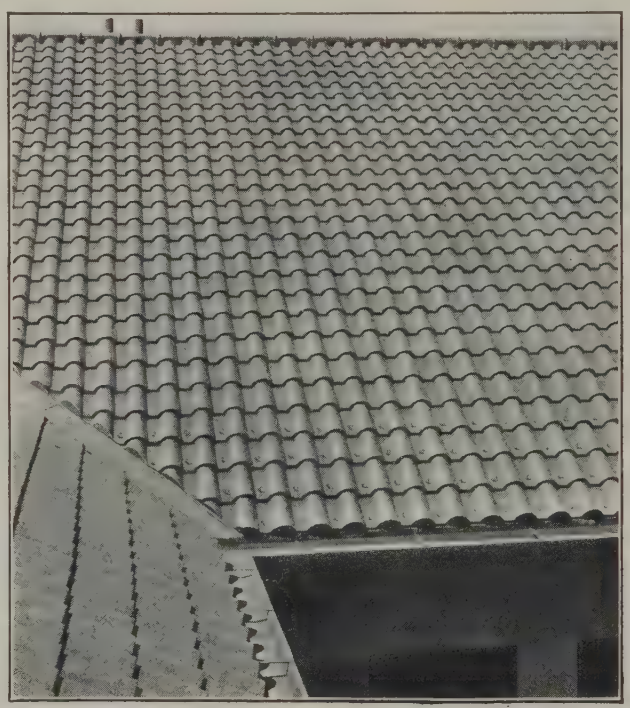
Standard Copper Tile are plain, 16x12 in. with heavy butts, interlocking at sides, top and bottom. Formed with rolled tapered section. Each tile is independent of the other with ample provision for expansion and contraction.

Lead Coated Copper Tile

Lead Coated Copper Tile are made exactly the same as the Standard Tile in form and size but in addition are treated with a heavy rough coating of lead on exposed side only.

With the use of Lead Coated Copper Tile the massive, heavy lead effect is secured without the necessity of providing additional framing which would be required to support a genuine lead tile roof.

The lead coating has no detriment effect on the copper nor does it add to its life.



Standard Jumbo Copper Spanish Tile Roof, Municipal Building, Brooklyn, N. Y.
McKenzie, Voorhees & Walker, Architects
45,000 sq. ft.—installed in 1926

Dwarf and Oversize Copper Tile

Dwarf and Oversize Copper Tile are used to create our "Anteekcraft Tile" roof.

A complete roof is laid of our Standard Copper Tile after which Dwarf and Oversize tiles of various shapes and sizes are applied at random over the Standard Tile and soldered securely in place. There is no limit to the artistic effects that may be obtained.

Comparative Weight, Cost and Maintenance

Jumbo Copper Tile weighs 200 lb. per square and standard clay tile approximately 1500 lb. per square.

Jumbo Copper Tile is no more expensive than standard clay tile in that it does not require extra heavy or special framing to support its weight.

Jumbo Copper Tile does not break, loosen and fall, and its maintenance cost is small.

Coloring of Copper Tile—Not Coated with Lead

(1) Nature is the best artist in the coloring of copper where the permanent Verde Antique finish is desired.

After the copper has been installed the entire surface should be cleaned and given a coating of pure linseed oil, weather and time will accomplish the rest.

Locations usually determine the length of time needed by nature to produce the desired effect.

After cleaning and coating the tile with linseed oil,

Mayfair Apartments, Park Avenue and 57th Street, New York, N. Y.
Charles A. Rich, Architect
15,000 sq. ft.—installed in 1905

Continued on next page.

a dull bronze effect is obtained for a short period of time, they then gradually darken and begin to take on the finish that will eventually be the pleasing light green or Verde Antique. This finish is permanent when created by nature and does not have to be renewed. Neither does it craze nor crack, affecting the body of the tile underneath.

(2) Artificial finishes are not permanent, and usually wash off during the first heavy rain, or a quick change in temperature.

Construction of the Various Jumbo Copper Tile Units

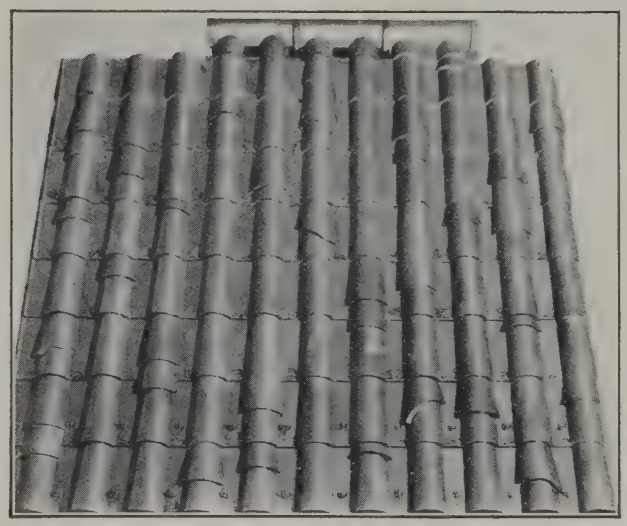
Ridge Units—Are made in split sections consisting of two pieces with rolled sides, extension apron for covering the top field tiles, round side laps, and an excess allowance at the top for standing seam or lock joint.

Standard size of the completed ridge unit in place—20½ in. long, 6 in. high and an average width over all of approximately 20 in.

Hip Units—Are made complete and ready to apply, formed with tapered roll, lap at bottom with 1 in. butt, shoulder at top and flanged at sides for soldering to the field tile. They are large and give a heavy massive effect.

Standard sizes of the completed hip unit in place—17 in. long, 9¼ in. wide, with a center height at butt of 7½ in.

Field Units—Are made complete and ready to apply, formed with a combination of flat valley surface and tapered roll, lap at bottom with 1 in. butt, shoulder at top and turned over flanges at sides for lock seams or joints.



"Anteekcraft" Jumbo Copper Spanish Roof Tile
Light, strong and durable

Standard size of a field unit in place—14½ in. long, 10¾ in. wide, with a center height at butt of 3½ in.

Eave, Sunken Gutter and Valley Construction

The open butts of all field and hip tiles at eaves and top edge of sunken gutters are closed with copper closures soldered in place at the job.

Valley tiles are cut on the job and the open butts are closed with copper closures soldered in place. Standard valley linings are easily applied.

Gutters

All types of gutters such as hanging, moulded, sunken, cornice and parapet wall linings can be easily applied to Jumbo Copper Tile roofing.

Finials and Terminals

Special finials and terminals will be executed in strict accordance with architects designs and arranged to fit our Jumbo Copper Tile roofing.

Snow Guards

Copper wire snow guards placed in valley between rolls of all field tile at the two or three bottom rows at all eaves, form a natural and permanent barrier against sliding snow or slush.

Cast brass stanchions with flange for pipe guards can be easily installed, replacing a whole, or part of a copper tile.

Suggested Specification for Jumbo Copper Spanish Tile Roof

(1) The Contractor shall provide and install over all sloping roof surfaces Jumbo (Lead Coated) Copper Tile as manufactured by Jacob Ringle & Son, 466-472 Grand Street, Jersey City, N. J., in strict accordance with the following specification:

(2) **General**—The Contractor shall examine all surfaces to be covered with (lead coated) copper tile and shall see that all crickets are properly constructed, all surfaces properly graded and in proper condition to receive the copper tile.

(3) **Felt Base**—The Contractor shall provide and lay, over the entire roof surfaces, a single layer of 40-lb. asphaltum felt, extending over all ridges, hips, valleys and under all flashings, etc., securely nailed with tin disc washers and large headed roofing nails in an approved manner.

(4) **Copper Work**—All field tiles, hips, ridges, finials, valleys, flashings, etc., shall be 16 oz. special annealed soft copper (lead coated).

The field tile, hips, ridges and finials shall be formed to secure the true Spanish effect.

(5) ***Field Tile***—Each field tile shall be approximately 16x12 in. overall formed with rolled tapered section, 3½ in. wide valley, 15 in. exposure to the weather, 3½ in. high at center of butt, 1 in. butt with top, bottom and side locks. Each tile to hold down four adjoining tiles.

Each tile shall be securely nailed to nailing base with large head copper nails, two at the top of each tile, and fastened at the side with a copper cleat securely locked and nailed to the base.

(6) ***Hip Tile***—Each hip tile shall be approximately 20½x12 in. overall, formed with rolled tapered section, 17 in. exposure to the weather, 7½ in. high at center of butt, 1 in. butt, shoulder at top and flanged at sides for soldering to the field tile.

(7) ***Ridge Tile***—Each completed ridge tile shall be made in two sections, each section shall be approximately 22½x14 in. overall, formed with rolled section having an interlocking bead at the ends of roll, an apron with two rolled sections to lap and fit over two field tile.

The two sections shall be fastened together at top edge of ridge roll with a standing seam (or lock joint) thoroughly soldered.

(8) ***Finials and Terminals***—All finials and terminals shall be made in strict accordance with the detail drawing and shall be neatly fitted and soldered to all ridges, hips, etc.

(9) ***Finish at Eaves and Valleys***—All butts of field tile at all eaves and valleys shall be closed with (lead coated) copper closures thoroughly soldered.

Note: If sunken gutters are to be used, the words "sunken gutters" should be included in the heading and paragraph above.

Note: The design of the building and the type of roof will govern the balance of the specification. The following headings will suggest the various paragraphs to be added to the above specification to make it complete for a particular job.

Flashings and Linings for Valleys, Dormers, Chimneys, Pipes, Walls, Parapets, Cornices, Cornice Gutters, etc.

Sunken Gutters, Hanging Gutters, Down Spouts, Leaders, Leader Boxes, etc.

Note: The above specification with the addition of the various suggested clauses required to fit a particular job, makes it a complete specification for our Standard Plain (or Lead Coated) Copper Spanish Tile Roof. If our "Anteekcraft" roof is desired insert the following clause in the specification immediately after paragraph 9.

(10) ***Dwarf and Oversize Copper Tiles***—About 10% of total field tile area shall be covered with dwarf and oversize tiles of odd shapes and sizes scattered throughout the roof area to break up the regular straight line effect. No effort shall be made to place them in regular order.

Note: When the roof is of plain copper (not lead coated) the following paragraph shall be inserted at the end of the specification.

Cleaning and Finish—After all the copper has been installed the entire surface of all exposed copper work shall be cleaned and given a thorough coating of pure linseed oil and then allowed to weather naturally. *No artificial coloring or acids shall be employed.*

TRADE-MARK

Full stocks of Wheeling Spanish Metal Tile and Fixtures are carried in a Wheeling warehouse near you. Equally significant is the fact that Wheeling supplies the materials for a complete Spanish Metal Tile Roof—one specification—one uniform high quality.

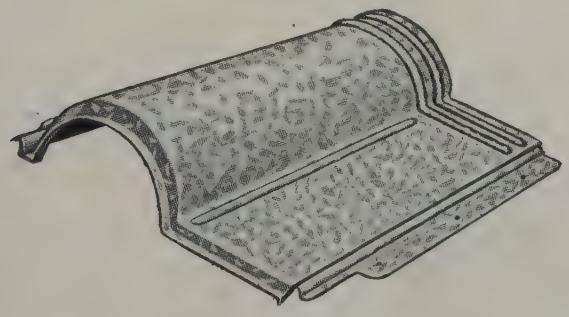
Spanish Metal Tile and Fittings

Due to its rare charm and beauty, the Wheeling Spanish Tile Roof is especially suitable for homes, churches, school buildings, garages and similar structures.

Laying Spanish Metal Tile Roof

Wheeling Spanish Tile and Fixtures are fabricated from COP-R-LOY, the copper alloyed steel. After forming, they are hand dipped in pure molten zinc to thoroughly protect the seams, edges and surfaces.

For a roof of enduring beauty at low cost, specify a Wheeling Spanish Metal Tile Roof. Easy and economical to erect. Rustproof, lightning proof and leakproof. Lowers insurance rates.



Spanish Metal Tile

Wheeling Hand Dipped Zinc Coated Conductor Pipe

Formed from heavy gauge COP-R-LOY, the copper alloyed steel. Hand dipped after forming, in pure molten zinc. The hand dipping process embeds surfaces, edges and seams within a thick, impenetrable, weatherproof, rustproof coating to an extent never before possible in a conductor having the rigid strength of steel.

Wheeling Hand Dipped Elbows

For use with Wheeling Hand Dipped Zinc Coated Conductor Pipe. They are made by the same process and of the same materials.

Specify: "Wheeling Hand Dipped Elbows."

Wheeling Extra Heavy Coated Eavestrough

This is made for use with Wheeling Hand Dipped Conductor to enable the construction of permanently economical roof drainage systems. Manufactured of COP-R-LOY, the copper alloyed steel, with an extra heavy coating of pure zinc.

Specify: "Wheeling Extra Heavy Coated Eavestrough."

Wheeling Steel Ceilings

Wheeling Steel Ceilings continue to be the standard fire-safe ceilings of the country and are manufactured in an extensive range of designs appropriate for every type of room.

They are made with re-pressed beads and die-cut nailholes, which insure perfect alignment and dustproof joints. Wheeling Steel Ceilings are fireproof, sanitary and dustproof. They are carried in stock for prompt shipment at every Wheeling warehouse. For your convenience a large catalogue of designs will be supplied upon request.

Wheeling Hand Dipped Roofing Plates

The base of these roofing plates is COP-R-LOY, the copper alloyed steel and the coating is of pure tin and lead applied by the Wheeling hand dipping process, assuring a heavy and long-wearing protective coating.

Each plate is stamped with the Wheeling trademark, weight of base and coating.

To insure long lasting, fireproof roofing, specify: "Wheeling Terne Plates" which are obtainable with coating weights from 8 to 47 lb. per box.

Hawthorne Roofing Tile—A National Product

Hawthorne

HAWTHORNE Roofing Tile has been developed as a result of years of experience and study of the use of concrete as a roofing material. The originators of this company began with the manufacture of concrete slabs by hand-process, which was later discarded and automatic power driven equipment developed to produce a perfect and uniform tile with a permanently imbedded color coat.

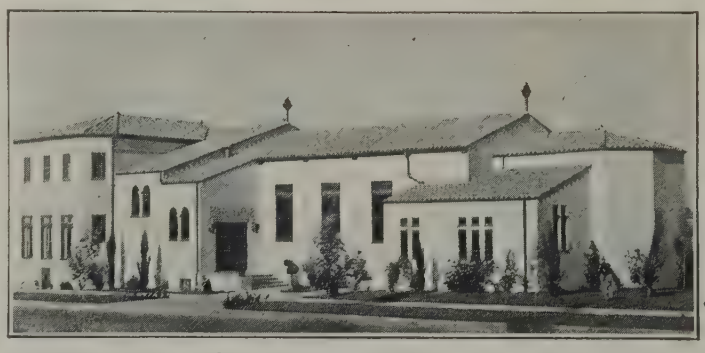
When the HAWTHORNE ROOFING TILE CO. entered the field with this new type of tile, it began to attract the attention of progressive Builders and Architects. Because of the cheapness with which the machines could turn out the slabs it became possible for tile to be used where formerly the price had prohibited it. Today HAWTHORNE Tile is the popular permanent roofing material. There are now ten factories in operation in the United States. This recognition has come only as a result of its following superior qualities:

(1) Permanence—Concrete is known as one of the most lasting of building materials. HAWTHORNE Tile is made from a rich mixture of cement with a fine grade of sand. The curing process, developed after a long period of close observation, prevents the disintegration customary on the surface of ordinary coarse concrete construction. In other words HAWTHORNE Tile is composed of a concrete mixture so cured that it will never wear out. The tile passes all practical strength tests. Once placed on the roof it will not break under normal conditions.

William F. Higginbotham Public School, Detroit, Mich.
N. CHESTER SORENSON & Co., Architects

(2) Economy—The fact that the tile is practically indestructible eliminates the necessity of repeated repairs. Therefore, although the first cost may be somewhat higher than the cheap forms of semi-permanent roofing materials, this first cost is more than saved during the first ten years of the life of the building. Another saving is effected in that the method of laying the tile provides an insulating air space which saves in roof construction and fuel bills.

(3) Utility—HAWTHORNE Tile is absolutely fireproof. Spectacular tests made at our plant have proven that the tile will not burn although the rest of the building may be destroyed. There is absolutely no danger from flying embers.



Messiah Evangelical Lutheran Church, Los Angeles, Cal.
RUDOLPH MEIER, Architect

HAWTHORNE Tile is waterproof. The chemical action which takes place in the rich mixture of concrete when the cement comes in contact with water, renders the tile more waterproof than any competitive type of roofing material. We have on file in our office laboratory tests showing that HAWTHORNE Tile has less absorption than similar types of competitive tile on the market. When the tile is laid according to our specifications, a roof is provided which will keep out driving rain or snow. The fact that our roofing is applied all through the United States proves that it stands up under any sort of climate.

Residence, Kenilworth, Great Neck, L. I., N. Y.
GEORGE BARNES, Architect

(4) Beauty—The growing use of color places a demand on building materials which is not always easy to meet. Beautiful color effects may be produced which are not permanent and attempts to produce a permanent color limit the range to dull effects. After years of intensive experimental work, we have developed a process whereby we impregnate a permanent color surface on our tile. It is now produced in the following fourteen colors:

Dark red	Standard green	Dark Green
Bright red	Pea green	Orange
	Tan	Blue
	Chocolate	Velvet Blue
	Natural gray	Yellow
	Velvet gray	Purple

HAWTHORNE Tile is now made in the following styles:

French, Spanish, English Shingle (Chicago only) and Mission (California only).

It is now possible for the particular architect or builder with an eye to the combined effect of beautiful materials, to select a roof having all the requirements of usage and at the same time becoming a part of a distinctive and pleasing architectural scheme.

Continued on next page

The Method of Laying Hawthorne Roofs

The tiles are laid without the use of nails, and are so designed that they interlock securely in place. They will not become dislodged by wind or vibration. The use of nails in other materials causes cracking at the time of application, and later, due to the shifting of the roof structure.

In those rare cases where an occasional tile may become broken it may easily be replaced by lifting the adjoining tiles and sliding the new one in place.

Edgebrook Country Club, Chicago, Ill.
HALL, LAWRENCE & RATCLIFF, INC., Architects

Hawthorne Tile Used from Coast to Coast

The geographical location of HAWTHORNE Tile plants ensures quick delivery of all orders, large or small, with minimum of transportation expense, to all parts of the country.

Suggested Specification Clauses for Use of Architects Specifying Hawthorne Roofing Tile

All sloping roofs shall be covered with Red (or other color) French [Spanish] HAWTHORNE Roofing Tile of shade approved by the architect and finished with HAWTHORNE special tile at ridges, hips and gables (and eaves in Spanish tile). Specials to be nailed with copper nails. All to be laid in accordance with the Standard Practice of the HAWTHORNE ROOFING TILE CO.

Before laying the tile, roof sheathing is to be covered with an approved slater's asphalted felt weighing not less than 30 lb. per square, securely nailed with flat headed nails, lapped not less than 3 in. at intersections, and doubled at valleys, hips and ridges. All flashings to be installed before tile is laid, and all stucco work, pointing or other finish on dormers and other vertical surfaces that rise above roof to be completed before tile laying is started.

Standard Practice of Hawthorne Roofing Tile Co. for Laying Hawthorne Tile Roofs

Roof framing should be of sufficient strength to support roof tiling. Weight of tile as laid on roof is not more than 8½ lb. per sq. ft. In residence construction 2x6-in. rafters, 20-in. centers are sufficient to support HAWTHORNE Tile on ordinary spans; but, in cases where 2x4-in. rafters are used, it is recommended that collar beams be used to stiffen the roof. It is important that valleys and headers should be of ample size and securely framed together. Rafters should be covered with close sheathing.

As total thickness above roof sheathing to under side of the tile is about 1¼ in., it is necessary to place gable rake boards so they project about 1¼ in. above roof boarding to receive the gable tile, as shown on detail drawings. Total width of this board may be 4, 6 or 8 in., to suit design of roof.

First Baptist Church, Pittsburgh, Pa.

The best method of finishing eaves for French tile is to place a tilting fillet 2 in. high under the first roof board. The lowest tile will then lay right on the roof boarding and set snugly in the gutter. A more common practice is to lay sheathing just as for other roofs; the roofer then sets his lowest furring strip on edge in order to give proper tilt to the tile. This results in the tile showing a little higher above the edge of the gutter. This is not objectionable. In the case of Spanish tile no tilt is required, as eave closer furnished with the tile finishes edge.

Felt—Over the sheathing roofer will lay slater's asphalted felt weighing at least 30 lb. per 100 sq. ft. Felt should be lapped 3 in. or more at intersections and doubled at valleys, hips and ridges, securely nailed down with flat headed nails. Where moulding gutters are used felt should be brought up over back edge of the gutter.

Sheet Metal Work—Before laying any tile, all sheet metal work for flashings, gutters, valleys, etc., should be installed.

Flashings of 16-oz. copper should be used. Roofers often use galvanized iron flashings and valleys, but this is not recommended, as the life of sheet iron flashings is short.

Weeper and Hanger Strips—When all flashings and felt have been laid the weeper strips are placed. They are laid at right angles to the eaves, about 2 ft. apart over the entire roof. Ordinary plasterer's lath are suitable for this purpose. They should be securely nailed to the roof boarding with ⅞-in. shingle nails.

Over weeper strips horizontal 1x2-in. battens or hanger strips are placed. They are placed parallel to the eaves and securely nailed through weepers to the sheathing using 6d wire nails.

Hanger strips must be accurately and evenly spaced in order that lines of the tile may be regular. Before laying strips, roof from eaves to ridge should be measured to determine spacing of hanger strips. Tile are usually laid 12 in. to the weather, but if distance from ridge to eave is not an even number of feet, it will be necessary to slightly increase or decrease spacing of the hanger strips from 12 in. on centers.

It is important that the lines of hanger strips should be absolutely horizontal and that spacing from eave to ridge should be uniform. Roofer usually measures the distance and marks out the lines in chalk before placing these strips.

On all hips and ridges a 1x4-in. strip is set vertically and securely nailed to the sheathing below. Ridge and hip tile are nailed to these, so that their weight does not bear on the roof tile.

In some cases where pitch of roof is very flat or very steep, a 1x4-in. strip is not sufficient to keep ridge and hip tile clear of the tile below or it may bring it too high. In this case, width of strip shall be slightly increased or decreased in order that the hip and ridge tile may set close to the surface of the field tile and yet allow its weight to be carried on the strip.

Tile Laying—Tile are laid in horizontal rows starting at lower left-hand corner; lugs of the tile hook over the hanger strips. Each succeeding tile interlocks with the preceding tile. Upper rows of tile overlap the row immediately below by not less than 2½ in. Gable starters and finishers are used on all gable rakes. If length of roof is not an even multiple of 8 in., the last tile nearest the gable finisher may be cut to fit and gable finisher bedded with cement mortar on to it.

Tile should be neatly and carefully cut to fit hips and valleys. Tile on either side of valleys should be cut so that they show straight parallel lines. Rough and unsightly edges should not be permitted. Edges should be 6 in. apart at all points except in the case of very long slopes (30 ft. or more), in which case width at eaves should be slightly increased and gradually tapered to 6 in. at top.

Hip and ridge tile should be nailed to the 1x4-in. strip and bedded and pointed up with colored cement mortar, using the same color as that used in the manufacture of tile. With Spanish tile, ridge closers and eave closers are used to finish tile at ridges and eaves; pointing at ridges is unnecessary.

Note: The above practice does not apply to the installation of Mission tile as manufactured by the Los Angeles plant. The office of the Los Angeles plant will be pleased to furnish architects with complete details and specifications for laying this tile.

Also manufacturers of Brick of standard colors, shapes and textures. Fireplaces, Steps, Briquettes, Landscape Tile, Garden and Terrace Tile, Heavy Traffic Tile, Non-slip Ramps, Brick and Stucco Inserts, Chemical Stoneware, Cylindrical Spiral Rings.

For Floor Tile, see page B1878.

Roofing Tile

This has increased in use about 400 per cent since the Hood Company began reproducing old European effects in America and emancipating the architect from painted sheet metal effects.

All Europe, even the frigid parts, have shown a preference for natural clay roofing tiles over hard harsh shale and glazed roofing tiles. Their beauty is derived from the aging of the clay tile roofs. In Europe practically all roofing tiles are porous which allows them to enhance their beauty by naturally growing moss and lichen.

The Hood Company has specialized in reproducing authentic European roof tiles, yet, at the same time, make commercial American tiles of shale in natural, fireflashed and artificial green and blue colors.

Textures—Smooth, matt, rugg, sanded, engobe. Vegetating and non-vegetating.

Shingle Tiles

"Old Europe"—Sanded, aged, mellow surface. Vegetating; will grow moss. Reproduced from tiles brought back from Europe.

"Rugby"—Matt, aged. Variety of sizes and thicknesses.

"Yorkshire"—Engobed, subdued reds, aged browns. Capable of wide variation.

"Sussex"—Smooth flat shingle in full range of fireflashed colors.

"Devonshire"—Rugg, fireflashed tans, reds, browns, bronzes and bluish purples.

"Normandy"—Smooth or sanded. Cool subdued clay colors. Vegetating, reproducing roof effects in Northern Europe.

"Dresden"—Rugg, full range, fireflashed, flat rib, light weight interlocking.

Curved Tiles

"Riviera"—Smooth or rugg. Full range mingled flashes resembling autumn foliage.

"Habana"—Smooth, sanded or engobe; will grow moss; straight barrel with body of clay. Colors like old hand-made Cuban tiles.

"Aztec"—Smooth, sanded or engobe, 15 in. tapered with clay body, pastel shadings, vegetating.

"Lombardy"—Smooth, sanded or engobe, 18-in. tapered. True Italian. Range of cool pastel colors. Vegetating.

"Tuscany"—Smooth, sanded or engobe, 18-in. flat Roman pans. Reproduced from tiles brought back from Italy and will grow lichen.

American "S" (Erroneously called Spanish "S")—Pan and roll in one piece. Colors from red through fireflashed.

Specials or Fittings—Necessary authentic fittings furnished with each type. See chart below for size, texture, exposure, weight, etc. Complete data sheets cheerfully furnished on all upon request.

Product

"Imperial" Shale Roofing Tiles.

Description

We manufacture vitreous shale roofing tiles in all standard shapes.

Four regular stock patterns are shown on the page following, in addition to which the "Imperial" Roman, the "Imperial" Greek, the "Imperial" Slab Shingle, the "Imperial" English and other special shapes are manufactured. These are produced in a natural red color or in glazes of almost any color.

Specifications

All pitched roofs shall be covered with "Imperial" (insert name of pattern) tiles made by the Ludowici-Celadon Company with stock fitting suitable for each pattern. The tiles as specified above must be hard burned of ..... color, and in accordance with samples deposited in the office of the architects.

Before the roofer is sent for, the owner or general contractor should construct roofs in strict accordance with plans, sheath the roofs *tight*, have all chimneys and walls above roof line completed, have all vent lines put through roofs, furnish all strips of required width used under hip rolls, furnish any strips that may be used under tile at eaves, and have all scaffolding ready for roofer's use. The metal contractor should have all gutters in place on the roof (gutters, whether box, hanging or secret), to extend over the roof sheathing and run under the felt and tile at least 8 inches and should also have in place all valley metal, the width of which must be not less than 24 inches with both edges turned up ¼ inch, the entire length of the valley. The valley metal to be fastened with clips and never nailed or punctured in any manner. The valley metal must be laid over one layer of felt running lengthwise the entire distance of the valley. The metal contractor must have in readiness all flashing metal used alongside and in front of dormers, gables, skylights, towers, perpendicular walls, also around vent pipes and chimneys, and place same after arrival of the tile roofer and in accordance with the requirements of the tile.

After the roofs have thus been prepared to receive the felt and tile, the tile roofer shall cover the sheathing of the roofs with one thickness of asphalt roofing felt weighing not less than 30 pounds to the square, laying same with a 2½-inch lap and securing in place with capped nails. The felt should be laid parallel with the eaves and lapped over all valley metal about 4 inches and laid under all valley metal about 6 inches.

The roof having thus been prepared, the tile layer is to fasten tile with copper nails. The roofer shall see that the tiles are well locked together and lay smoothly, and no attempt shall be made to stretch the courses.

The tiles must be laid so that the vertical lines are parallel with each other and at right angles to the eaves. The tiles that verge along the hips should be cut close against the hip board, and a watertight joint made by cementing cut hip joint to hip board with elastic cement. Each piece of hip roll shall then be nailed to the hip board, and the hip rolls cemented where they lap each other. The interior spaces of hip and ridge rolls must not be filled with the pointing material.

Above: A Close-up of the Same Roof. Showing Its Pleasing Irregularity

An English-Type House, Roofed with "Imperial" Brittany Shingle Tiles in Dull Reds and Sage Browns

The Brittany Shingle tile illustrated above is one of several types of special shingles made in various colors and textures. With our genuine Hand-Made and Old English shingles, and stock machine-made patterns, we have shingle tiles varying in size from 6x12x⅜ in. to as large as 8x16 x1 in.; furnished in textures and colors to suit requirements

Specifications for Brittany Shingle Tile

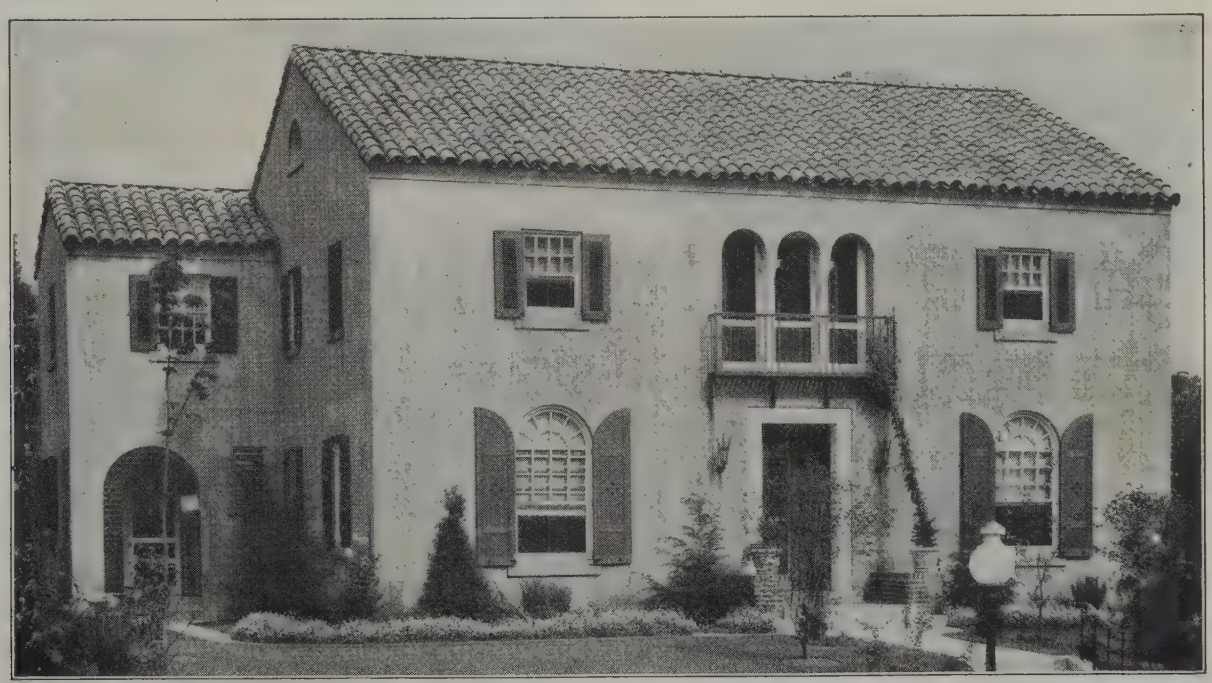
Cover all pitched roofs with "Imperial" Brittany Shingle Tile 6x12x⅝ in., as manufactured by the Ludowici-Celadon Company, in colors as selected by the architect, including appropriate fittings such as ridge, hip, terminals, etc. Hip and valley tile to be cut to the correct pitch in the green before burning and provided with nailholes for proper fastening.

Tile to be laid with some irregularity in exposure to eliminate straight horizontal lines, but not more than 5-in. exposure nor less than 4½-in., in order to insure proper head lap.

Before tile are laid, cover sheathing with best quality asphaltum felt weighing not less than 30 lb. per square (40 lb. on low pitches), laid parallel to eave and ridge and lapped 2½ in.

Apply on hips and ridges 1-in. wood stringers of proper height to carry hip and ridge and use ¾x1-in. cant strips at eaves.

Fasten tile with 1¾-in. copper nails, 2 to each tile. Where tile joins hip stringer, cement cut hip tile to hip board with a good quality elastic cement. Nail hip roll with 2-in. copper nails and ridge with 2½-in. nails.



A Residence Covered with "Imperial" Large Tapered Mission, Ancient Hand-Made

Roman

INCORPORATED 1902

MOUND CITY ROOFING TILE COMPANY

3301 Morganford Road
ST. LOUIS, MO.

Mound City Roofing Tile Is Made of Finest Grade of Shale

Our shale is of the finest grade, making a roofing tile of superior quality and color, burned a solid red throughout at a temperature of 2000 degrees Fahrenheit. Our machinery is the most modern and our plant the most up-to-date in the country.

Colors

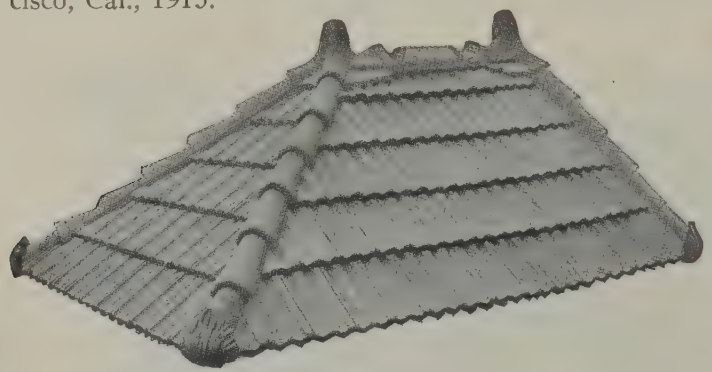
Our tile is made regularly in the various shades of red, also in dull and full green, and brown glazes. Our red tile is called Vitreous Face tile. This class of tile is preferred by a great many architects for several reasons; namely, being vitrified on the exposed surface it will not absorb any moisture from the outside and prevents the possibility of dripping caused through condensation at certain seasons of the year; it will not gather soot and dirt, but remains clean.

We also produce sage, oak, burgundy and sumac shades, which can be assembled with the red, producing the beautiful autumn foliage roofs so much in vogue at the present time. We are equipped to make any shape and color of tile or trimming the architect desires.

Awards

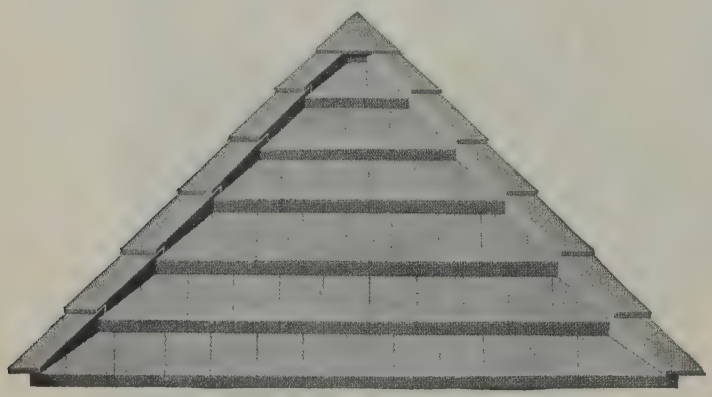
Highest Award, Gold Medal, World's Fair, St. Louis, Mo., 1904.

Gold Medal, Panama-Pacific Exposition, San Francisco, Cal., 1915.



"A" Interlocking Tile

With No. H-5 hip and H-5 hip-starter, No. R-5 ridge and No. T-3, 2-way terminal.
Size of tile, 9x15½ in.
Shipping weight, including trimmings, 1000 lb. per square



Closed Panama Tile

With No. H-8 hip and H-8 plain hip-starter, No. R-6 ridge and No. T-2, 2-way terminal.
Size of tile, 8½x13¾ in.
Shipping weight, including trimmings, 1250 lb. per square

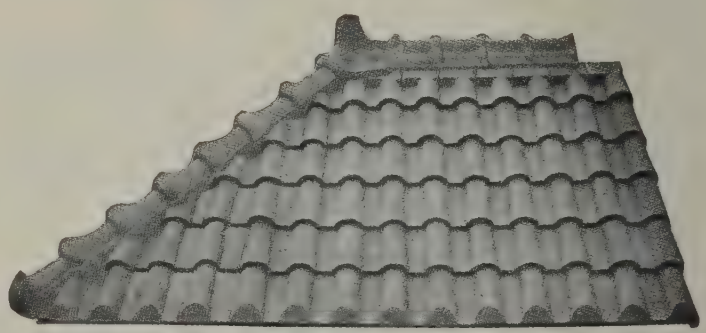
General Specifications

Cover all pitch roofs with one layer of asphalt felt weighing not less than thirty pounds per square. Same to be laid parallel with the eaves, each layer lapped at least three inches and nailed with capped or large-headed nails. The felt shall lap the valley metal at least six inches and on upright walls it shall lap under the tile at least four inches.

The metal contractor shall then place all valley metal, same to be held in place with clips fastened to the metal. The metal shall be bent over 1 by 2 strips running parallel on each side of the valley and must not be punctured in any manner. All eave strips and strips for hips and ridge shall be on hand ready for the roofer.

Cover all roofs so prepared with Mound City hard burned red (or green) ..... pattern tile with trimmings as designated by the manufacturer. All tile to be fastened with copper nails.

No attempt shall be made to stretch the courses. The tile shall be so laid that the vertical lines are parallel with each other and at right angles to the eaves. The tile that verge along the hip shall be cut close to the hip board and a water tight job made by cementing the cut tile to the hip board with elastic cement. The joints of the hips and ridge should be cemented, but the interior space of the hips and ridge must not be filled with the pointing material. After roofer has completed his work he shall remove all broken and damaged tile.



"C" Spanish Tile

With No. H-3 hip and H-3 ornamental hip-starter, No. R-1 ridge and No. T-3, 2-way terminal.
Size of tile, 12½x9½ in.
Shipping weight, including trimmings, 1100 lb. per square

Mission Tile

Size of tile, 15½x7¾ in.
Gauge, 9½x12 in.

Manufacturers of Roofing Tile

CLOVERPORT, KENTUCKY

NEW YORK OFFICE AND STOCK: 656 West 35th Street CHICAGO OFFICE AND STOCK: 1205 South Clark Street

Products

ROOFING TILE, Flat Shingle and Spanish Type.

For Quarry Tile, see pages B1880-1881.

Murray Roofing Tile

Murray Roofing Tile are made from an extremely hard burning shale, impervious to moisture, not effected by the most extreme weather conditions. Roofs of Murray tile after more than twenty years of service, free from roof troubles and repair costs, are today apparently as good as the day applied.

Flat Shingle Tile—*Smooth Red*—Murray reds are distinctively Murray's, a light red, bright and attractive.

Murray Fireflashed—Wide range of autumn colors, smooth surface, bright red body with intermingling of tan, green and purple. Colors are burned in and are permanent, not surface colors.

Murray Rough Velvet—Machine-scored surface, a full range of colors from bright red to dark brown fireflashed, many showing tints of purple and green. The extremely wide color range of this tile offers many opportunities for artistic roofs without loss of permanent roof satisfaction from standpoint of service.

Spanish Type—In plain bright red and full fireflashed range.

Murray Autumn Blend—Distinctively Murray's, a blending of reds and browns, the reds running from light to dark, the browns from seal to chocolate, machine-scored and flame-flashed at high temperatures, producing a pleasing blend with tints of purple, green and tan.

Trimmings—Hips, hip starters, ridges, finials, rakes, eave enclosures and all necessary trimmings made in various styles to fit different designs of tile, including tile cut before burning for hips and valleys.

CON-SER-TEX, a canvas covering for roofs and floors.

CON-SER-TEX CANVAS ROOFING
TRADE-MARK

Con-Ser-Tex Canvas Roofing and Floor Covering

Con-Ser-Tex is a specially woven cotton fabric, scientifically treated by a chemical process making it waterproof and, in addition, preserving the fibre from the ravages of dry rot, mildew germs and the elements. No oil or paraffin is used in our chemical process. The effectiveness of the process is proved by the great endurance of the similarly bitumen soaked mummy cloths of the ancient Egyptians. The canvas is so impregnated that paint will not come in direct contact with the cotton fibre, thus preventing the detrimental oxidizing action of the oils in paint.

Both sides of the canvas are finished with a "tooth" to which paint readily adheres.

Cotton duck, while desirable for many reasons as a roofing and floor covering, has not been entirely satisfactory because the cloth split, buckled and rotted in a short time. Investigation revealed this condition as being due to mildew, occasioned by the exposure of the duck to the elements owing to the checking of the paint —also the burning of the cotton fibre by the oils in paint.

An Ideal Covering for Roofs and Floors

Con-Ser-Tex being a specially woven, chemically treated, tough cotton duck meets the exacting requirements of an ideal covering for roofs and floors of porches, sleeping balconies, of residences, schools, hospitals, sanitariums, etc.; for floors of kitchens, laundries, garages; also used for the lining of wood gutters, valleys and hips, and flashings. Recommended for roof gardens or where the roof is often used as a recreation and dancing floor.

Con-Ser-Tex is so woven that there is absolutely no tendency to curl, as is the case with ordinary cotton fabrics. It lies flat permanently, will never split, not even under severe vibration or strain. It is comfortable under foot and may be turned up to form a sanitary, vermin and waterproof base, integral with the floor.

Con-Ser-Tex is soundproof, non-heat-radiating and is a non-conductor of heat and cold.

Durability Proved Through Service

Con-Ser-Tex is more durable than ordinary wood shingles or tin, and nearly as durable as copper. The durability of Con-Ser-Tex has been proved by the many years of service it has rendered to the largest transportation companies, which have used it exclusively for passenger car roofing.

Con-Ser-Tex has found wide use in every climate and for every class of service with complete satisfaction.

A Lower Grade of Lumber May Be Used

In the construction of exterior and semi-exterior wood floors* it has been customary to use clear pine owing to its durable nature. Con-Ser-Tex will permit the use of a lower grade of lumber, as it protects the lumber from the action of the elements, and a surface so covered will have greater life than would an unprotected clear pine surface.

Easily and Quickly Laid—Conserves Labor

Con-Ser-Tex is easily and quickly laid, consequently it effects great savings in time and labor. *See methods of laying and flashing on plate of details opposite.*

How to Lay Con-Ser-Tex

Dress the surface by eliminating rough places and sharp edges, after which apply a heavy coating of white lead thinned in linseed oil as a bedding (see Note). Over this bedding (while still wet) lay the Con-Ser-Tex, slightly stretching it so as to insure a close adhesion to the surface, taking care to arrange laps so as to permit free drainage.

If Con-Ser-Tex is to be laid in parallel courses with the building, the strips start from the outer or lower edge of the surface to be covered. Con-Ser-Tex should be turned up or flashed 4 to 6 in. at walls to insure a watertight result.

While Con-Ser-Tex is stretched, fasten with galvanized or copper tacks 4 in. apart on edge to be lapped, and then apply the next strip, allowing a lap of not less than 1½ in., fasten with tacks ¾ in. apart.

*All wood surfaces to be covered with Con-Ser-Tex must be tongued and grooved stock. Shiplapped stock should not be used under any condition.

Centenary M. E. Church, South, Chattanooga, Tenn.
Con-Ser-Tex is giving satisfactory service on the large roof garden floor

Club House, Empire City Race Track, Mt. Vernon, N. Y.
Con-Ser-Tex is giving service on the porch floor and roof

Continued on next page

After Con-Ser-Tex is laid and set, apply a light coat of good quality lead and oil paint, and a heavy second coat of best grade Deck paint after the first is thoroughly dry.

Note: If desired, we can furnish a special bedding paint which has greater adhesive qualities than ordinary white lead and oil.

Grades of Con-Ser-Tex

Grade E—A light weight grade, suitable for roofing small porches and for floors where traffic is light.

Grade G—A medium weight grade, suitable for larger porch floors and roofs on residences and public buildings.

Grade I—The heaviest grade, used principally for public buildings and all places where severe conditions exist.

Reasonable in Cost

The first cost of Con-Ser-Tex is reasonable and its upkeep practically nil, requiring painting only as often as the rest of the building.

LIST PRICE OF CON-SER-TEX PER LINEAL YARD

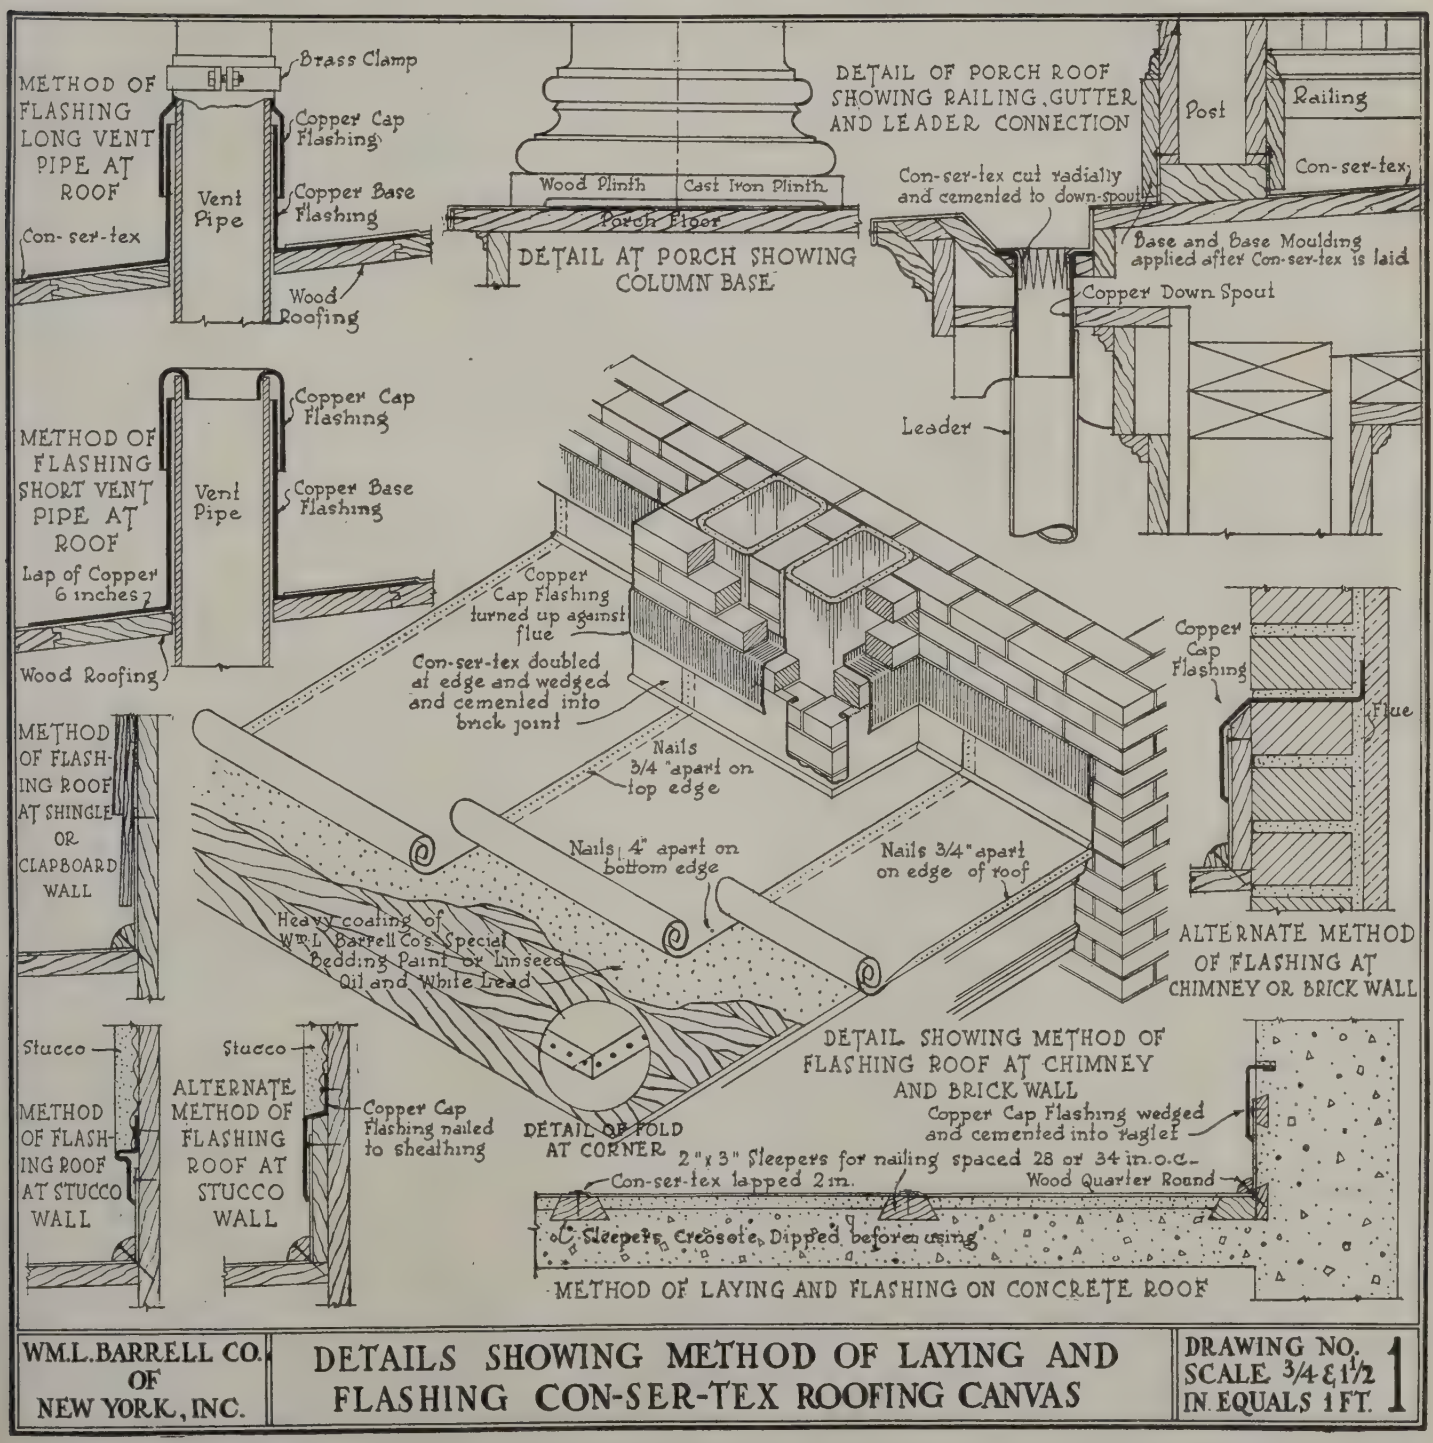
Width, in.	Grade E	Grade G	Grade I
30	$1.17	$1.38	$1.47
36	1.39	1.60	1.78

Discounts furnished on request. The above widths carried in stock. Other widths processed to order.

Consult Us Regarding Economical Laying

On receipt of dimensions of the surface to be covered, we will submit an estimate of cost, also a diagram showing the most economical method of laying Con-Ser-Tex, eliminating to the greatest possible extent all waste in cutting.

There is no charge for this service.



THE BARRETT COMPANY

Flashings for Brick and Concrete Walls

40 Rector Street
NEW YORK, N. Y.

For Branch Offices, see page A436

Products

FLASHING BLOCK for Brick Walls (Patented), FLASHING FORM for Concrete Walls (Patented), PLASTIC ELASTIGUM for Flashings.

For Roofing, see pages A436-438; for Roof Leader and Roof Vent Connections, see page C2769. For detailed description and specifications, see Volume III, Barrett Architects' and Engineers' Built-Up Roofing Reference Series.

Essential Features of Barrett Flashings

Barrett Flashings, which are the result of nearly three-quarters of a century of successful roofing experience, embody all of the following essential features: (1) They provide amply for expansion and contraction. (2) Their elasticity takes care of settlement or shrinkage. (3) All joints are watertight under every weather condition. (4) They will not pull away from either roof or wall. (5) They are practical and easy to install. (6) They are adaptable to every complex wall construction. (7) They are durable and require no maintenance or repair. (8) They eliminate division of responsibility between contractors. (9) Their cost is moderate.

Barrett Flashing Blocks and Flashing for Brick Walls

These blocks provide a permanent, upwardly inclined flashing groove in the wall, which performs the function of a cap and weather protection for the flashing. This cap, being an integral part of wall, is as permanent as the wall itself, and can not become detached.

The flashing material is installed over one unbroken plane, eliminating the buckling, tearing, pocketing, and special wear which so frequently occur where flashings are set in at right or acute angles. The cant construction provides support from below throughout the extent of the flashing, hence there is no strain from wind and gravity.

For detailed specifications see Volume III, Architects' and Engineers' Built-up Roofing Reference Series.

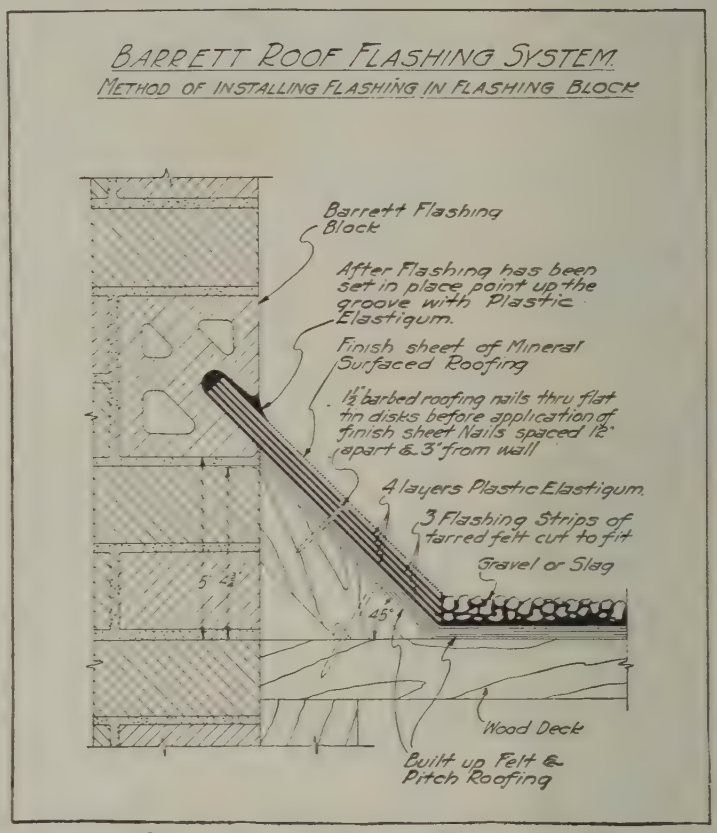


Diagram Showing Barrett Flashing Blocks and Flashing for Brick Walls

Barrett Flashing Form and Flashing for Concrete Walls

This flashing form is identical in principle with the flashing blocks described above. The metal flashing form, shown at right, provides a permanent, upwardly inclined flashing groove in the wall, which performs the function of a cap and weather protection for the flashing. This cap, being an integral part of wall, is as permanent as the wall itself, and can not become detached.

The metal flashing form is not intended to be permanent, its only function being to shape or create the flashing groove. It is left in the wall merely as a matter of convenience.

The flashing material is installed over one unbroken plane, eliminating the buckling, tearing, pocketing, and special wear, which so frequently occur where flashings are set in at right or acute angles. The cant construction provides support from below throughout the extent of the flashing, hence there is no strain from wind and gravity.

For detailed specifications see Volume III, Architects' and Engineers' Built-Up Roofing Reference Series.

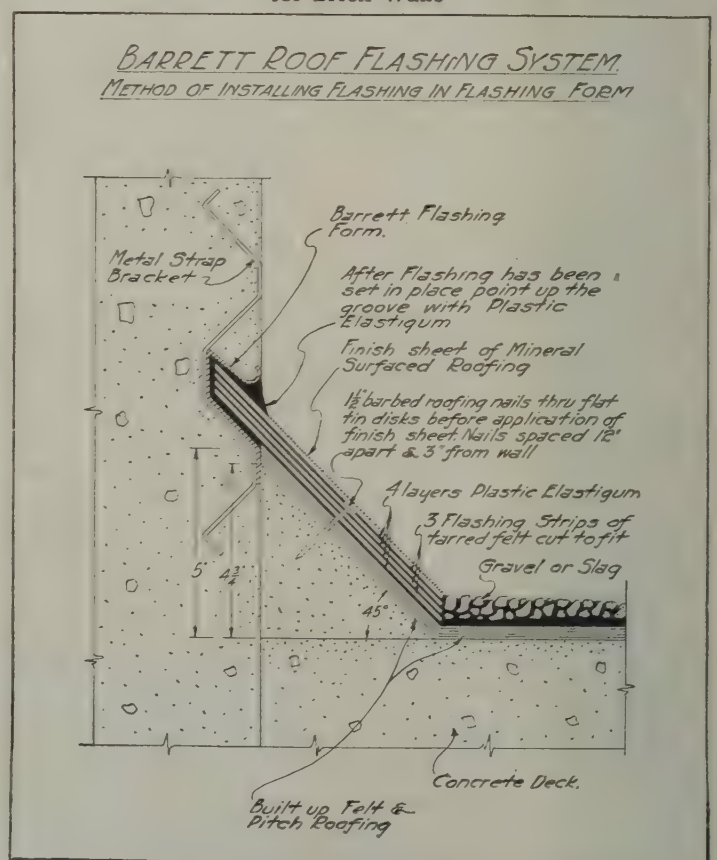

Diagram Showing Barrett Flashing Form and Flashing for Concrete Walls

THE CHENEY COMPANY

Manufacturers of Interlocking Wall Flashing

317 Grove Street, MELROSE, MASS.

Cheney Interlocking Wall Flashing

Does not break the bond. Prevents efflorescence.

A through copper flashing for masonry walls that makes a perfect bond in every direction when built into the mortar bed between two courses of masonry. Cheney Interlocking Wall Flashing is keyed both ways, the keyed edges hooking together to make a continuous waterproof flashing and a perfect mechanical bond clear across a solid brick wall.

A *positive stop* for all seepage troubles at the following points:

Parapet walls	Lintels
Cornices	Set-back bases
Sills	Spandrels

No Lost Time—Mason carries wall up to point where flashing is required, sets flashing in mortar and proceeds—no sheet metal trades are involved in placing same, as it is interlocking and absolutely eliminates all soldering and fitting.

Economical—In cost and application. Made of copper and is not affected by moisture, lime, or cement. Keys are formed on a regular machine and are absolutely uniform. Special pieces are furnished for all corners.

Standard Sizes and Types—All strips are 40 in. long and weigh about 1 pound per sq. ft.; all widths from 4 to 36 in.; special strips of any design on order.

Type 1—For use above the roof line under copings and over Barrett Flashing Blocks. Also for use below the roof line under cornices and sills and over lintels, by extending beyond inside face of wall 1 in. or more and bending up after mortar is set so that water collecting on the flashing can not run into the building.

Type 3—For use above the roof line as a combined through wall flashing and 4-in. counterflashing all ready for roofer to install base flashing. Also for use in penthouse, chimney, skylight and party walls by extending beyond inside face of wall 1 in. or more and bending up after mortar is set so that water collecting on flashing can not run into the building. Can also be bent down ½ in. or more on outside face under coping stones. The flattening of the keys of the 4-in. counterflashing materially strengthens this face so that it can be lifted and bent down again so as to hug the wall smoothly.

Specification

Flashing (For Masonry Specifications)—Cheney Interlocking Wall Flashing shall be used for all through-wall flashings, as shown on plans, and shall be furnished and placed in wall by Mason Contractor. Flashing shall be set with mortar below and on top of flashing, so that a mechanical bond is obtained. (The Cheney Company, 317 Grove Street, Melrose. Mass.)

Special Consulting Service

The scientific knowledge and practical experience of our Research and Building Service Departments are at your disposal at all times.

We will be glad to consult with you on any problems pertaining to the uses and applications of Copper, Brass and Bronze.

Our service covers constructive information about flashings and roofings, preparation of details, preparation of specifications, personal consultation with architects and contractors, and complete technical and scientific information about the physical and chemical properties of Copper, including its coloring. Architects are invited to use this service freely for technical advice on all uses of Sheet Copper—for cornices, eaves troughs, flashings, gutters, leaders, skylights, ventilators, and sheet, shingle or Spanish tile roofing.

COUNTER-FLASHING RECEIVER CO.

Manufacturers of Permanent Leakproof Flashings

712 Park Street, MILWAUKEE, WIS.

AGENTS IN ALL PRINCIPAL CITIES

Product

SCHNEIDER COUNTER-FLASHING RECEIVER, a permanently built-in, leakproof metal raglet for masonry parapets and walls. Receives and securely holds, without calking, the standing flat-roof counter-flashing. Fully protected by patent.

Materials

16 ounce, cold rolled copper. 26 gauge galvanized Armco iron. Furnished in 8-ft. lengths.

Adaptability

Adapted to all classes of buildings with flat or slight pitch composition roofs such as those of industrial and commercial buildings, hotels, apartments, schools, etc.

Advantages

Furnished and installed by mason. Flashing receiver is furnished and built in by the masonry or general contractor with little labor cost as the masonry work of parapets and walls progresses.

Permanence—Made up of non-corrosive metals, it lasts as long as the masonry walls. Permits the removal and replacing of counter-flashing without injury to the receiver.

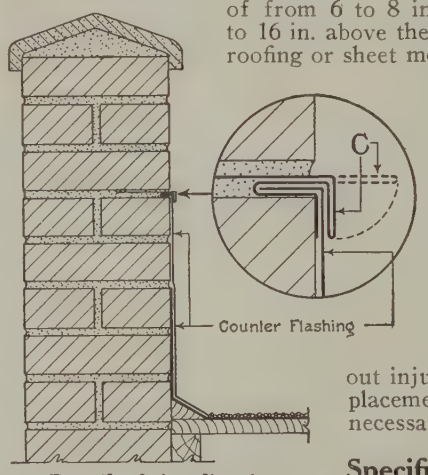
Leakproof—Most roof leaks occur at or about the flashing against parapets and walls. The counter-flashing when set with its top flange inserted in a cut out mortar joint secured with flashing hooks and calking cement is far from permanent and is the vital point where leakage occurs.

The turn-up at the back of the Counter-flashing Receiver body, not only securely anchors the receiver in the masonry mortar joint, but it permanently prevents wind driven rain or the water from melting banked snow from passing over the receiver body, and penetrating through the mortar joint to the interior of the wall to appear on the walls and ceilings beneath with resultant costly damage.

This positive and permanent assurance against leaks at this most vital point is a prime reason for the inclusion of the receiver on all buildings where counter-flashing is required.

Easily and Quickly Installed—Furnished in convenient lengths of 8 ft., the Counter-flashing Receiver is easily handled and quickly installed by the mason without special tools or skill in metal working.

Reduces Labor Costs—Eliminates the usual labor costs of roofing and sheet metal contractor in cutting out the mortar joint to receive the counter-flashing flange and the initial cost of flashing hooks and calking cement, and the labor of installation.



Detail of Application

Application

The Schneider Counter-flashing Receiver is furnished and set by the mason in the masonry mortar joint. The body of the receiver (A) is set level in the wall with the guide flange (E) pressed close against the vertical masonry face. Splice plates with turn-up at back edge, are furnished to fit snugly into the splicing plate groove (F) to firmly join abutting ends in perfect alignment. Corners and re-entrant angles are easily made without intricate fitting or special tools. On roofs with considerable pitch the receiver is installed in steps maintaining a minimum of from 6 to 8 in. and a maximum of 12 to 16 in. above the roof surface. After the roofing or sheet metal contractor has set the counter-flashing with its top flange inserted in the counter-flashing groove (D), he bends down the projecting flange (C) securely locking the counter-flashing in place, yet allowing for its normal and natural expansion and contraction. The locking flange (C) is easily lifted and re-bent to its customary position without injury when removal and replacement of counter-flashing is necessary in reroofing.

Specification

Include in Masonry Specifications—The Mason Contractor shall furnish and build into all parapet and similar walls where counter-flashing is required [copper] [galvanized armco iron] Schneider Counter-flashing Receiver as manufactured by the COUNTER-FLASHING RECEIVER Co., Milwaukee, Wis.

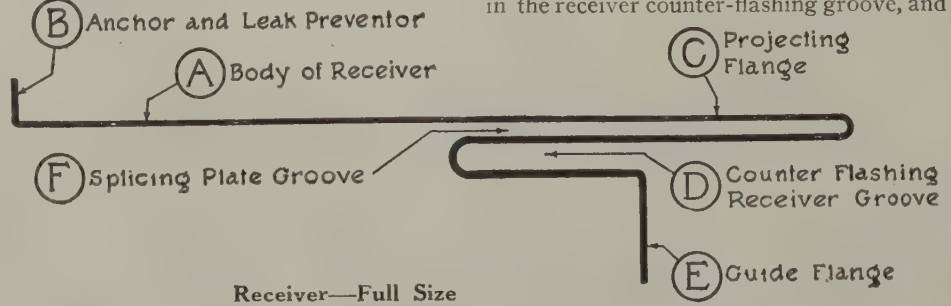
The Counter-flashing Receiver shall be set in the masonry mortar joint in accordance with the manufacturer's details. Butting end joints shall be secured in perfect alignment with splice plates, furnished by the receiver manufacturer, and all corners and re-entrant angles shall be lapped and joined as shown.

The receiver shall be set in a mortar joint approximately 9 in. at its lowest point from the roof level. Where steps are required by changing roof level, these shall occur at points where the maximum height above the roof surface is approximately from 12 to 16 in.

Include in Roofing and Sheet Metals Specification—[Copper] [galvanized armco iron] Schneider Counter-flashing Receiver is furnished and built in by the Mason Contractor (see page ... of specifications and details). This contractor shall insert the top flange of his [copper] [galvanized armco iron] counter-flashing in the receiver counter-flashing groove, and bend the projecting receiver flange over the counter-flashing top.

Note: No counter-flashing hooks or calking cement are required.

Note: To prevent electrolysis, the receiver and counter-flashing must always be of the same metal, i.e. copper receiver—copper counter-flashing; galvanized armco iron receiver—galvanized armco iron counterflashing.



Receiver—Full Size

THE FIGGE COMPANY

Manufacturers of the Patented Figge Roof Flashing

1110 West Adams Street

CHICAGO, ILL.

Product

FIGGE PATENTED ROOF FLASHING for all types of built-up roofings.

Figge Roof Flashing

Figge roof flashing is manufactured for the one purpose of permanently protecting the vital point in built-up roof construction.

Architects recognize that 95% of roof leaks develop in and around the flashing.

Figge flashing is furnished complete in two weights —two-ply and three-ply—the material is woven fabric thoroughly saturated with bituminous compound. The life of the Figge flashing is equal to the best built-up roof constructions. There are no nails to rust, no wood to rot, no crevices for water seepage. It forms a solid, permanent waterseal between the wall and the roof. Figge flashing presents perfect flexibility working perfectly into corners and uneven mortar courses.

How to Specify

Figge flashing requires a raggle which is formed by raking out the mortar joint between brick. This raggle should be 1½ in. deep and at whatever height desired. It can be taken care of in mason specification where it is raked out before it sets or can be taken care of by the roofer. Wherever concrete is used a raggle can be provided by a wood strip nailed on to the form. Under roofing specifications have subheading:

Roof Flashing—The roof flashing shall be Figge Flashing applied according to manufacturers' directions.

Specify either Two-ply, Three-ply, Standard or Extra Heavy and the width. Specify either 6, 8, 10 or 12 in.

The flashing should extend out on the roof from 1 to 2 in., to reinforce angle between roof and wall so that if necessary to flash up on the wall 6 in., specify 8 in. wide flashing. If necessary to flash up on the wall 8 in. specify 10-in. wide, etc.

How Packed

Figge flashing is packed in specially designed cartons of tough and durable fiber board which assures flashing arriving on the job in perfect condition. Each carton is labeled properly with type and size clearly shown, bound with heavy steel strapping. Direction sheet in each package.

Package contains 100 lin. ft.

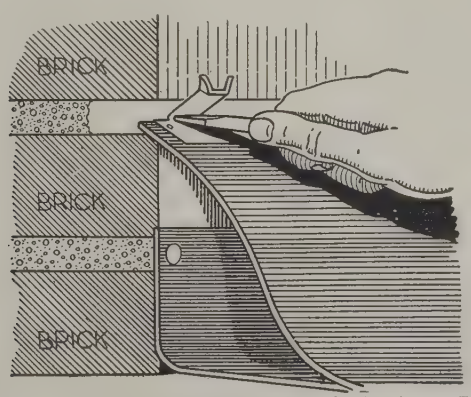


Fig. 1—Provide raggle 1½ in. deep at required height. Place flashing so that corrugation in device is in center of raggle. Place screwdriver or flat piece of metal at corrugation in securing device and push into raggle

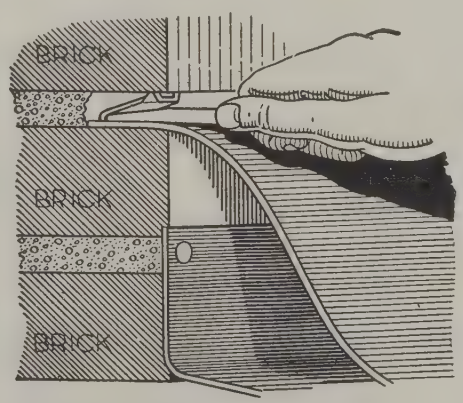

Fig. 2—When securing device in place press down so that it takes on position shown in Fig. 2

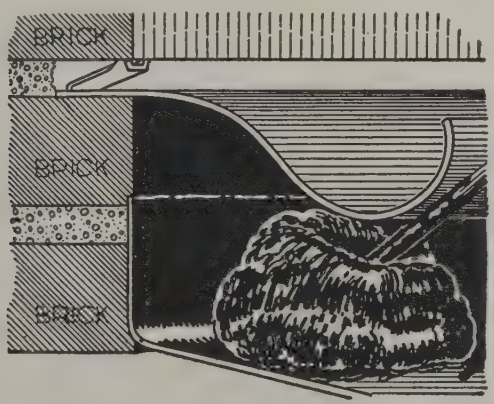

Fig. 3—Cement flashing to wall and turned-up portion of roof cover ing. Care should be taken here to prevent wrinkles

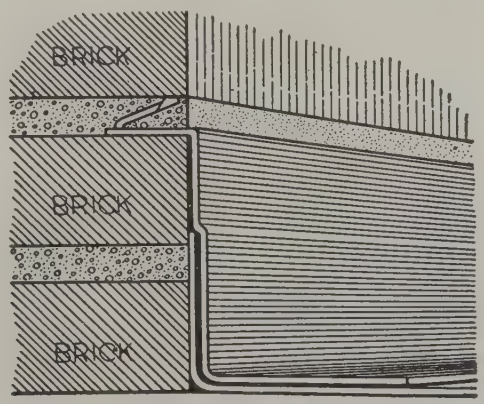

Fig. 4—Point up raggle with a rich mixture of portland cement mortar, or asphalt roof cement. In using asphalt roof cement stiffen with portland cement to form a mastic consistency. Then apply a coating of bituminous cement over entire exterior of flashing

ESTATE OF J. G. HETZEL

CABLE ADDRESS
"HETZEL, NEWARK"

Manufacturers of Roofing Cements and Paints

67 Maine Street, NEWARK, N. J.

Products

HETZEL'S ELASTIC ROOF CEMENT for all roofs, glass skylights, coping stones, etc.

HETZEL'S INSULATION CEMENT.

HETZEL'S PLASTIC ROOF COMPOUND and FIBROUS KOTING.

HETZEL'S ELASTIC CALKING COMPOUND.

HETZEL'S PIPE JOINT COMPOUND.

HETZEL'S DAMP RESISTING PAINT for brick walls.

Also Hetzel's Asphalt Paints; Hetzel's "Rub-on" Roofing Paint; Hetzel's Enamel Paint for boiler fronts and steam pipes; Hetzel's Acidproof Paint for metal work, ammonia tanks and gas tanks; Hetzel's Structural Paint for exposed surfaces.

TRADE-MARK

Hetzel's Elastic Roof Cement

Hetzel's elastic roof cement, in use throughout the United States and Europe for many years, is especially valuable for covering and repairing all holes, cracked joints, breaks, or leaks in roofs of all kinds. Used also for pointing around chimneys, skylights, and dormer windows; for repairing coping stones, gutters, wood and stone work which require to be made watertight; for laying and bedding slate and tile roofs.

Asphalt shingles laid in Hetzel's cement will not curl, nor can snow or rain blow under them.

Colors: brown, gray, black, white, green and red. It is also made to order to suit every purpose, and is the only slaters', tinners' and tile roofers' cement.

Hetzel's elastic roof cement is equally well adapted for use on slate, tin, asbestos, glass, wood and metal roofs; is permanent; does not run or loosen from joints or cracks, and is not affected by any extreme of temperature or climatic changes. It does not harden, but preserves its complete elasticity even when exposed to extreme heat, cold, dryness or humidity.

Hetzel's Insulation Cement

For applying Celotex or insulating material.

Applied cold, requires no heating. Eliminates kettles and consequent dirt and soot. Superior to pitch or asphalt for this purpose.

Hetzel's Plastic Roof Compound and Fibrous Koting (Liquid)

Specially prepared compounds for repairing and painting old wood, tin, iron or felt roofing; for repairing leaky chimneys; for waterproofing walls below and above grade, etc.

Hetzel's Elastic Calking Compound

For pointing window frames, hothouses, steel sashes, crevices, cracks in masonry, etc. Remains elastic indefinitely. Will not crack or dry up. Far superior to lead or oakum. Does not contain asphalt or coal tar. Can be painted over with any color. Also made in special consistency for use in guns.

Colors: white, gray, green, black and red.

Pipe Joint Compound (Red, Gray and White)

For joints of gas, steam, water, and air pipes. Will not harden, and prevents joints from rusting. Makes absolutely tight joints which can be disconnected at any time without injury to fittings.

Hetzel's Damp Resisting Paint

A compound black paint for dampproofing foundations and walls above and below grade. When applied to inner side of exterior walls, forms a good dampproof surface for direct application of plaster, rendering plaster stainproof, and saving cost of furring and lathing.

Specifications Hetzel's Elastic Roof Cement

All nailholes and joints between the slates shall be sealed with Hetzel's Elastic Roof Cement as manufactured by the ESTATE OF J. G. HETZEL, Newark, N. J., in such quantities as to hold the slates in position should they break, or the nails rust away. (Fig. 1.)

The joints of all tiles shall be sealed with Hetzel's Elastic Roof Cement as manufactured by the ESTATE OF J. G. HETZEL, Newark, N. J. To prevent leaking, the hip and ridge rolls shall be sealed in a like manner. (Fig. 2.)

All cap flashings shall be carefully pointed up with Hetzel's Elastic Roof Cement as manufactured by the ESTATE OF J. G. HETZEL, Newark, N. J. (Fig. 3.)

The joints of all copings shall be set and sealed with Hetzel's Elastic Roof Cement as manufactured by the ESTATE OF J. G. HETZEL, Newark, N. J. (Fig. 4.)

SERVICISED PRODUCTS CORPORATION

6051 W. 65th Street

CHICAGO, ILL.

Products

WALL COPING; FLASHING BLOCK; WALL APRONS.

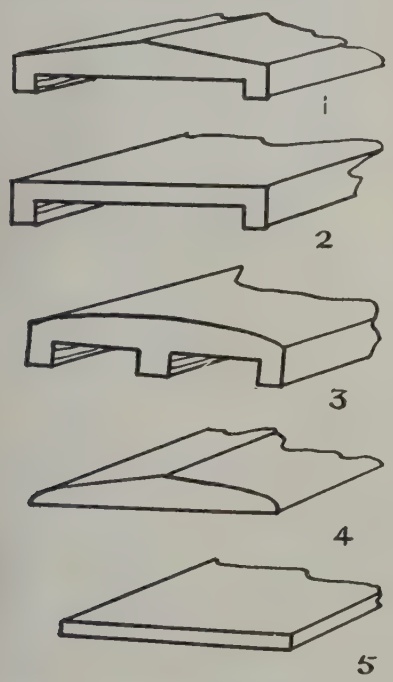
For Expansion Joints, see page A131.

For Ridge Strips, Asbestos Cement or Slate Roofing, Saturated Felt, Roofing Asphalt and Roof Coating, see page A455.

For Insulation, Roof Cement, Asphalt Paint and Industrial Flooring, see page B1996.

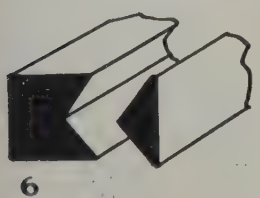
For Sewer Liners, Caulking Belts, Sewer Pipe Compound and Bitupack, see page C2737.

Servicised Wall Copings



These are highly resilient, absorb shock and are free from breakage. They comprise a bituminous and linear fiber mixture with a mineral content. They are prepared in various shapes and sizes, and are particularly adapted for waterproofing walls more effectively than brittle substances. The joint can be more effectively sealed and consequently guarantee a better waterproof seal over the wall. Different types of coping are shown and numbers should be utilized in writing, giving wall thickness so that proper widths can be determined.

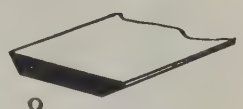
Servicised Raggle Block

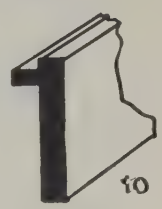


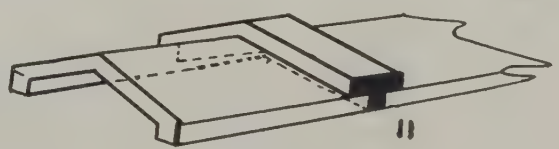
This is a block adapted to fit into the wall, it is prepared from bituminous material, felt fiber and mineral matter. It is especially designed to completely enclose the roofing joined with the wall, and inasmuch as the material from which the raggle block is prepared has the same ratio of expansion and contraction as the roofing, a better joint can be affected and maintained over a period of time. The use of Servicised Raggle Block guarantees an absolutely watertight wall connection.

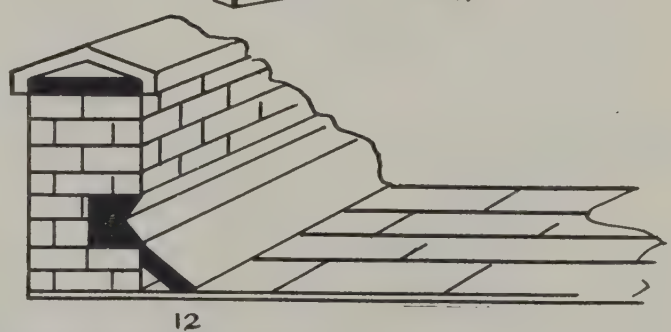
Servicised Coping Slabs

These are prepared to underlie the coping, or are adapted to underlie vitrified coping where the asphalt composition coping is not utilized. It forms an exceedingly waterproof separation between the coping stones and the wall proper, and can be fabricated with depending projections on the sides so that the top of the wall is capped with a waterproof sheet. Where it is made in channel or cap form the larger size coping stone would have to be employed to make allowance for at least ½ to 1-in. thickness on either side of the wall for the overhang.









Servicised Wall Aprons

These are designed to be suspended from the coping stone to the flashing block for the purpose of preventing moisture penetrating the wall structure above the roof.

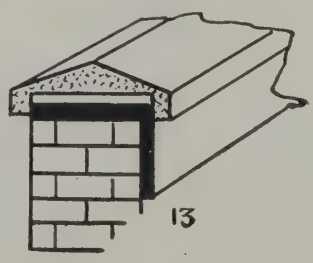


Illustration of Raggle Block, Cant Strip, Wall Coping and Coping Slabs in Place before Placing Roofing

BERGER BROTHERS COMPANY

Gutter Hangers and Conductor Pipe Fasteners

229-237 Arch Street, PHILADELPHIA, PA.

Products

GUTTER HANGERS and CONDUCTOR PIPE FASTENERS, of malleable iron, wrought iron, solid cast bronze and copper channel.

Also a general line of Sheet Metal Workers' Requirements; "Shurlock" Conductor Pipe and "E-Z" Fit Eaves Trough; "Quaker City" line of Mitres, Ends, Caps and Outlets.

Exclusive manufacturers of Octagon and Polygon Conductor Pipe.

TRADE -B B- MARK

Our registered trade-mark appears on all products manufactured by us. This mark represents dependability, durability and strength and protects the purchaser against inferior imitations.

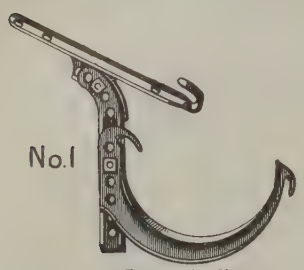
When specifying, full protection is assured by insisting that our trade-mark appear on every piece.

How Furnished—Made of malleable and wrought iron, plain or tinned (plain furnished unless otherwise specified), solid cast bronze and copper channel. All shanks and circles interchangeable. One bolt included with each hinged shank. Hinged shanks are adjustable to any pitch of roof. Shanks may be lengthened with our extension shanks.

Free samples on request.

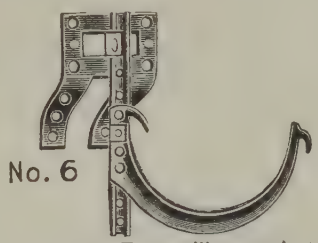
The Mark of Quality Which Protects the Purchaser

We are the originators, designers and manufacturers of the best grade of gutter hangers and conductor pipe fasteners on the market.

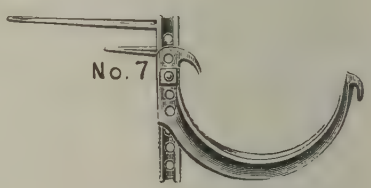


No. 1. Clamped direct to metal roof, requiring only one bolt through the iron. Especially suitable for awnings and corrugated roofs

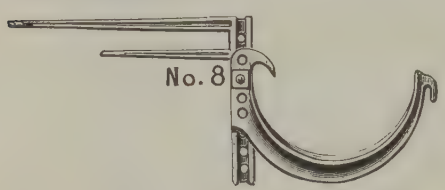
No. 5. Will span over various shaped mouldings and is easily bent larger or smaller before nailing to eave



No. 6. For nailing against O. G. mouldings. The two stays are made to fit in the cove and can be bent to suit variation

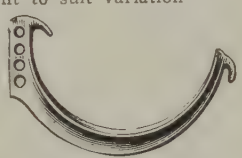


No. 7. For driving from 3 to 4 in. square in cornice. Lower prong forms a brace for the upper and makes it strong and firm



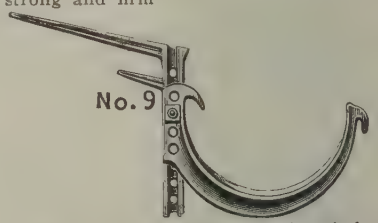
No. 8. For driving from 3 to 6 in. square in cornice. Intended for eaves where shingles project over the cornice

Penn Gutter Circle
For double bead gutters. Sizes, 3½, 4, 4½, 5, 6, 7 and 8 in.



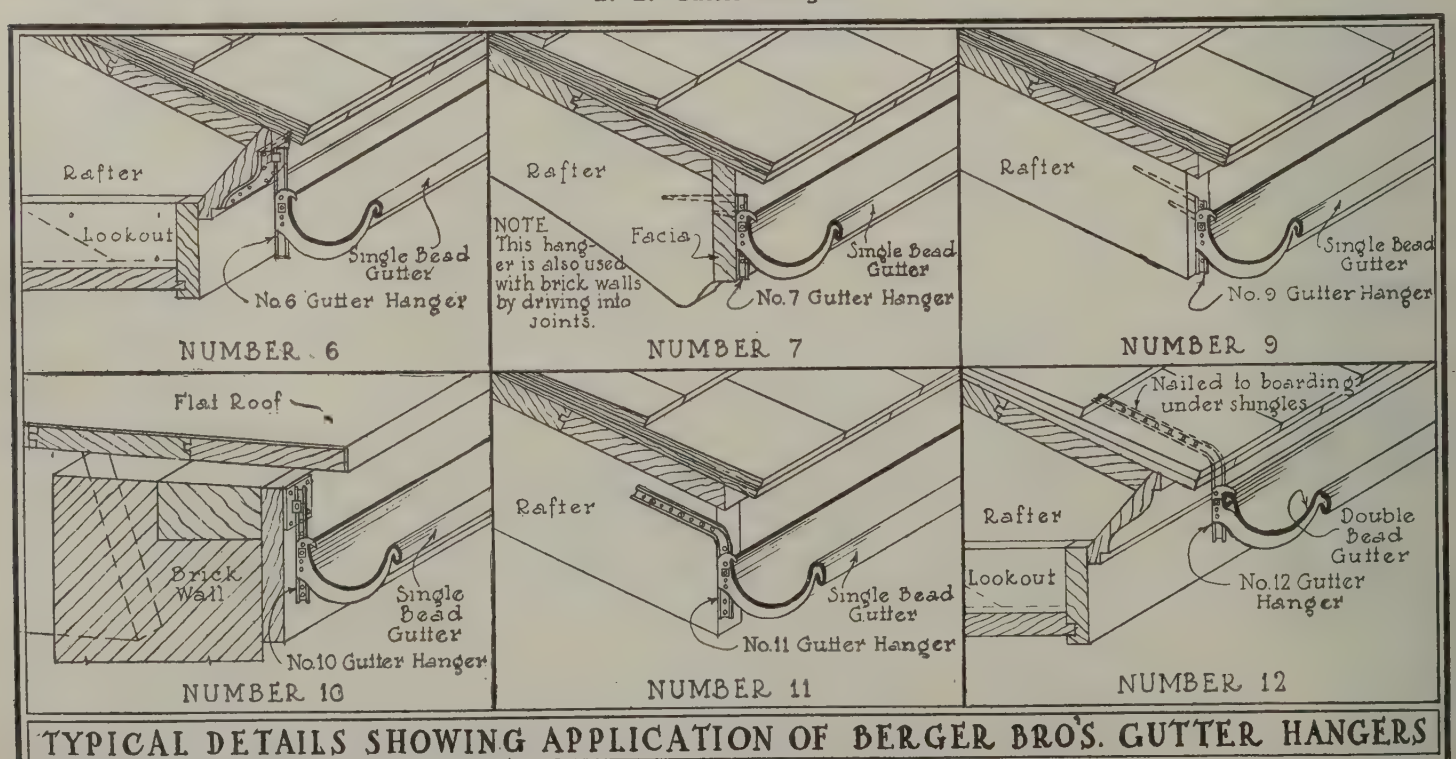
Gem Gutter Circle
For single bead gutters. Sizes, 3½, 3¾, 4, 4½, 5, 6, 7 and 8 in.

Circles are applicable to any B. B. hanger



No. 9. For driving with the pitch of the roof. Suitable for narrow moulded cornice

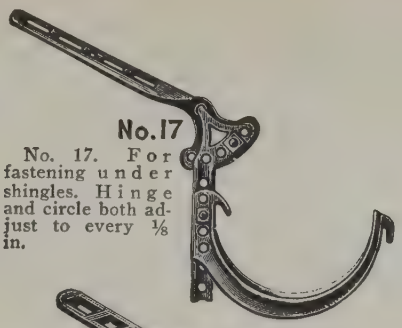
B. B. Gutter Hangers



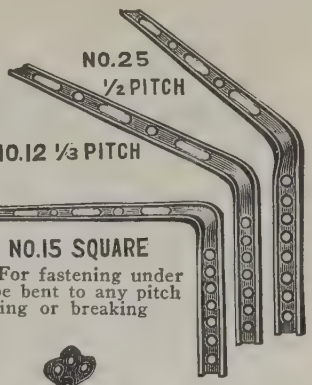
TYPICAL DETAILS SHOWING APPLICATION OF BERGER BRO'S. GUTTER HANGERS

Continued on next page

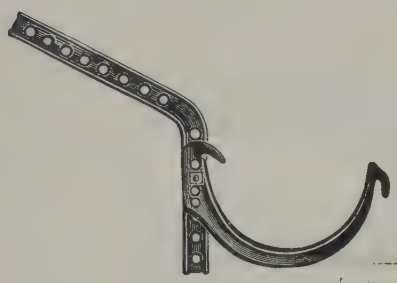
No. 10. For nailing against square box cornice



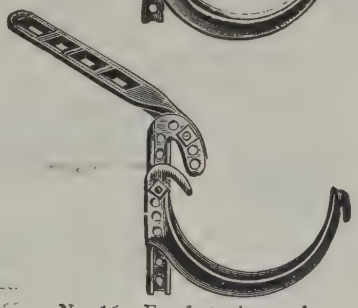
No. 17. For fastening under shingles. Hinge and circle both adjust to every ⅛ in.



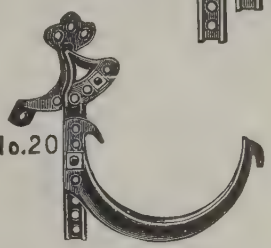
Nos. 12, 15 and 25. For fastening under shingles or slate. Can be bent to any pitch of roof without weakening or breaking



No. 11. For nailing to the side of exposed rafters



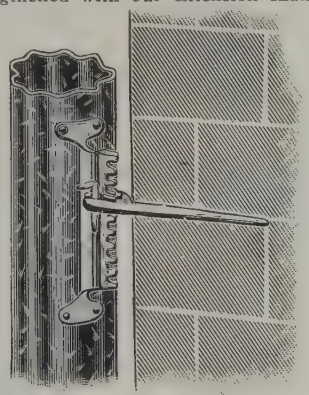
No. 16. For fastening under shingles

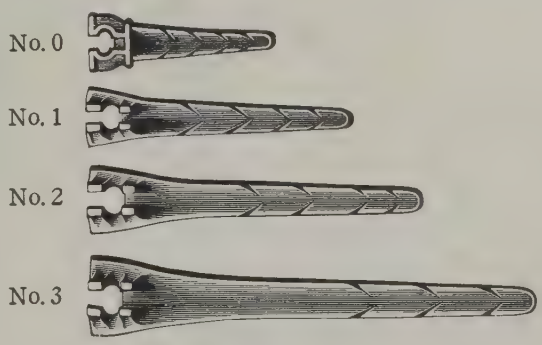


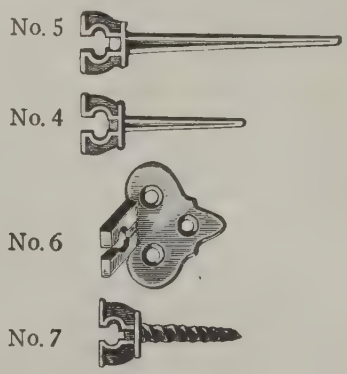
No. 20. For nailing or screwing to various shaped mouldings at any angle desired. Hinged for any pitch of roof

B. B. Gutter Hangers

Made of malleable and wrought iron, plain or tinned (plain furnished unless otherwise specified), solid cast bronze and copper channel. All shanks and circles interchangeable. One bolt included with each hinged shank. Hinged shanks are adjustable to any pitch of roof. Shanks may be lengthened with our extension shanks. Free samples on request



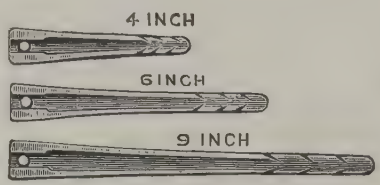


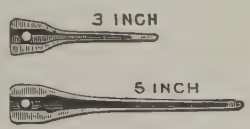


Pipe Fasteners

For fastening all kinds of conductor pipes at any distance from the wall. Used in any position and allow enough variation to let pipe slip together until tight in the joints. Needs no close measuring on wall to find a joint for the drive

No. 0. For brick, 3 in. No. 1. For brick or stone, 4½ in. No. 2. For stone, 6 in. No. 3. For stone, 9 in. No. 4. For wood, 3 in. No. 5. For wood, 5 in. No. 6. To nail on wood. No. 7. To screw in wood.



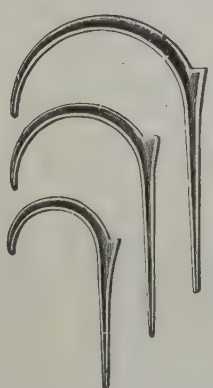


Clasp Pipe Hooks

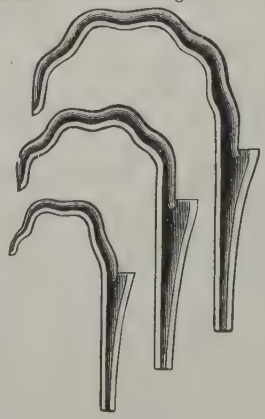
For fastening conductor pipe to wood, brick or stone at any distance from the wall. Length drives: 3 and 5 in. for wood; 4, 6 and 9 in. for brick and stone

Round Corrugated Hinged Pipe Hook
With wood and brick drive. Sizes, 2, 3, 4, 5 and 6 in.

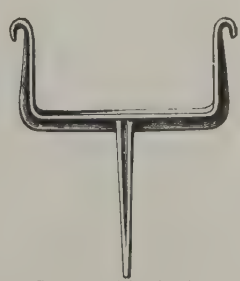
Plain Round Hinged Pipe Hook
With brick drive in 2, 3, and 4 in., and wood drive in 2, 3 and 4-in. sizes.



Plain Sickle Pipe Hooks
With wood and brick drive. Sizes, 2, 3, 4, 5 and 6 in.



Corrugated Sickle Pipe Hooks
With wood and brick drive. Sizes, 2, 3 and 4 in.



Square Wired Pipe Hook
With wood and brick drive. Sizes, 3, 4, 5 and 6 in.

Round Wired Pipe Hook
With wood drive. Sizes, 3 and 4 in.

B. B. Conductor Pipe Fasteners and Hooks

Made of tinned malleable iron and of solid cast bronze

CHASE TRADE-MARK

COPPER LEADERS, ELBOWS, SHOES, STRAPS, STRAINERS, HEADS.

COPPER GUTTERS: MITERS, END PIECES, CAPS, OUTLETS and HANGERS.

SHEET COPPER; ROOFING NAILS; COPPER SHINGLES; COPPER SPANISH TILE.

DRAWN BRASS DOOR SADDLES and SILL MOULDING.

Also, Snow Guards; Copper Ridge Caps, Rolls, Valleys and Flashings; Brass and Bronze Railings; Grilles; Ornamental Wire Work.

For Bronze and Copper Screen Cloth, see page B1561; for Alpha Brass Pipe, see page C2704.

Chase Star Brand Copper Leaders

Only 16 oz. pure copper will give the satisfactory long life and permanently trim, neat appearance that rightfully should be and is expected of copper leaders and gutters.

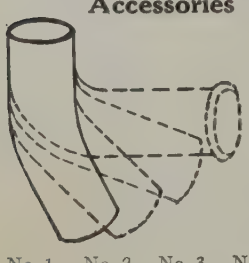
Every length of Chase leader and gutter is clearly embossed with our name and the net weight of hard rolled, roofing temper pure sheet copper from which it is made. Our name and brand mark on a length of copper leader or gutter is positive assurance of full net weight, standard quality material. All Chase copper products are unconditionally guaranteed.

In order to meet requirements of the building trades for prompt service we carry on hand in our warehouses, ready for *immediate* shipment an extensive stock of copper leaders comprising the following sizes and kinds.

Copper leader	Weight of copper, oz.	Lengths, ft.	Diameter, in.
Plain round	16	10	2, 3, 4, and 5
Corrugated round	16	10	2, 3, 4, 5 and 6
*Corrugated square	16	10	2, 3, 4, and 5

*From long custom this type of leader is termed "square," whereas it is in reality rectangular in shape. Sizes carried in our stock as noted above are standard. Actual measurement of 2-in. "square" corrugated leader is 1¾x2¼ in.; 3 in.=2⅜x3¼ in.; 4 in.=2¾x4¼ in.; 5 in.=3¾x5 in.

Chase Copper Leader and Gutter Fittings and Accessories



No. 1 45° | No. 2 60° | No. 3 75° | No. 4 90° Shoe

Types of Leader Elbows

Elbows, shoes, miters, end pieces, caps and outlets are also carried in our warehouse stock in sizes and patterns to correspond with foregoing stock items of leader and gutter.

Leader elbows are ordinarily designated by "number" and diameter. "Number" indicates degree of angle (see accompanying sketch).

Chase Copper Gutter

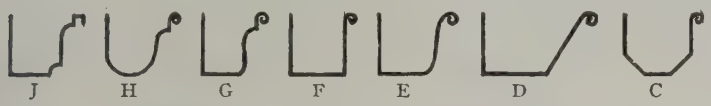
Single bead, lap joint half round. Stock sizes: 16-oz. copper, 10-ft. lengths, 4, 5, and 6-in. diam.

Double bead, half round gutter, also double or single bead, *slip* joint types can be furnished promptly to special order.

While it is possible for a skilled metal worker to make satisfactory quality copper gutter, this practice leaves the architect without positive means of knowing that full weight, 16-oz. copper has been installed on a residence, in accordance with specifications.

Like our Chase Copper Leader we advocate the use of *factory made* material and for purposes of quick identification and as our positive guarantee of full weight standard quality, every length of genuine Chase copper gutter is indelibly die stamped with our name and the full net weight of copper from which it is made.

To meet special requirements a variety of "OG" and other types of copper gutters can be made to order promptly. The following suggested patterns give some idea of our facilities in this direction.



Styles of Special Copper Gutters

End or contour views showing some types of "OG" and special patterns of copper gutters that can be made promptly to special order (not drawn to scale). These designs may be varied in any particular to conform with architects' plans and can be made in any size desired

Chase Sheet Copper

Has a reputation with the roofing and sheet metal working trades as a dependable, uniformly satisfactory product.

Every step in the production of Chase sheet copper from mine to ingot and from ingot to the rolled sheet is carried out in full accordance with present day standards and improved methods.

Chase sheet copper is as near 100% pure as any sheet copper can be made.

By writing Chase Copper into specifications you will have the satisfaction of knowing that you are providing for material with a thoroughly tried and proved reputation for quality.

Chase "Old English" Lead Coated Copper

For roofs, valleys, flashings, leaders, gutters and other outside metal trim on country houses or public buildings where "English" style of architecture is a feature.

Can be furnished in any required size. Coated on one or both sides, as desired.

The cost is only a fraction of that of hard sheet lead or cast lead fittings. It is much lighter than pure lead and therefore easier to handle and support. It will not dent and damage as easily as pure lead. It can be worked into innumerable designs and patterns that would be impossible of attainment with cast lead.

Chase Drawn Brass Door Saddles

Ready to ship from warehouse stock in two types, *plain* and *corrugated;* and in three widths, *four, five* and *six-inch* (see drawings of cross sections opposite).

Drawn brass saddles should not be confused with *cast* brass equipment, which is much softer and less durable than drawn metal for this purpose.

Iron door saddles will rust and are unsightly; marble and stone wear away quickly, also chip and crack easily; while wood is wholly unsuitable for use where there is any great amount of traffic. Drawn brass saddles are ideal for both interior and exterior use.

Furnished ready cut to specific lengths or in random mill lengths up to *twelve feet.* Notched end cuts will be made without charge provided they can be made on a circular bench saw. Any odd width up to *six inches* can be furnished from mill where quantity required is sufficient to warrant special manufacture.

Chase Drawn Brass Weatherproof Sill Moulding

Every wood frame casement window and outside French door should have a strip of non-rustable weatherproof moulding installed on the sill.

We specialize in brass moulding for this purpose and have tools for the manufacture of a variety of types, three of which are illustrated here.

Combination brass door saddles and weatherproof sill mouldings are in great favor for suburban residences and we can furnish practically any type or size to special order provided the quantities required are large enough to warrant special manufacture.

Samples and further details regarding standard types and sizes gladly furnished upon request.

LOUIS ABT & COMPANY

Manufacturers of the Abt Double Ventilating Skylight

2651-2653 Roosevelt Road
CHICAGO, ILL.

Product

The Abt Double Ventilating Skylight, Manually Chain Operated, or Electric Power with or without Automatic Thermostatic Control.

Adaptation

An essential in the design of garages, foundries, factories, laundries, etc., in the elimination of smoke, steam and gases in conjunction with natural controlled air change necessary for efficient working conditions.

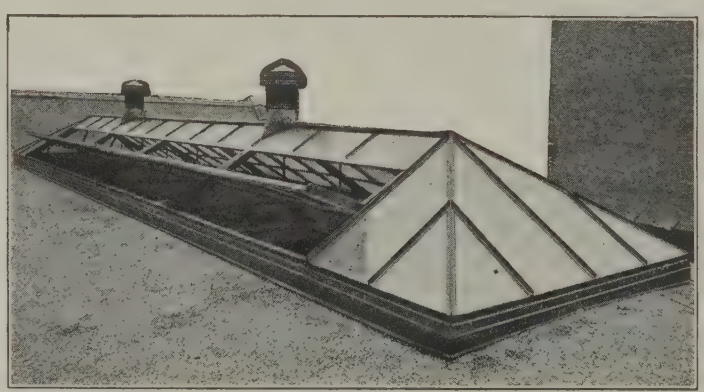
Description

The Abt Double Ventilating Skylights provide both *intake* and *exhaust* opening for complete, *controlled* natural ventilation readily adapted to specific industrial and building requirements. An analysis of the patented construction discloses the highest type of efficiency value possible—capable of practically twice the ventilation or open area provided by other skylights of the same size.

Structurally the design assures the utmost in permanent strength and rigidity without excessive weight. Due to the design of the axle balanced ventilating sash, continuous runs of 100 ft. or more are operated with the least possible effort. The construction of the weathering members at the operating units is watertight under all conditions.

Designs and Sizes

The construction is adapted to any design such as gable end, hip, gambrel roof or sawtooth. Made in standard widths 6, 8, 10, 12 and 14 ft. and from 8 ft. to any required length. Special widths at additional cost.



Model "B"
Also made in gable type

Types

Model B—Has a glass ridge. Made with either gable end (where the ventilating sash may run the full length if desired) or hipped (where the ventilating sash may run the length of the ridge).

Model C—Has a metal ridge with gable end. The ventilating sash sections alternate with fixed skylight sections.

Model D—Gable end gambrel roof type with the ridge slope glazed. Made with alternate panels of ventilating sash and fixed glass or with ventilating sash running the full length.

Operators

Manual Operation—Chain operated wheel or rod operated gear direct connected to a pipe shaft operating racks and pinions. Continuous runs of 100 ft. or more of ventilating sash are operated from a single power unit with the greatest ease and speed—runs are completely opened or closed in less than a minute.

Electric Power—Motor driven through friction drive direct connected to pipe shaft operating racks and pinions with minimum current consumption. Completely equipped with special remote control panel—ventilating sash may be started and stopped at will from any position. Opposite sides of skylight may be operated simultaneously or independently. Automatically stops at full open and full closed without strain on operating device.

Automatic Thermostatic Control—Applied in conjunction with electric power. Is entirely automatic but can be controlled to suit conditions from remote control panel as above described. Arranged to operate one or both sides of skylight and to stop and start at will.

AMERICAN SKYLIGHT COMPANY

American Ventilating Skylights and "Steelead" Skylights

2617-2625 Fletcher Street

CHICAGO, ILL.

BRANCH OFFICES IN ALL PRINCIPAL CITIES

West of the Rocky Mountains, "Steelead" Skylights are Manufactured and Installed by NORTHWEST LEAD COMPANY, SEATTLE, WASH.

AMERICAN VENTILATING SKYLIGHTS

Type "F" American Ridge Ventilating Skylights

This advanced construction meets every demand of the architect. It gives a full measure of daylight and provides perfectly controlled ventilation as well.

Because of this double value, these skylights are ideal installations for public garages, laundries, shops, foundries, gymnasiums, schools, public auditoriums, etc.

Type "F" ventilating skylights have movable or ventilating sash at the ridge with fixed sections below. Either or both sides of the ventilating units may be opened. The ventilating units are built from 4 to 28 ft. in length and 30 in. wide. The width of the ventilating unit is fixed and does not vary with the width of the skylight. Only one operator is required for every 28 ft. of type "F" ventilation.

The operator may be equipped with detachable pole with crank handle or an endless chain, as preferred, or it can be fitted with electric drive if desired, so that by simply pressing an ordinary light switch in the wall, the skylight will open. A ¼ hp. motor will easily operate one ventilating section.

Type "F" skylights are glazed with ¼-in. wire glass, ribbed or rough and are made of No. 18 galvanized copper bearing metal. They are carried in stock in standard sizes 4, 6, 8, 10 and 12 ft. wide, these dimensions being out to out of curbs, length as desired. They can be made up to practically any width and many installations have been made of skylights as wide as 30 ft. Type "F" skylights can also be made of copper, aluminum, or leadclad metal, at slight additional cost.

Competent erection crews maintained in the larger cities insure prompt service and careful supervision of installations anywhere in the United States.

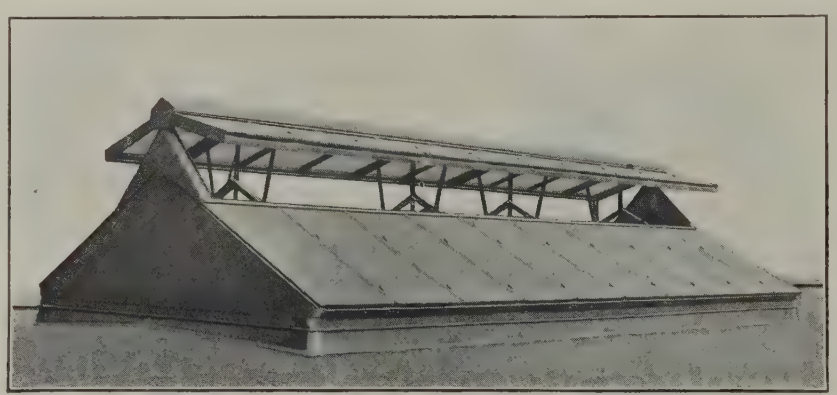
Type "F" skylights are shipped to the job partially assembled so that very little additional labor will complete the erection. All units are bolted together; no soldering is necessary and complete erection instructions and layout drawings are provided when the skylights are to be erected by local sheet metal men or contractors.

The detail below clearly illustrates the method of operation. The steel trusses are always provided as part of the skylight. The design of the truss varies with the width of the skylight; they are always spaced not greater than 6 ft. on centers. A curb flashing is provided which extends down 4 in. below top of curb.

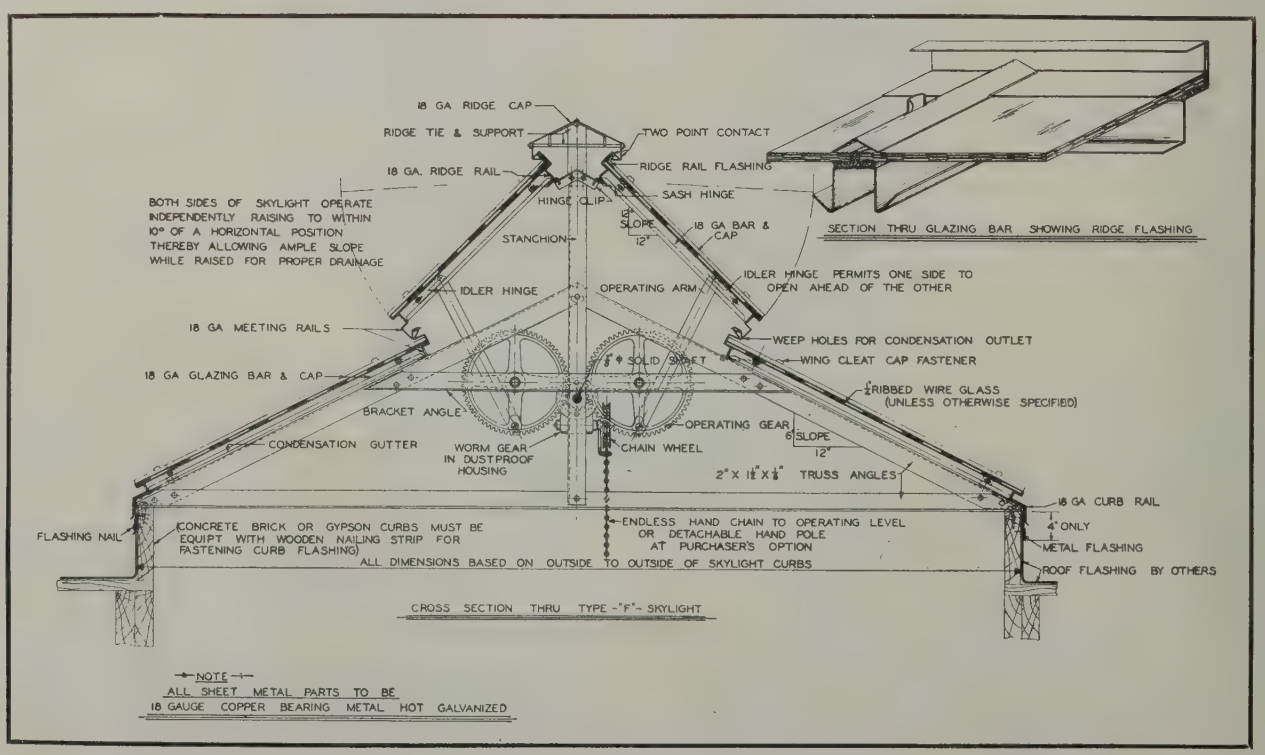
Specifications—Skylights shown on plans shall be Type "F" Ridge Ventilating, as made by the AMERICAN SKYLIGHT COMPANY, Chicago, Illinois. They shall be composed of stationary and hinged sections, the length of hinged sections to be as indicated on plans.

All sheet metal parts to be formed of No. 18 gauge galvanized copper bearing rust resisting metal, pressed into shape and fitted together without the use of solder. The sash shall be supported on steel trusses not more than 6 ft. on centers. The skylights shall be glazed with ¼-in. ribbed or rough wire glass, set in putty. The skylights shall be operated by means of a detachable pole with crank handle [endless chain].

All metal parts shall have one shop coat of special prepared paint.



Type "F" Skylight, Showing Ventilating Features



Details of Type "F" Skylight Showing All Important Features of Construction

Continued on next page

Type "J" Skylight

Fills the need for maximum ventilation without sacrificing daylight. Provides great exhaust capacity with perfect control and maximum light area.

Complete sash can be raised from ridge to curb. Either or both sides may be raised at will. By opening side away from the wind, air will be drawn out of building; opening side towards the wind will force fresh air into building. Both sides open will ventilate building. If both sides are closed it is absolutely weathertight.

Standard width sizes are carried in stock at all times so that prompt shipments can be made. Skylights 4, 6, 8, 10 and 12 ft. wide are standard, these dimensions being out to out of curbs.

Type J Construction—*Sash*—The sash is made of 18 gauge galvanized copper bearing, rust resisting metal. Glazing bar is shaped to provide deep condensation gutters. Upper and lower rails make weathertight connections. Sash is hinged at the top and may be raised to a position 10 degrees below horizontal, allowing ample slope for drainage.

Trusses—Trusses are spaced not greater than 6 ft. apart. They are made of 2x1½x⅛-in. steel angles with riveted connections. Center member of truss supports ridge.

Ridge—Ridge is constructed of 18 gauge galvanized copper bearing, rust resisting metal. Extends the full length of skylight, overlapping gable ends. Ridge is securely bolted to the center member of each truss.

The Gable Ends—Gable ends are made of 18 gauge galvanized copper bearing, rust resisting metal. They are well reinforced by steel angles.

Curb Flashing—Flashing extends 4 in. below top of curb. It is made of 24 gauge galvanized copper bearing, rust resisting metal.

Manual Operators—Operators are controlled by a pole with crank handle or an endless chain as preferred. Where impractical to operate skylight from a point directly beneath, simple connections can be supplied at slight additional cost for remote control.

Motor Operators—Motor driven units can be used equipped with limit switches.

Glass—¼-in ribbed or rough wire glass supplied with all orders. Best grade linseed oil putty is furnished. After glass is set, flashing caps are secured to glazing bars to protect putty.

Paint—All metal parts are given one coat of special prepared paint at the factory.

Specifications—*Full Vent Type "J"*—Skylights shown on plans shall be of the type known as Full Ventilating, as made by the American Skylight Company. They shall be composed of sections on each side that are hinged at the ridge and raised from the curb. These shall be operated by a hand chain mechanism or detachable pole with crank handle from below; each side separately. They shall be made of No. 18 gauge galvanized copper bearing metal painted on shop coat of special prepared paint. Glazing shall be ¼-in. (ribbed or rough) wired glass.

Details of Type "J" Skylight Showing All Important Features of Construction

Continued on next page

"STEELEAD" SKYLIGHTS

West of the Rocky Mountains these skylights are manufactured and installed by Northwest Lead Company, *Seattle, Washington*

"Steelead" Skylight Features

Put through every possible trial by engineers and architects—tested by time in hundreds of installations—"Steelead" has proven itself to be above all the perfect skylight. It is adapted to all types of construction, in all kinds of locations.

"Steelead" Skylights can be built in any style—lean-to, single pitch, hip, gable, or sawtooth. Any style ventilator can be installed with "Steelead" as well or better than with most sheet metal constructions. Whatever the type of installation, there is a "Steelead" construction to meet it.

Strength—The 1½-in. steel T-bar core in the standard "Steelead" bar is sufficient structurally for a 7-ft. clear span. This permits the construction of double pitch skylights up to 12 ft. in span (out to out of curbs) without the use of purlins.

A heavier "Steelead" bar is carried in stock with a steel T-bar core 2x2x¼ in.—3.56 lb. The 2-in. "Steelead" bar is sufficient structurally for a 9-ft. clear span. This permits the construction of double pitch skylights up to 16 ft. out to out of curbs, without the use of purlins using the 2-in. "Steelead" bar.

Permanence—The lead sheath is everlasting. Will not rust, rot or corrode. Needs no paint, packing, or putty.

For railroad use in depots, train sheds, freight houses, with their great assault of smoke, gases and vibration; for factories with the attacks of fumes, steam and vibration; for institutions where upkeep is an item and permanence a need; for public buildings where dependability is paramount—"Steelead" has proven itself without an equal. And its cost is no greater than copper sheet metal constructions.

"Steelead" Bar—The patented "Steelead" bar is the basis of the "Steelead" skylight, and the secret of its superiority. This combines the strength of steel with the permanence of lead.

On a standard 1½x1½x$\frac{3}{16}$-in. steel T-bar is moulded a seamless sheath of pure lead, our special patented design for skylight construction. After being cut to the proper length, both ends of the bar are sealed with lead.

An ideal glass rest is provided by forming a heavy ridge at the heel of the bar. The glass actually rests on a thin knife edge of lead, formed on top of the ridge. Due to the thin edge and the ductility of lead, this knife edge under the weight of the glass, conforms to any unevenness in the glass, prevents undue strain at any point and makes an absolutely tight joint.

There is also formed between the glass rest and the stem of the bar a drip gutter that catches any possible leakage.

Condensation gutters are provided and are opened with a wood tool just before the glass is set.

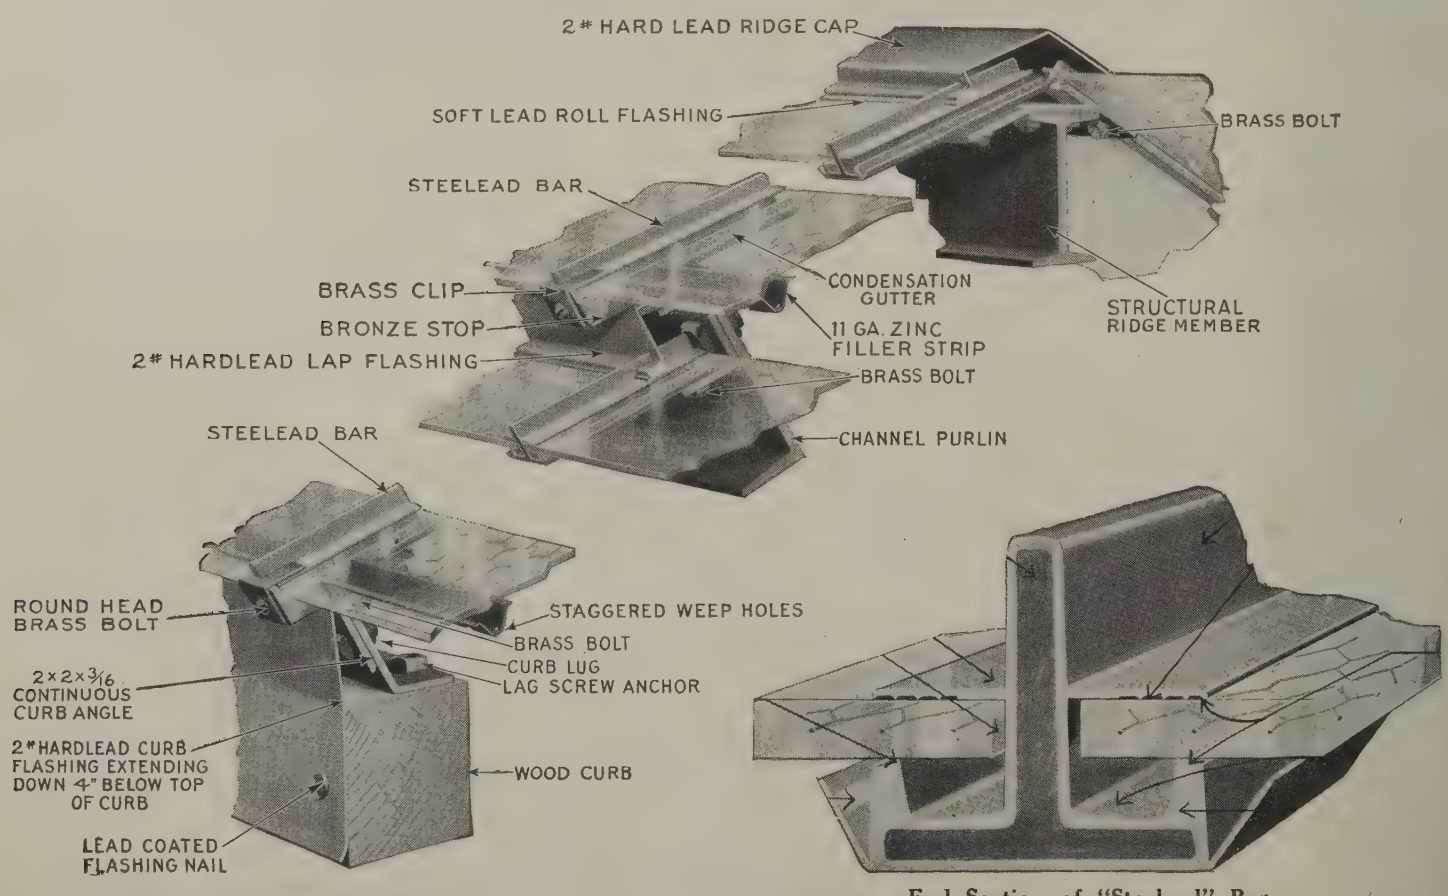
On the web of the "Steelead" bar are moulded, integral with the lead sheath, lead glazing wings. After the glass is placed on the lead seat, the glazing wing is pressed down on top of the glass. The undersides of these glazing wings are longitudinally ribbed so that when pressed onto the glass they conform to the unevenness and make a series of air seals that are dusttight, watertight and windtight. These wings will withstand severe air pressure from below, yet they can easily be raised to replace a broken glass.

Thus the glass rests on lead and is held in place by lead without using putty or packing. It is tight, yet free to expand and contract—an ideal condition for skylight glass.

"Steelead" Design—Where the skylights are not considered as part of the structural design of the building, necessary structural trusses for the skylights are designed and constructed at our factory. Where the skylight supports are considered as part of the structural steel supporting the building, "Steelead" can readily be adapted to meet these conditions.

Where two or more runs of glass are required along the slope of a skylight the upper run is lapped over the lower run, a method much better than the butt joint construction for the reason that any condensation is carried out at the lower end of each run and does not need to travel underneath the skylight until it reaches the curb. Some sheet metal authorities advise against using sheet metal puttyless constructions with hipped skylights, because of difficulty in making a weathertight job. We have experienced no difficulty in producing a perfectly weathertight, hipped "Steelead" Skylight; in fact, the majority of our installations have been of this construction.

In a "Steelead" Skylight only glass and lead are exposed to the elements, with the exception of a cast bronze bar stop, which holds the lower end of each "Steelead" bar. Therefore, "Steelead" Skylights should last as long as the building.



End Section of "Steelead" Bar

Continued on next page

Specifications

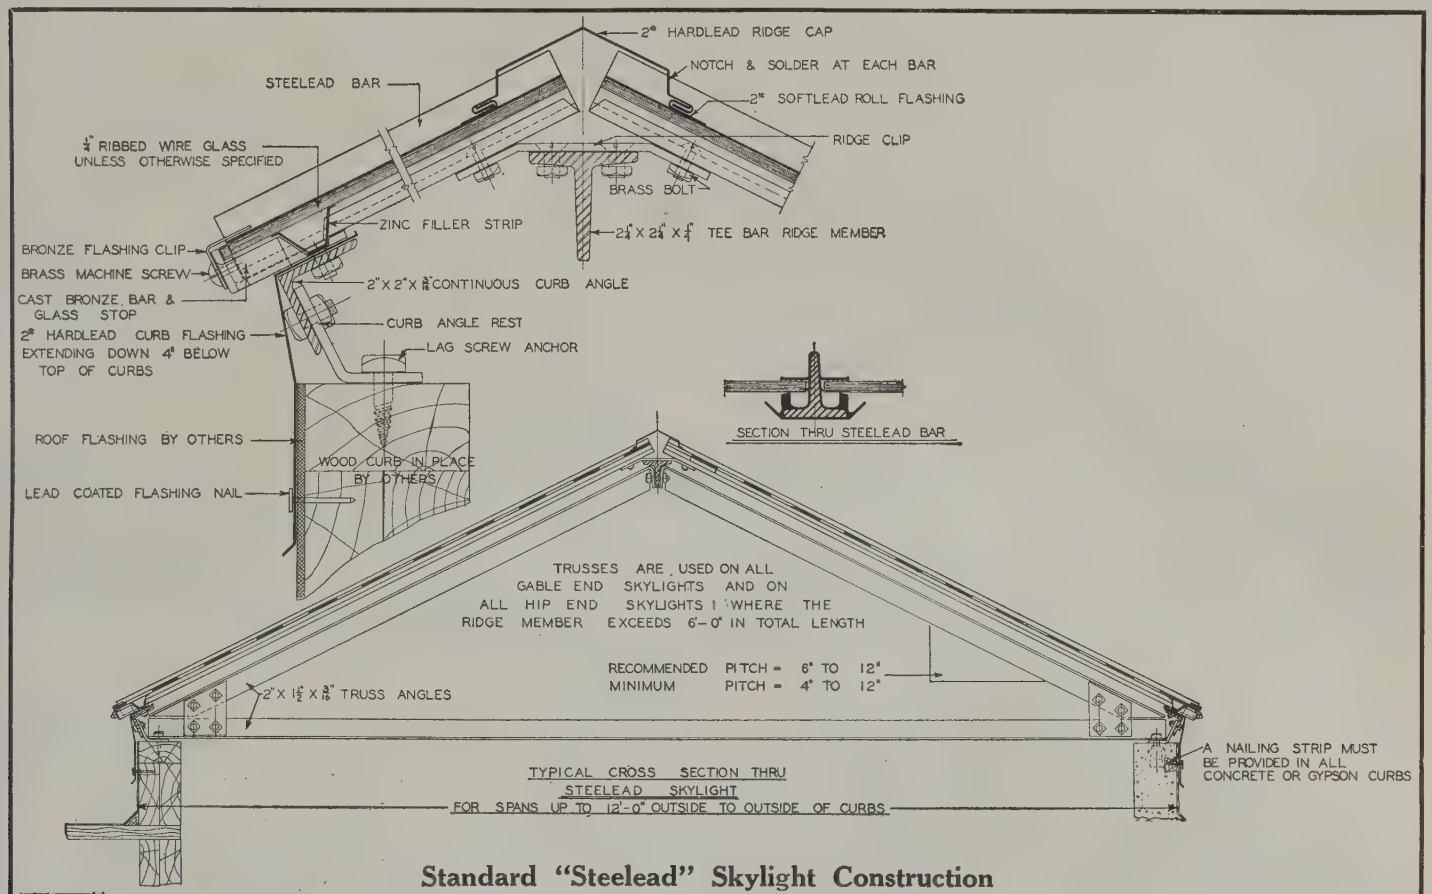
All skylights shown on the plans shall be constructed of "Steelead," as manufactured by the American Skylight Company, and in accordance with detailed drawings submitted by them and approved by the architects, engineers, or purchasers.

Glass supporting Steelead bars shall have a maximum deflection of not more than 1/30 in. per lineal foot of span, under normal loadings. The steel bar shall be hermetically sealed in a seamless lead sheath, fully capable of resisting attacks by fumes, gases, etc.

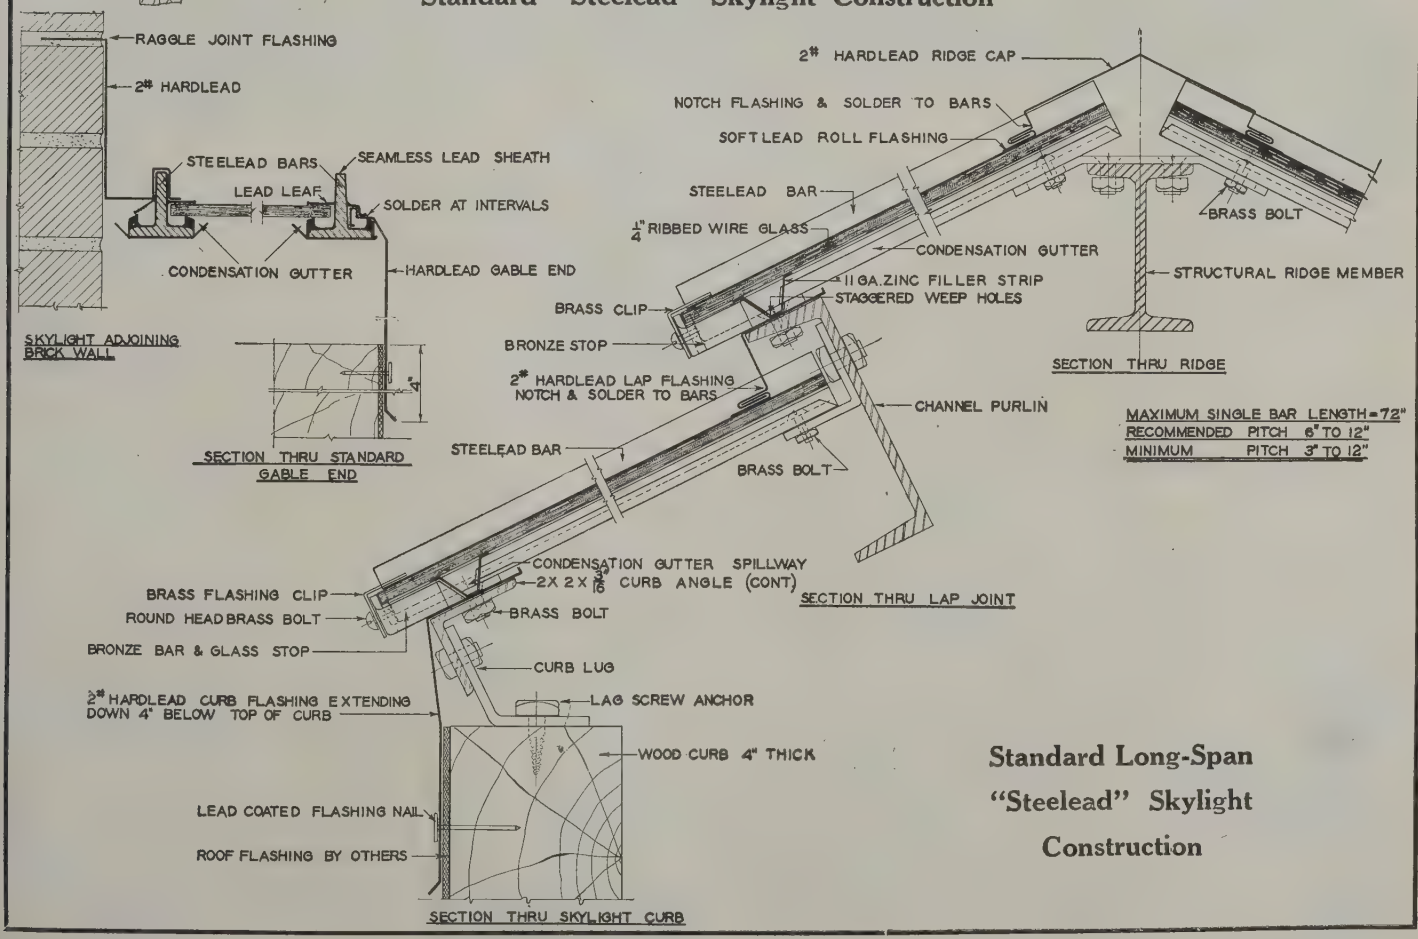
The glass shall be (state thickness, make and kind). This glass shall have a bearing on a lead cushion, and be left free to expand, without coming into contact with bolts or other rigid substances. The glass shall be held securely in place by the lead wings on the bar, making a weathertight joint without the use of putty or packing. Ample provision shall be made for carrying away all condensation which may be delivered from the underside of the glass.

Skylight work shall be free of leaks and glass shall be left clean and without cracks.

All flashings pertaining to the skylights shall be hard lead weighing not less than 2 lb. per sq. ft.



Standard "Steelead" Skylight Construction



Standard Long-Span "Steelead" Skylight Construction

BLASKI MANUFACTURING CO.

Exclusive Skylight Manufacturers

4132-4138 Belmont Avenue, CHICAGO, ILL.

BRANCHES IN PRINCIPAL CITIES

Products

BLASKI LEAKPROOF *Puttyless* VENTILATING SKYLIGHTS.
BLASKI LEAKPROOF *Putty* VENTILATING SKYLIGHTS.

Special Features

Blaski skylights are entirely self-supported by steel trusses, and do not require any special preparatory construction except the curbs. They are built completely of *No. 18 gauge* galvanized *copper bearing* iron, machine fabricated throughout. All parts are bolted, riveted, or interlocked. An absolutely *solderless* construction which will last a lifetime.

The quality of the die and machine made parts is of a uniform high standard; every piece being an exact duplicate of the original part which was designed and made by experts.

Blaski detachable rod operators eliminate the hanging chain nuisance. All steel (patented self-locking spur gear for highest possible efficiency) mechanisms running in bronze bushings throughout. Will open or close the sash with less than one-third the effort and time required to manipulate other devices.

In the *puttyless* type a perfect puttyless glazing system provides for quick and easy removal of all glass for cleaning and painting of the skylights. This feature saves considerable time and money and insures a better job of painting.

Types

Both the *puttyless* and *putty* constructions are made in three standard types, "B," "C," and "D" as illustrated on page A571.

Standard widths for type "B" are 4 ft., 6 ft., 8 ft., 10 ft., and 12 ft.

Standard widths for type "C" are 13 ft. 4 in., 15 ft. 4 in., 17 ft. 4 in., and 19 ft. 4 in.

Standard heights for type "D" are 4 ft. 4 in., 5 ft. 6 in., 6 ft. 8 in.

These standard widths and heights are carried in stock in any lengths, ready for erection.

Really Good Skylights

Types "B," "C" and "D" skylights, we believe are the outstanding examples of really good skylight construction. Every detail incorporated in these skylights is the result of long study and experimentation by experts and then proven under all conditions by years of actual service. The rugged construction, neat proportioning of all parts and the really fine workmanship, all tend to inspire confidence in their performance.

Blaski Skylights for All Uses

Types "B" and "C" skylights, in their variety of sizes and possible lengths of ventilating sections, can be placed at strategic points so as to light and ventilate the entire building chiefly through the roof. The increased efficiency and saving of electric light soon pays for the installation. The general trend when Blaski skylights have been tried is increased use, and many architects literally flood the building with Blaski skylights and ventilation. We also receive a large number of orders direct from owners who add to the quantity of Blaski skylights originally installed to cover additional requirements.

Blaski Puttyless Ventilating Skylight

Same construction also furnished with conventional pully glazing (putty type)

Quick Delivery

An average of over 100,000 sq. ft. of skylights are stocked for immediate shipment. The actual installation requires only a few simple assembling operations, which any handy man can quickly accomplish with only ordinary tools. This advantage is particularly desirable when skylights are ordered to be erected by mechanics already on the job.

Installation Crews and Factory Branches

Our erection crews are thoroughly experienced, and are available for service in any part of the country.

Factory branches located in principal cities. These branches carry complete stocks and replicas of our factory service equipment, and thus can provide service equal that of the parent organization. Your inquiry will be referred at once to the nearest branch.

Prices, Inquiries, etc.

Requests for quotations should designate whether *puttyless* or *putty* type is wanted, as there is a difference in cost. State number of skylights, their sizes and length of each skylight to be ventilated.

DETAILS OF TYPE "C"

Ventilating or stationary skylight construction. Upper and lower sections of skylight can be arranged to ventilate. Operating mechanism same as used on type "B" skylights. Stocked for curb widths 12-0, 14-0, 16-0, 18-0 and 20-0 wide and any length.

Continued on next page

Construction Details

Fabrication—Complete fabrication of all parts direct from raw materials is done in plants owned by the Blaski Manufacturing Co., under the strictest supervision and inspection. This, we believe, is the strongest guarantee of quality in any specification.

Supporting Structure—All steel trusses built from angles from 2x1½x⅛ in. to 2½x2x¼ in. depending on size of skylight, but never spaced more than 67 in. apart.

Glass Bearing Members and Closures—These parts are all die and machine fabricated from 18 gauge galvanized copper-bearing iron. The galvanized coating is not injured, as is very likely with handwork. Assembly of the various parts is by bolting, lug and slot interlocking, or riveting, but never soldering. Thus each joint is of a predetermined strength.

Glass and Puttyless Glazing—The ¼-in. thick ribbed wire glass set in Blaski moulded glazing cushions is perfectly protected against expansion, contraction and flexure of skylight or glass. The cushions take up all twist and shock—as we frequently demonstrate by lifting one corner of an open sash without breakage of glass.

Putty Glazing—In the *Putty* type, we employ the conventional method of glazing, using a high grade glazing cement.

Operating Mechanism—All-steel rack and pinion type with all setscrews of permanent self-seating type. Shafting journaled in brass bushings which prevent rusting in. Operation by light detachable handle with friction clutch that positively prevents accidental or willful injury to operating mechanism. This operating mechanism requires only one-third the manual power as compared to the cast iron worm gear type, and does away with the ordinary troublesome chain nuisance.

Hardware and Miscellaneous—Like the operating mechanism, all hardware is pressed steel and designed especially for the purpose required. A flexible 24 gauge galvanized iron weatherstrip is used between the curb and lower rails. This is the only place where metal lighter than 18 gauge is used.

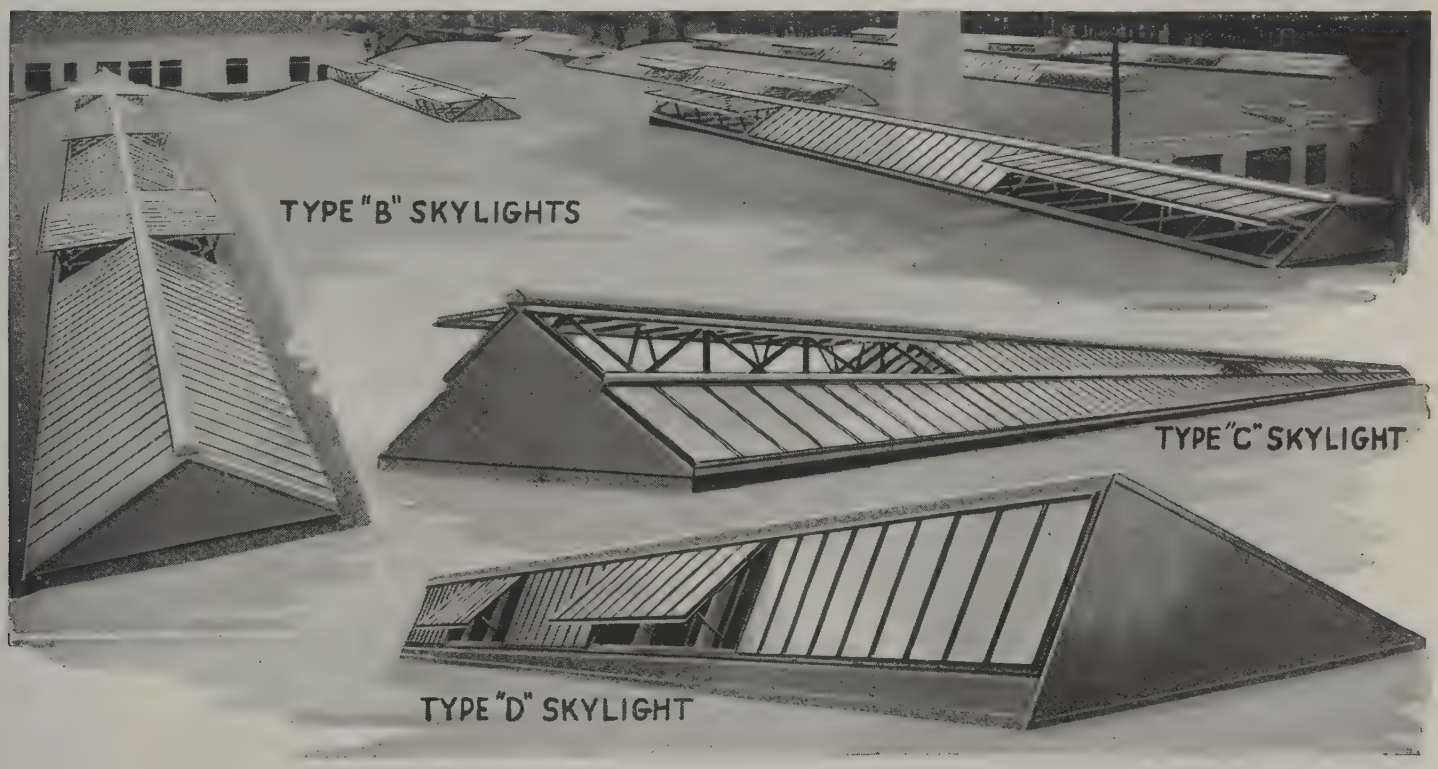
Painting—Trusses receive a shop coat of red mineral paint before assembly. Operators and mechanism receive one shop coat of black paint. Galvanized iron parts are not painted unless painting is specified.

Flashings—Our composition flashing 9 in. wide is regularly furnished with all skylights. Other kinds of flashing can be installed on special order or can be included in the specifications of other contractors.

Special Metals—For general use the metals specified above will prove satisfactory, as the careful fabrication and high quality of metals give the skylight an expected life of from 50 to 75 years. For abnormal conditions skylights of a variety of metals can be made to stand up under any kind of requirements.

Recommended Architects' Specifications

Skylights to be of the (state whether *Puttyless* or *Putty*) ventilating type as manufactured by the Blaski Manufacturing Co., 4132-4138 Belmont Avenue, Chicago, Ill. The size of skylights and lengths of ventilating sections to be in accordance with sizes shown in plans.



General Information

Curbs and Flashings—Curbs for Type "B" skylights should be 4, 6, 8, 10, or 12 ft. wide and any length. For Type "C" the curbs should be 13 ft. 4 in., 15 ft. 4 in., 17 ft. 4 in., or 19 ft. 4 in. wide and any length. Measurements in both cases are outside measure. Measures for opening in sawtooth framing are from head to sill and inside between ends. Variation of ¼ in. over or under is the maximum allowance for all skylight curbs or openings. A typical wood and concrete curb is shown in section on detail of Type "B" skylight, and typical sawtooth framing on detail of Type "D" skylight. Any other style of curb can be built, however, as the only requisites for Blaski skylights are continuous fastening grounds or wood plate on the top of the curb, and continuous nailing strip about 6 in. above the roof line for fastening of roofing and flashing. Type "D" skylight framing can also be of any style with provisions for fastening of skylight and flashings. The details on the two preceding pages are drawn to a 3-in. scale. Necessary dimensions can be scaled directly from them.

The height of curbs or sills above the roof line depends on circumstances. A high curb must be metal flashed. Low curbs, such as possible on rounded truss roof construction, can be finished with our composition flashing as shown by typical curb sections on detail of Type "B." This type of flashing has been used by us very successfully for over six years and effects considerable economies both in first cost and later re-roofing. The joint being roofing to a similar material is very tight and is much better than joints made to brick walls. The joint is also protected by the large overhang of the galvanized weatherstrip.

Skylight Sizes and Lighting Efficiency—A general statement can be made, that about 15% to 25% of the floor area should be the area of skylights, and this percentage can vary with the nature of the work performed in the building. Large skylights in preference to smaller sizes are recommended. As an example: a room 40x80 ft. 20% lighted requires a 10x64 ft. skylight. The same amount of money spent for, say four smaller skylights, would probably buy only 10% to 15% of the floor area in skylights on account of the greater cost of small skylights, extra curb framing, etc.

Length of Ventilating Sections—The maximum length of ventilating sections for 4, 6, 8, 10, and 12-ft. wide skylights are 40, 35, 30, 25, and 20 ft., respectively; for 13 ft. 4 in., 15 ft. 4 in., 17. ft. 4 in., and 19 ft. 4 in. are 40, 35, 30, and 25 ft., respectively.

Any combination of ventilating and stationary sections is possible, but all skylights are recommended to be full ventilating, especially when the length of skylight is less than the possible length of ventilating section.

Products

"ANTI-PLUVIUS" PUTTYLESS SKYLIGHT, trade-marked and patented.

"ANTI-PLUVIUS" (NON-CORROSIVE) PUTTYLESS SKYLIGHT, trade-marked and patented.

"DROU-VE-LITE" GLASS STRUCTURE, patented.

"DROU-VE-LITE" (NON-CORROSIVE) GLASS STRUCTURE, patented.

"STRAIGHT-PUSH" SASH OPERATOR, tension type.

"DROUVÉ LOVELL" SASH OPERATOR, tension type.

WORM and GEAR SASH OPERATOR, torsion type.

Also manufacturers of "Drou-Ve-Lite" Sawtooth Continuous Ventilating Skylight and the "Drouvé" Double Gutter Ventilators.

A MODERN SKYLIGHT SERVICE FOR EVERY NEED

Manufacturing and Shipping Facilities—Our plant is a modern one-story factory building containing 40,000 sq. ft. of floor space completely equipped with the most modern sheet metal working machinery known to the trade.

This entire plant, one of the largest of its kind in the country, is devoted exclusively to the manufacture of "Anti-Pluvius" Puttyless Skylights, Drou-Ve-Lite Glass Structures, Drou-Ve-Lite Sawtooth Continuous Ventilating Skylights and various types of sash operating devices.

With a siding of the New York, New Haven and Hartford Railroad at our plant we are enabled to make prompt shipments to any part of the country.

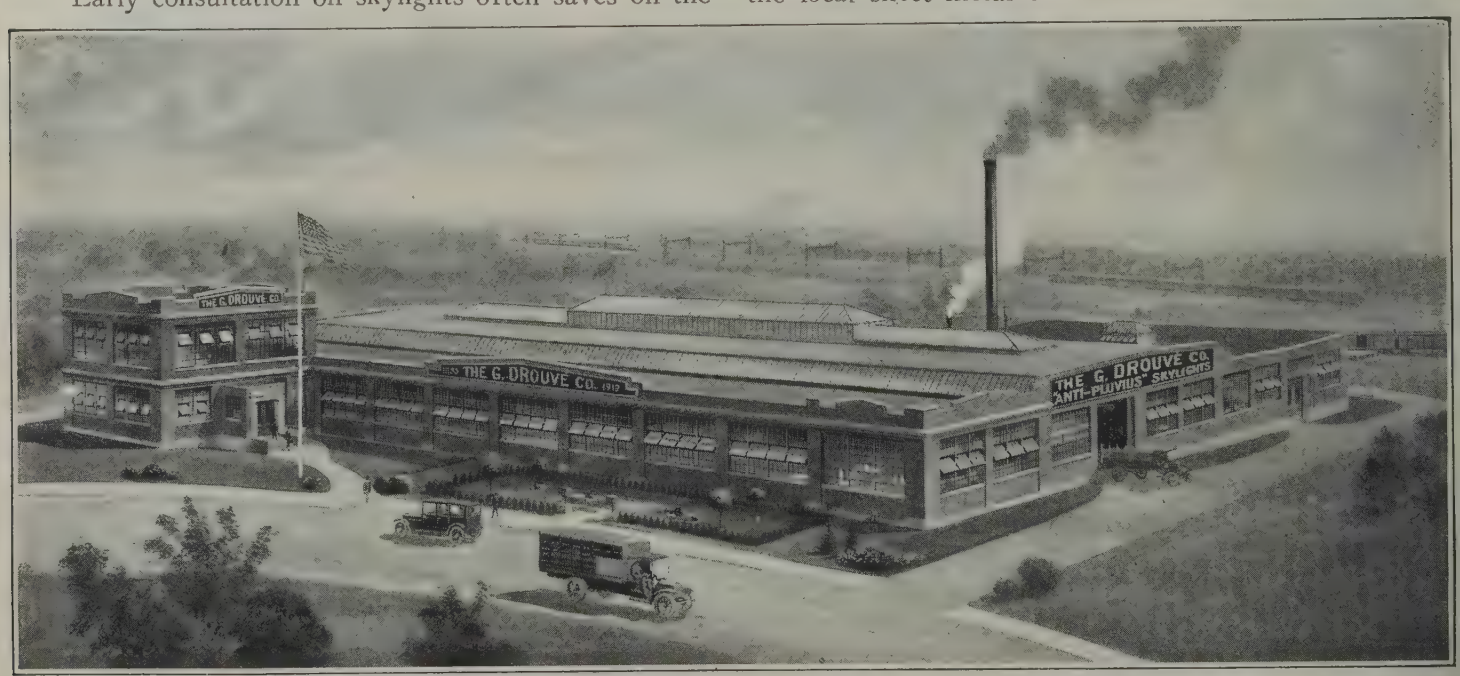
Planning and Consulting Service—An experience of over 40 years in solving skylight problems enables us to offer you practical solutions for your most intricate problems of skylight construction. Our engineering staff is ready to co-operate with you by means of a personal call or by preparing suggestions for use with the architectural drawings, without obligation to you.

Early consultation on skylights often saves on the cost of the building. Frequently it is possible to save considerably by the omission of part of the steel framing of a roof with the use of the Drou-Ve-Lite structural type of skylight which is designed especially for long spans and does not require structural reinforcing. At other times, for ordinary conditions, the "Anti-Pluvius" offers a better solution. Sometimes both are used on the same job depending on conditions. For these reasons we are always glad to go over the work under consideration and offer advice as to the type best suited to the work, without charge or obligation on the part of the architect.

Erecting Service—No matter how good a skylight is, if it is not carefully and properly put together there is always the chance that it will leak. This makes the owner dissatisfied with the work of the architect, the builder and the skylight manufacturer.

In order to insure proper and careful erection we maintain a force thoroughly skilled in erecting our skylights. They can be sent to any part of the country as required from our main office or nearest representative.

If required we will ship skylights for erection by the local sheet metal contractor.



Forty Thousand Square Feet of Floor Space Devoted Exclusively to the Manufacture of:

The "Anti-Pluvius" Puttyless Skylight. The "Drou-Ve-Lite" Glass Structure. The "Drou-Ve-Lite" Continuous Ventilating Skylight. The Drouvé "Improved Lovell" Sash Operators. The Drouvé "Straight Push" Sash Operators. The Drouvé Worm and Gear Sash Operators

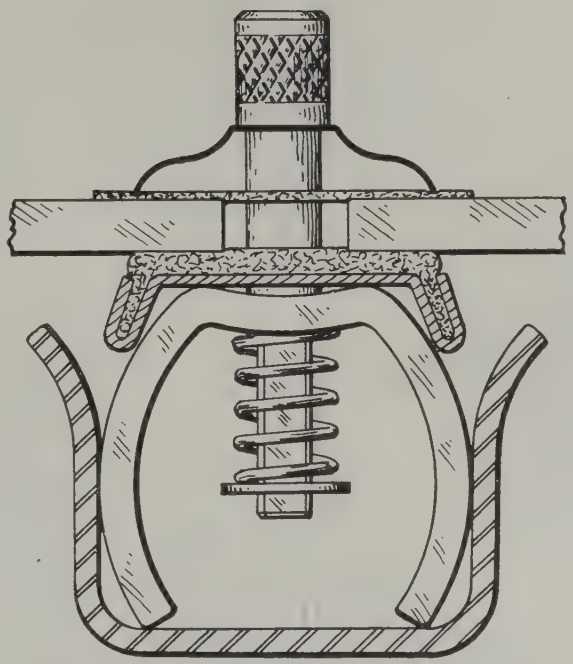
"ANTI-PLUVIUS" PUTTYLESS SKYLIGHTS FOR ORDINARY SPANS

For Long Span or Structural Skylights, see third page following

A Perfect Puttyless Skylight

"Anti-Pluvius" is one of the original puttyless skylights. Years of practical experience with skylights under all kinds of atmospheric conditions has enabled us to produce a puttyless construction which will give satisfactory service anywhere.

Sweating Eliminated—The sweating of the main supporting bars, which is so prevalent, naturally, in skylights has been very successfully eliminated by the simple method of isolating the glass and its bearing from the main supporting bars and permitting free circulation of air between the main supporting bars and the glass. Thus there is not condensation to drip into the room and cause corrosion of the bars.



Full Size Section Showing "Anti-Pluvius" Construction

Supporting Bars and Condensation Cutters Combined—By reason of the fact that the main supporting bars in our "Anti-Pluvius" skylight are U-shaped channels, they are utilized as condensation gutters as well as to give ample support for the skylight structure. This gives an exceptionally large condensation gutter due to the depth of these channels without cutting down excessively on the glass area which, in skylights, is always desired in the maximum. The over-all width of the channels at their widest point is only 2¼ in.

Breakage of Glass Is Reduced—By phosphor bronze tension springs which allow for expansion, contraction and vibration.

Other Special Features—

(1) Safety walk-bridges where the span exceeds 6 ft. from ridge to eaves when specified.

(2) Overhang construction at curbs permitting the successful discharge of condensation outside the building.

(3) Unusually high grade materials (see specifications, page A574) well balanced and perfectly fitted in their respective places in the structure.

Advantages of "Anti-Pluvius" Puttyless Skylights

"Anti-Pluvius" skylights of both regular and non-corrosive constructions possess the following advantages:

(1) Strength to satisfy the most exacting requirements (see material specifications on Plate No. .....).

(2) Positive watertightness.

(3) No sweating of main supporting bars.

(4) Every light of glass independent of every other light. The lights do not come in contact with each other nor do they come in contact with any metal.

(5) Glass rests on pure non-rotting cattle hair felt.

(6) Glass breakage reduced to a minimum.

(7) Frames are flexible and ample allowances are made for expansion and contraction, vibration and wind pressures.

(8) Adaptable to all types of roof construction.

"Anti-Pluvius" (Non-corrosive) Puttyless Skylights

This skylight in design and construction is identical with our "Anti-Pluvius," the difference being only in the metals used. These are of non-corrosive materials (not a protective process). This construction is guaranteed absolutely against any form of deterioration for an indefinite length of time. The cost of this construction is surprisingly low considering the fact that it is a skylight entirely free from any maintenance expense. This construction is ideal for use on powerhouses, chemical plants, railroad shops, foundries, etc., as it will stand up under the conditions existing in such buildings.

Sash Operators

If the design of the skylight is such that operators are required we will also furnish the proper type to suit the conditions. We make three types of operators: "Straight Push," "Improved Lovell Dreadnought" and Worm and Gear. All are of extra heavy construction designed to stand up under hard usage and unexpected conditions.

"DROU-VE-LITE" PUTTYLESS GLASS STRUCTURES FOR LONG SPAN CONSTRUCTION

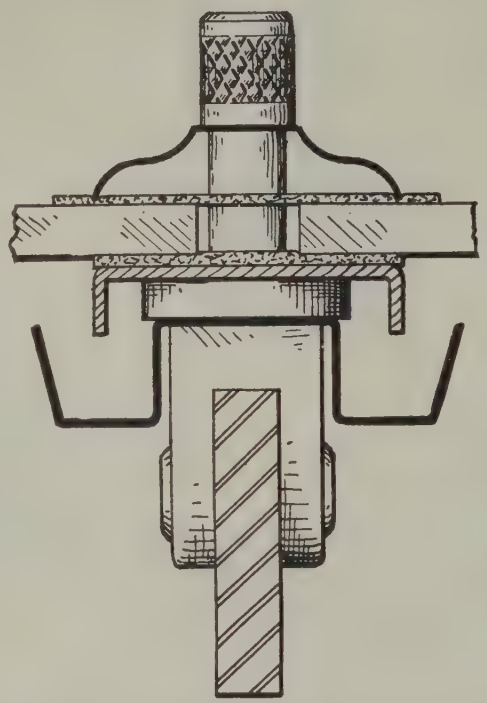
Self-supporting Puttyless Skylight Construction

In late years there has been a tendency to eliminate, as much as possible, structural steel work for the support of the skylight itself. A skylight which is self-supporting, regardless of length of span, effects a considerable saving when exceptionally wide skylights are desired, because it requires no steel work for its support other than that which is part of the skylight itself. Another feature of the self-supporting skylight is the freedom from unsightly steel trusses, etc. in the skylight well opening and the consequent elimination of shadows and obstruction of light.

Structure Is a Unit—A study of the construction details on page A577 will show how this structure is assembled into a unit. Every part of the structure from ridge bar to curb functions in harmony. The interlocking sections prevent, beyond any question of a doubt, sagging at the ridge and in consequence spreading at the curbs. The rafter bars are $\frac{5}{16}$ in. thick by a depth suitable for the span without any intermediate supports whatsoever. Intermediate rafter bar spacers are employed at certain points between ridge and eave, usually directly under glass laps, thereby holding the rafter bars absolutely parallel and in perfect alignment from the ridge to eave. The rigidity of this structure when assembled is amazing.

Sweating Eliminated—As in the "Anti-Pluvius" skylight, sweating of the main supporting bars is eliminated by isolating the glass and its rest from the bars and so permitting free circulation of air between the glass and bars. As the bars are always dry there is no condensation to drip into the room. A chief cause of corrosion is thus removed and the life of the bars indefinitely prolonged. The bars can be painted on all sides without removing the glass.

Condensation Gutters—Are of ample size to take care of all condensation. The over-all width of the gutters, which is the widest point of light obstruction, is 2⅛ in.



Full Size Section Showing "Drou-Ve-Lite" Construction

Advantages of "Drou-Ve-Lite" Glass Structures

Drou-Ve-Lite Glass Structures of both regular and non-corrosive construction possess many advantages.

(1) Construction is entirely suitable for use over very small openings as well as exceptionally long spans, because the rafter bars are furnished proportionately to the size of the skylight.

(2) Easily adaptable to all types of roof construction.

(3) Positive watertightness.

(4) Sweating of rafter bars is eliminated.

(5) Each light of glass is independent of every other light. The lights do not come in contact with each other or with any metal.

(6) Glass rests on asphaltic felt bedding.

(7) Glass breakage is reduced to a minimum.

(8) Admit maximum daylight and cast minimum shadows.

(9) Structure is an absolutely rigid unit.

"Drou-Ve-Lite" (Non-corrosive) Glass Structures

This skylight in design and construction is identical with our Drou-Ve-Lite, the difference being only in the metals used. These are of non-corrosive materials (not a protective process). This construction is guaranteed absolutely against any form of deterioration for an indefinite length of time. The cost of this construction is surprisingly low considering the fact that it is a skylight entirely free from any maintenance expense. This construction is ideal for use on powerhouses, chemical plants, railroad shops, foundries, etc., as it will stand up indefinitely under the conditions existing in such buildings.

Sash Operators

If operators are required we can furnish the proper type to suit the conditions. We make three types of operators: "Straight Push," "Improved Lovell Dreadnought," and Worm and Gear, each unsurpassed in its class.

GENERAL SHEET METAL WORKS

Manufacturers of Skylights and Pressed Steel Sash Operators

BRIDGEPORT, CONN.

Cibulas Puttyless Skylights

Cibulas puttyless skylights are not carried in stock, but are built to take care of the proper span and conditions.

They are furnished with or without ventilators, in the following types: hip, turret, sawtooth, double pitch, single pitch and marquise.

Glazed with either ribbed or rough plain or wire glass, or plain actinic glass.

Outstanding Features

(1) Cibulas skylights are made entirely of heavy gauge, non-corrosive metals, No. 18 or No. 16 gauge copper, aluminum or galvanized rust-resisting metal. They are lasting; there is nothing to rot or deteriorate.

(2) They are built to prevent sagging or breakage under heavy wind or snow pressures and are perfectly weathertight and watertight.

(3) Their construction includes complete provision for contraction and expansion.

(4) They are suitable for all classes of buildings.

(5) They safely support a weight of 35 to 40 lb. per sq. ft., the bars being made in direct proportion to the length of the span.

(6) They dispose of all condensation. Gutters are made large enough to carry off water and prevent accumulation of dust and dirt.

Our Service to Architects

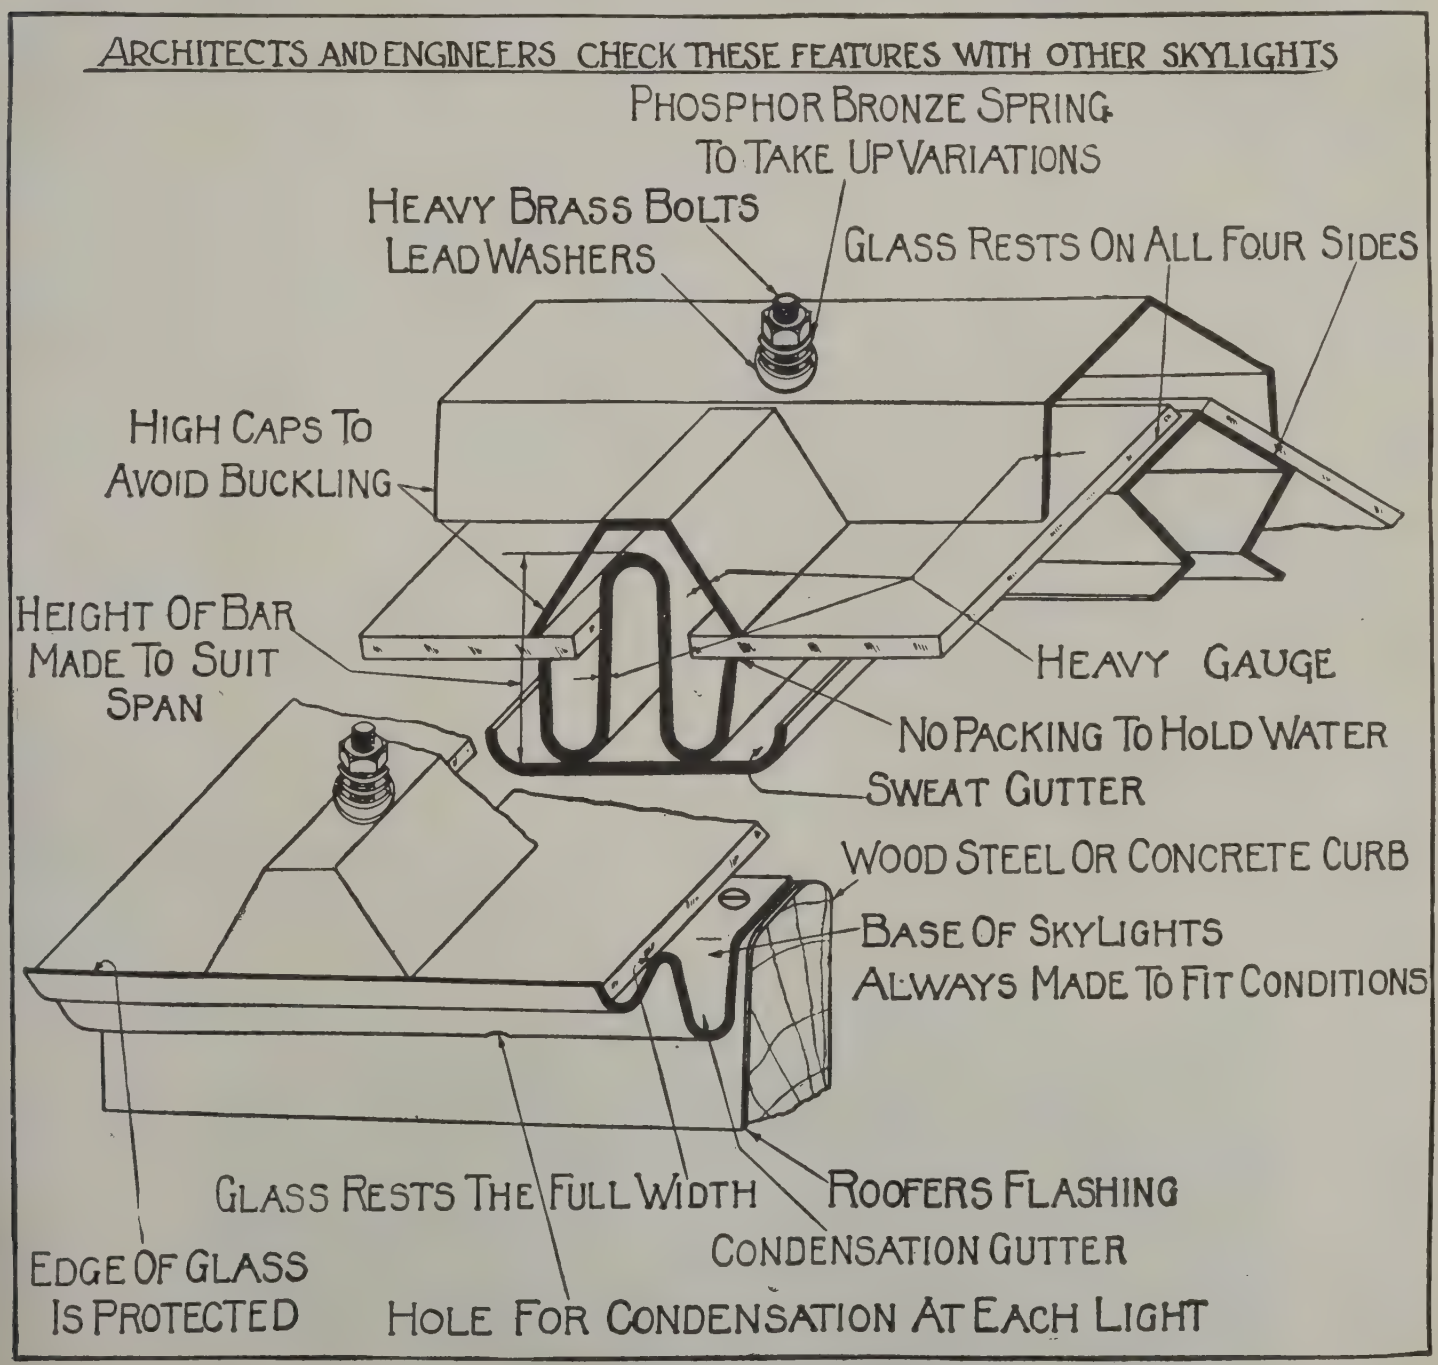
When desired, our engineers furnish complete detail drawings and estimates without obligating the architect.

Send for our latest catalogues, and chart for making curbs for all conditions to receive Cibulas skylights.

Specifications for Cibulas Skylights

Furnish and erect, where shown on plans, Cibulas Puttyless Skylights, manufactured by General Sheet Metal Works, Bridgeport, Conn., made of No. 16 [No. 18] gauge galvanized rust-resisting metals [of copper, using 48 oz. for the supporting bars and 18 oz. for the caps and gutter] [all-aluminum, $\frac{1}{16}$-in. thick].

Note: The glass commonly used in skylights is ribbed or rough plain glass, or ribbed or rough wired glass.



Detail of the Cibulas Puttyless Skylight

A. H. JETER & COMPANY, INC.

Manufacturers of Puttyless Steel Skylights

GENERAL OFFICE AND WORKS
496-498 Hancock Street
LONG ISLAND CITY, N. Y.

TELEPHONE
ASTORIA 4940

Products

PUTTYLESS STEEL SKYLIGHTS.

Also Sheet Metal Skylights, Turrets and Louvers; Architectural Sheet Metal Work of every description; Metal, Tile and Slate Roofing.

Services and Estimates

This company's estimating and drafting department is at the disposal of architects, engineers and owners. Estimates, suggestions, specifications and plans for its products will be gladly given on request. A large force of experienced men is employed, who have been carefully trained to erect the company's products.

When material only is supplied, complete instructions and drawings are furnished.

Facilities

This company's factory is situated in Long Island City, near the Long Island Railroad and Brooklyn Eastern District Terminal. This gives direct shipping facilities to any point in the world, either by railroad or water.

Jeter's Puttyless Skylights

Special Features—The sash bar of Jeter's patented puttyless steel skylight is composed of a lower channel, over which is placed a special moulded glass rest, secured to the bottom channel by means of wrought iron stirrups and tap bolts.

The glass rest is held in position by a brass bolt, which is of sufficient length to engage and secure the metal cap that covers the edges of the glass.

On the rolled steel glass rest, a cushion of heavy saturated asbestos is provided, running entirely across the glass rest. After the glass is laid in place, a saturated asbestos sealing strip is provided, which is securely held in place by the metal cap. This feature insures against any dust or moisture getting under the glass and into the sash bars or gutters.

A special moulded section is used as a continuous bottom support for the glass. This section also contains a pocket, on which is placed a strip of saturated asbestos upon which the glass rests. Connections at intervals of about 20½ in. are provided in the continuous bottom members, which receive and secure the bars. This method of asbestos cushioning device makes the skylight waterproof and dustproof and, being of a soft indestructible material, reduces the cracking of the glass to a minimum.

Adaptability—Jeter's patented system of puttyless steel glazing is adaptable for use in railroad terminals, museums, schools, hospitals, factories, machine-shops, etc.

The very simplicity of construction enables any mechanic to readily erect this system.

Specification for Jeter's Puttyless Skylights—Suggested for Architects' Use

All skylights shall be of rolled steel, of a type to allow for free expansion and contraction and made tight without use of paint, cement or putty.

Sash bar shall be composed of a special U-channel 2 in. wide and 1⅝ in. deep, made of high carbon steel ⅛ in. in thickness.

A rolled steel glass rest made of 1½x½x⅛-in. channel shall be provided. This glass rest shall be in the shape of a trough and shall be supported on wrought iron stirrups which will be tap-bolted through the walls of the special U-bar.

A heavy non-absorbent asbestos cushion shall be placed over the glass rest. Cushion and glass rest shall be securely fastened to the wrought iron stirrup by means of brass or copper machine screw.

A special continuous moulded member shall be provided at eaves of skylights. Between this member and the glass shall be placed a non-absorbent asbestos cushion and same drawn up tight under glass by means of bolts at bar centers.

After glass is set in place, provide a metal spring cap 1¾ in. out to out of flanges. This cap shall be underlined with a sealing strip of non-absorbent asbestos material, held in position by being punched and strung over the cap bolts. Edges of sealing strip shall not protrude beyond edges of cap. Securely fasten cap by means of a brass nut.

All skylights to be glazed with ¼-in. ribbed wire glass.

All caps, combing and trim shall be of (specify copper, zinc or galvanized iron).

After fabrication and before assembling the sash bars, all parts, shall be thoroughly coated with an application of bitumastic solution (or specify hot galvanizing).

Jeter's Top Ventilating Puttyless Skylights

A puttyless steel skylight made from the same steel section as our regular skylights, previously described. The steel channel bars form the top chord of a truss and are securely bolted top and bottom to a steel curb and ridge plate, of the same gage metal as the bar. When the curbs are tied by either angles or rods a perfect truss is thus formed which obviates the necessity of building up an independent steel truss as is usually the case. This method is successful in skylights not exceeding 12 ft. in width, but any length.

The ventilating sections at the ridge are made from sheet metal, either galvanized iron or copper, and are top hung by means of heavy iron butts, securely bolted

Installation of Jeter Top Ventilating Puttyless Skylights

Continued on next page

to continuous angles which run the entire length of the skylight. The sheet metal sash bars of this ventilator, *besides* being securely fastened to a stiffening member top and bottom, are again reinforced and tied with a 2½x½x⅛-in. channel which is fastened to the bars the entire length of the skylight with two ¼-in. bolts at each sash bar. This channel also receives the hinges of the operating device into which the push arms of the operators work.

The ventilating section is operated by heavy chain operators of the worm and gear type. Either side can be operated separately or independently of the other. Thus when one side is opened and the other is closed a suction is caused which "pulls" the dead air from the building; both sides can be opened if desired, which causes a natural forced ventilation from the building.

Standard Details

We have prepared drawings, showing plans, elevations, sections and details of this and many different styles of skylights, which will be forwarded on application, and when sufficient information accompanies request, recommendations will be cheerfully given as to the most economical and efficient practice. Send for drawing S-13.

Supplementary illustrated sheet for complete list of automatic and non-automatic skylights mailed on request.

Patents

"KUPE" Automatic Skylights and Ventilators are protected under various U. S. Letters Patents and the trade-mark "KUPE" is registered. Any infringement of patent or trade-mark rights, either in whole or in part, will be prosecuted.

Guarantee

All genuine "KUPE" products bear the trade-mark "KUPE", signifying excellence of workmanship and material assured by the long creditable reputation of a reliable manufacturer.

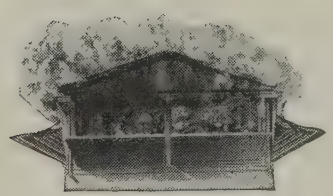
Estimates

Price lists are not available for general distribution, owing to fluctuation of market, etc. Quotations made upon application for specific jobs will be found extremely reasonable, considering the high grade product and service offered.

Inquiries

When writing, please mention job, location and architect in order to facilitate proper filing and closer estimating.

"KuPe" Standard Automatic Stage Ventilator No. 67



"KuPe" Standard Automatic Stage Ventilator No. 67
(Patented)

A combined ventilator and weather-proof skylight. It consists of a metal frame with hipped glass roof, and sides provided with bottom hinged metal shutters. Flexible cable equipped with fusible links passes over brass pulleys and connects the top of each shutter to a main rope which extends down to the stage floor. This main rope is also provided with fusible links. Under ordinary conditions the shutters are hand operated, but in times of emergency the shutters may be quickly opened by cutting the rope; in case of fire the operation of the shutters is effected either individually or simultaneously by the melting of said fusible links.

Connecting the top rail of the shutters with the head jamb is a jack-knife bracket which acts as a gravity lever in thrusting the shutters outward, overcoming any possible obstruction of ice, snow, or other encumbrances. This bracket also prevents the shutters from opening beyond a certain point, and holds same rigid against wind when open.

Gutters under the roof supports conduct condensation to the exterior.

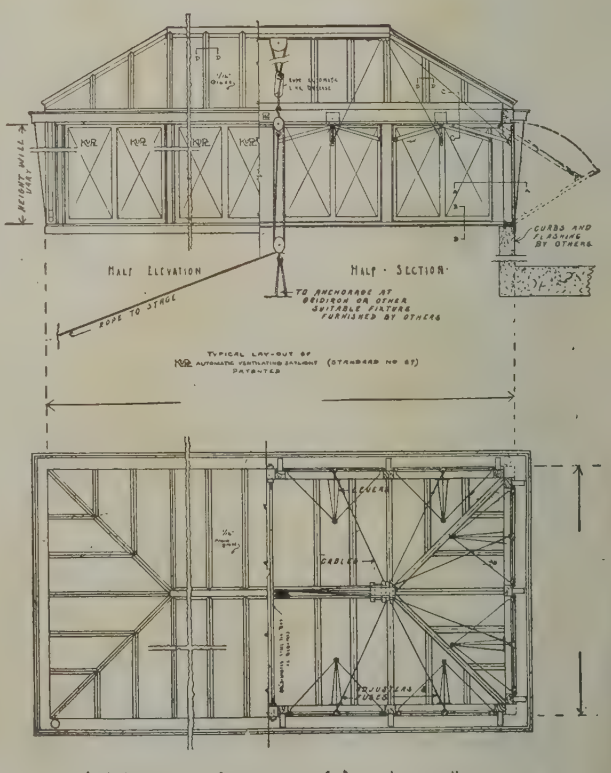
This is a scientifically constructed, efficient, self-opening ventilator, proof against obstruction by ice or snow, and positive in action under all conditions.

Construction and Installation—We manufacture and install these ventilators to any dimension, complete, glazed with 1/12-in. sheet glass and equipped with woven wire screen under the glass. We use standard gauges of galvanized steel (or copper) and the shutter hinge plates and pins are of brass.

Indorsement—Approved by the Board of Fire Underwriters, city officials, architects and owners.

Other Types—In addition to the above noted "Standard" design ventilators, we also control patent rights for the sole manufacture of various other stage skylights, including those equipped with exterior or interior bracket and weight control door, as well as those embracing the falling hood arrangement.

Installations—Prominent theaters, high schools, parochial schools, public auditoriums, masonic temples, etc., throughout the country, are now equipped with the "KuPe" Stage Ventilator; list of these installations will be gladly furnished on application. Limited space here prevents itemized mention.



½ PLAN OF HIPPED ROOF ½ PLAN LOOKING UP

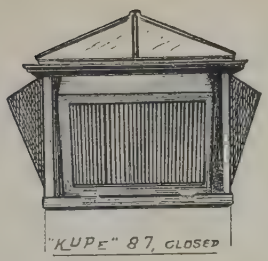
"KuPe" Standard Automatic Stage Ventilator No. 67
(Patented)

Note: Shutter openings will vary in height to conform with area of skylight shaft

Stages having no gridiron will require a beam across center of roof opening to act as an anchorage for tackle-blocks. (This anchorage not in "KuPe" contract.)

Continued on next page

"KuPe" Simplex Automatic Stage Ventilator No. 87



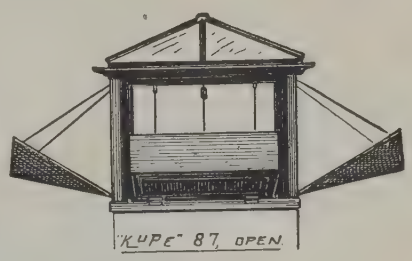
"KuPe" Simplex No. 87 Closed
(Patented)

This is another type skylight meeting with popular favor, owing to the extreme simplicity of operation.

This ventilator, like all others of the "KuPe" manufacture, is of pleasing design and exceptionally strong construction.

The sides and ends being of heavy gauge galvanized metal, while the hipped top is formed of special galvanized bars, hips and ridge to receive glass and equipped with wire screen under same; according to standard New York City requirements.

As shown in illustration, the operation of "KuPe" Simplex No. 87 is entirely on the gravity principle. The manual release of main rope or the melting of fuse links causes the cover hoods to fall downward away from the various openings, leaving the entire unobstructed area clear for immediate escape of smoke and fumes; a feature only possible in "KuPe" construction.



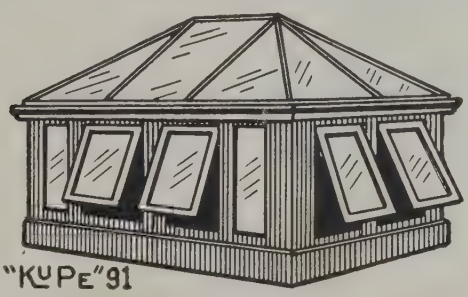
"KuPe" Simplex No. 87 Open
(Patented)

Note: This type of stage ventilator is manufactured only in square sizes up to 5x5 ft. to permit assembled shipment (without glass) often desired by purchasers who desire to install their own ventilators.

"KuPe" Automatic Dye House Skylight No. 91

This ventilator is of special design, arranged to meet a condition requiring the automatic closing of sashes in case of fire and the opening of same to allow exit for expanded gases at time of explosion.

These galvanized steel (or copper) skylights are manufactured complete (except glass) in sizes up to 5x6 ft. ready for shipment and installation by purchaser; larger sizes, if required, must be forwarded knocked down and will require assembly at job by either our own or other practical mechanics.

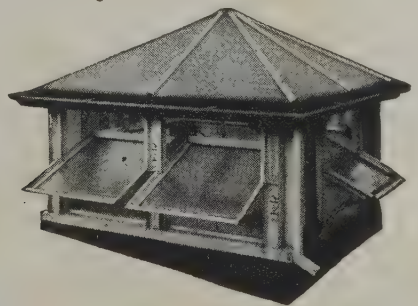


"KuPe" Automatic Dye House Skylight No. 91

"KuPe" Automatic Quick Acting Ventilator Skylight No. 66

A combined ventilator and skylight that operates instantaneously. It consists of a rectangular metal frame having a hipped roof of glass. Designed especially for immediate vent action in time of emergency.

The sides of the structure consist of vertical sash openings, fitted with side pivoted sash.



"KuPe" Automatic Quick Acting Ventilator Skylight No. 66

Struts from the bottom rail of these sash connect with a runner which is on a fixed vertical rod.

A chain from this runner extends to a point suitable for manual operation, where it passes through a key slot arrangement permitting the sash to be opened simultaneously and locked in any desired position.

Sash may also be opened thermally, if so desired, by means of a fusible link.

The weight of the operating device effects a positive opening action on sash when the chain is released. When closed, head of the sash swings under the rain shed, flanges on the side stiles fit into grooves on the panels, the apron on the bottom rail overlaps the sill, making the sash stormproof.

Gutters under the roof support conduct condensation to exterior.

Construction and Installation—We manufacture these skylights of standard gauge galvanized steel (or copper) and deliver same f.o.b. Brooklyn, N. Y., complete (except glass) ready for installation by the purchaser in the following sizes: 2x3 ft., 3x3 ft., 3x4 ft., 4x4 ft., 4x5 ft., 4x6 ft., 5x5 ft., and 5x6 ft.

Larger sizes also furnished; these, however, are shipped knocked down and will require assembly at job by practical mechanics.

When requested, quotations will be made based on complete manufacture and installation by us. (Architects desiring this method should specify accordingly.)

Indorsement—"KuPe" Automatic Ventilating Skylight No. 66 is approved by architects, engineers, contractors and owners after rigid tests and inspection.

Recent Installations—Include dairies, baking plants, cabinet mills, ice cream and candy factories, markets, storage houses, automobile works, garages, schools, chemical plants, furniture warehouses, office buildings, acetylene works, laundry buildings, hospitals, doctors' and dentists' offices, residences, emporiums, hotels, clubhouses, department stores, police stations, etc.

Itemized lists of these would be impossible in the space allotted here.

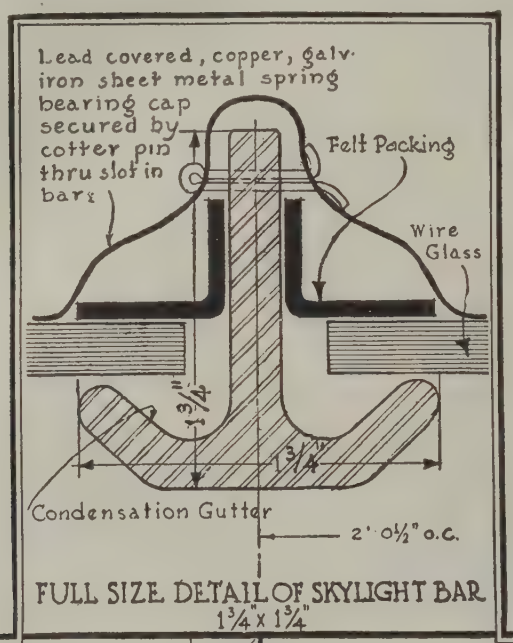
THE HOWIE COMPANY, INC.

Manufacturers of Skylights
9011 Central Avenue
DETROIT, MICH.

Products

PEERLESS SKYLIGHTS.

Also manufacturers of Fireproof Windows, Tin Clad and Metal Covered Doors, approved by Underwriters' Laboratories, Inc.; Copper and Bronze Doors, Architectural Sheet Metal Work.



FULL SIZE DETAIL OF SKYLIGHT BAR
1¾" x 1¾"

Peerless Skylight, Sawtooth and Marquise Constructions

These are designed to provide a weatherproof and dustproof skylight construction and one guaranteed against any and all possible glass breakage due to vibration, or through expansion and contraction due to temperature changes.

Specifications for Peerless Skylight and Marquise

Intent—This specification together with the accompanying drawings and details is intended to provide for all labor and material required for the completion and erection of all skylights as shown or mentioned.

Work by Others—All steel framing, wood curbs, nailing strips, gutters and roof flashings, shall be provided for under another contract, unless otherwise specified.

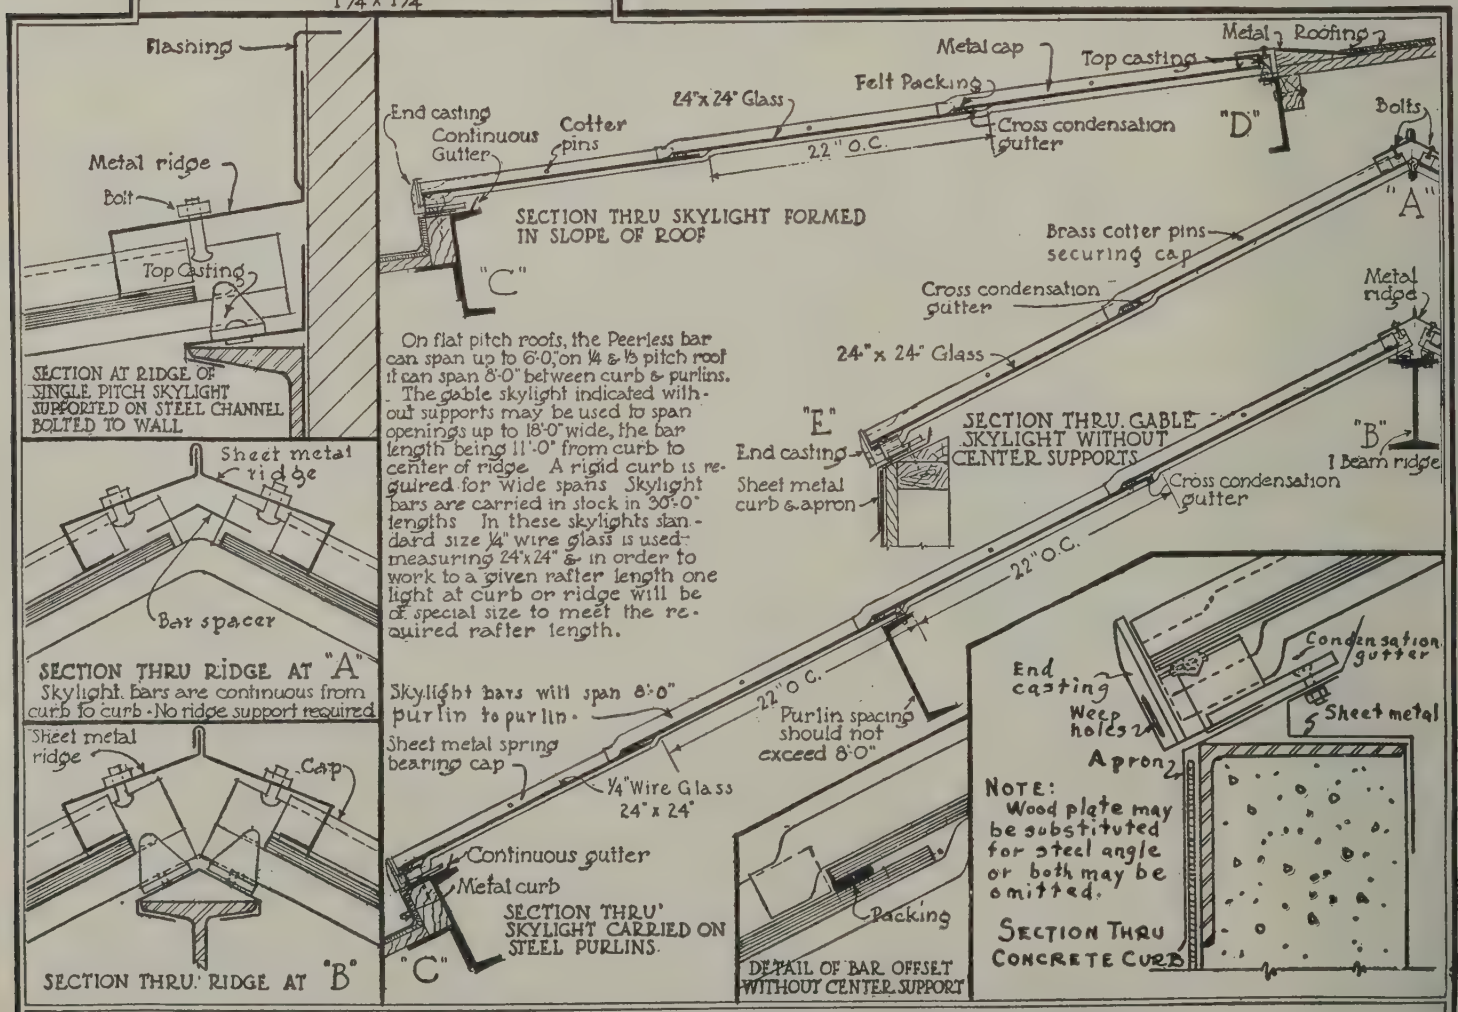
Work Required—Provide and install all skylights as shown or indicated on drawings. All skylights shall be "Peerless" skylight construction as manufactured by THE HOWIE COMPANY, INC., DETROIT, MICH., complete as shown by their standard details, and adapted to the construction of the building.

All sheet metal trimming shall be of No. 24 gauge galvanized iron [or 16 oz. cold rolled copper] [or No. 11 zinc].

Glazing—All skylights to be glazed with best quality ¼-in. rough wire glass not to exceed 24 in. in width. All glass to be left whole and clean at completion of the work.

Painting—All metal work in connection with skylight, except copper or zinc, shall be painted; also paint all skylight bars with 1 good coat of approved paint.

Guarantee—This contractor is to furnish a written guarantee for 5 years.



DETAILS OF PEERLESS SKYLIGHTS

NONPAREIL SKYLIGHT CO.

Manufacturers of Nonpareil Puttyless Skylights

MAIN OFFICE

2609-2611 Pennsylvania Avenue, N. W., WASHINGTON, D. C.

Product

The NONPAREIL PUTTYLESS SKYLIGHT (patented November 1, 1910; October 3, 1911; October 14, 1913).

Some of Our Claims, for Our Construction

(1) It can not, and does not leak.

(2) Glass breakage with this construction is reduced to a minimum.

(3) A highly practical construction.

(4) Our lead glazing cushions are practical and lasting. Detail 5, Fig. 1.

(5) These cushions are *not* attached until after all field work is done, therefore, they are always in perfect condition when the glass is put in place.

(6) They are reversible, so that in case of accident to the glass and they are injured, they can be reversed for installing new lights of glass—very advantageous feature.

(7) Our condensation gutters are so made, and of such size, as to really and properly perform the functions they are supposed to perform. Details 6 and 7, Fig. 1.

(8) Our bars are made from lead coated ingot iron in standard construction, and of cold rolled copper when so specified. They are also of the proper size and section, to make the best and most practical job. Details 6 and 7, Fig. 1.

(9) Our bolts and nuts are made from cold drawn brass (*not cast brass*) and all our exterior castings are brass.

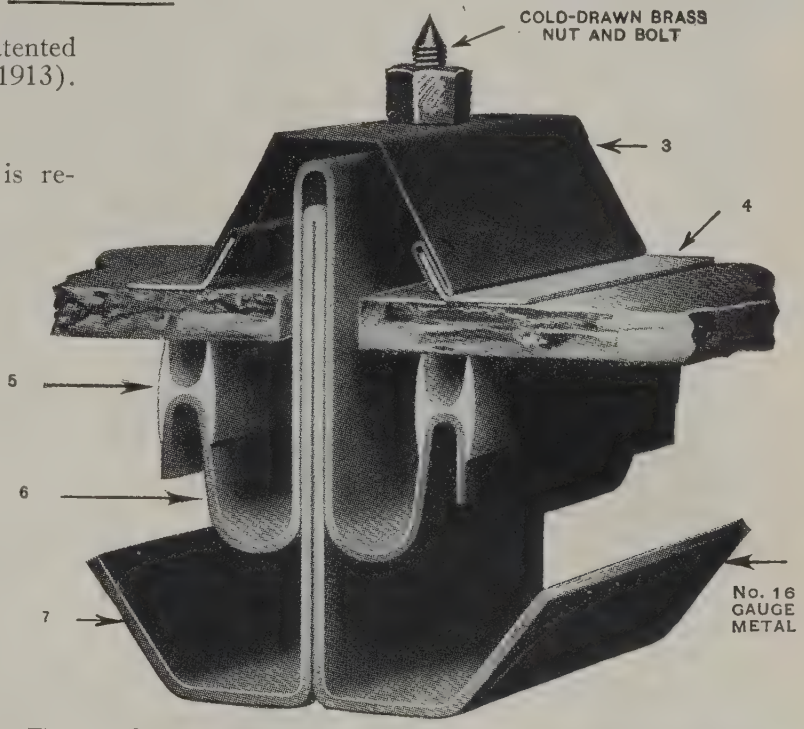


Fig. 1. Complete Bar Assembled, Showing the Glass and Details of Construction
(Patented November 1, 1910; October 3, 1911; October 14, 1913)

Specifications for Nonpareil Skylights

The skylights must be of a type that can be made watertight without the use of putty, and shall *not* contain any material other than metal and glass in their construction, and, where shingle of flexible type is used, it must not be more than ⅝ in. from one plane of glass to the one below.

NATIONAL VENTILATING COMPANY

Manufacturers of Puttyless Skylights

GENERAL OFFICE AND FACTORY

75 Tenth Street
LONG ISLAND CITY, N. Y.

TELEPHONE
STILLWELL 5733, 5734

Products

MULTI-UNIT PUTTYLESS SKYLIGHTS.

Also manufacturers of Side Lights, Operating Sash, and National Ventilating Devices; all kinds of Sheet Metal Products; Drawing and Stamping.

Adaptability

Skylights for railway terminals, power stations, machineshops, factories, foundries, libraries, museums, art galleries, and all other buildings whereon permanent watertight skylights of large area are required.

Advantages and Distinctive Features

Referring to Fig. 4 on following page, the bar and upper lights are supported in a fixed manner by the purlin thereunder; while the lower bar, supporting the lower lights, is secured by the same purlin in a loose manner, permitting it to expand freely.

This construction, being repeated at each purlin, permits movement, all in same direction, due to expansion, contraction, or vibration (along the slope of the skylight) of the cap, glass and bar of each unit or tier of glass, independently of every other unit or tier.

Along the longitudinal line of the skylight the steel frame of the building and the entire length of the glass are each taken as separate units, and the difference, nearly 100%, in the expansion and contraction of these materials (glass and steel) is likewise thoroughly taken care of by the copper spreader clips shown in transverse section at supporting bar (Fig. 2). These spreader clips are placed over each cap bolt, spaced about 10 in. along each skylight bar, and incidentally they serve also to better secure in place the brass bolts for holding the caps.

The cap is strong and yet resilient. Its upper half is of an inverted "U" shape, which provides strength and rigidity; while the lower half, especially at the lower extremities, is resilient, so as to conform thoroughly, when secured in position, to the surface of the glass.

All gutters and parts that are non-accessible, without removing the glass, are of non-corrosive material. The entire top of the bar is covered with 8-oz. copper, the same being applied while the last coat of bar-paint is still wet; and a flexible bearing for the glass is formed, which adjusts itself to any warps or irregularity of the glass along its bearing line.

The company is equipped to cover the bottom of the bar also. Both the top and bottom bar covers are made by special dies and both fit the bar snugly.

No packing or filling substance of any kind is required, and no material is used other than glass and metal.

Standard Specification, Multi-unit System Puttyless Skylights

All curb and roof flashings shall be included under heading "Sheet Metal Work." They must be well connected, ready to receive the skylight work, and must include all necessary counter flashing, well secured to roof flashings and made water-tight.

The skylights shall be of the puttyless type, of a design to allow for free expansion and contraction, or movement due to vibration, of the glass and supporting bars in line with the pitch of roof, *all in the same direction.*

Each light of glass shall be entirely independent of every other light, so that one light does not support another; and the glass shall be held laterally in a manner to prevent its coming in contact with any rigid part.

The bearing for the glass shall be flexible, so as to adjust itself to any warps or irregularities of the glass along its bearing line.

The caps shall be spring bearing, in order to thoroughly conform along the lines of contact, when secured in position, to the surface of the glass.

All bar gutters shall be of copper and all exposed parts other than sheet metal shall be of brass.

The supporting bars shall be of rolled steel, and shall be held in a loose manner at the upper end and in a fixed manner at the lower end.

Packing, filling substance of whatever kind, or material other than glass and metal shall not be used.

All skylight sheet metal work shall be [copper] [zinc] [galvanized iron].

The glass shall be ⅜ in. thick [wire] [plain] [ribbed].

Adopted by Leading Railroads

The Pennsylvania Railroad Company, after carefully examining all other types of puttyless skylights in actual service, adopted the construction herein shown and described for its new New York & Long Island Railroad Passenger Station, 31st to 33d Streets and 7th and 8th Avenues, New York City, on which building this company completed, about 15 years ago, the erection of 83,000 sq. ft. of skylight, embracing nearly every known variety, such as hipped, ridge, flat, barrel-roof, sawtooth with bowed ridges, circular, elliptical, etc., all constructed with flat glass.

The Central Railroad of New Jersey adopted this system of skylights for its new terminal at Jersey City, N. J., where 116,000 sq. ft. of this construction has been installed.

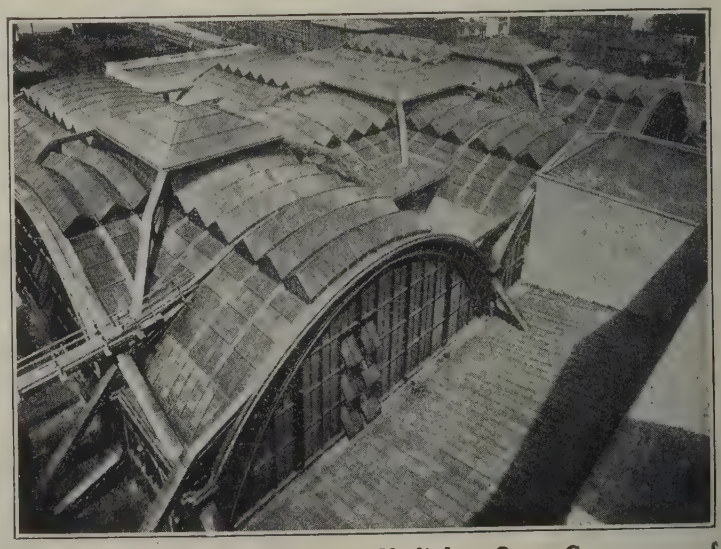

Fig. 1. Group of Multi-unit Skylights Over Concourse of Pennsylvania Terminal, New York, N. Y.

Area of this group, about 50,000 sq. ft. Total area on the terminal, 83,000 sq. ft.

(Patents applied for)

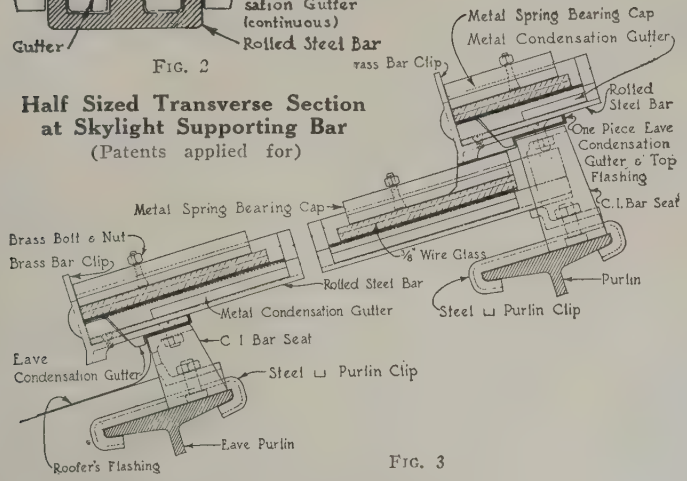

FIG. 3

Reduced Scale Cross Section from Eave to Next Purlin Above
(Patents applied for)
Construction shown on the right side is repeated at each purlin between the eave and the ridge
Scale, 2 in. equals 1 ft.

The New York Central Railroad Co. also has this construction on its new Grand Central Terminal at 42nd Street, New York City; on its New York City Power House at 50th Street and Lexington Avenue; Power Stations at Yonkers and Port Morris, N. Y.; Boiler Shops at West Albany, N. Y., Reed & Stem, Architects, and for their new Passenger Station at Utica, N. Y., Stem & Fellheimer, Architects.

Result of Thorough Investigation

The system of skylight construction described here is the result of experience and investigations made by the NATIONAL VENTILATING COMPANY in this line over a period of nearly 20 years.

All efforts during this time have been directed to producing, not the cheapest, but the best construction. As to skylights, true economy does not consist in buying the cheapest.

Solid Wire Glass—Rough, Ribbed, Polished, Corrugated (CWG), Figured, and Actinic Glass.

Also Glass without wire netting, in various patterns and thicknesses, to suit every requirement.

TRADE-MARK

Wire Glass

Process—Solid wire glass, made by the Pennsylvania continuous process, is completely formed by one pouring and one rolling; the only process that makes possible the manufacture of wire glass as thin as ⅛ in.

Fire Protection—Wire glass is a valuable fire retardant—it prevents flames from attacking adjacent buildings.

Approval (Distinguishing Mark)—All of our wire glass, ¼ in. and over in thickness, has the full approval of the National Board of Fire Underwriters as a fire retardant, which requires a distinguishing mark to identify the glass. Our distinguishing mark is our *cabled strand*, appearing every 10 in. across the sheet and the full length of each sheet.

Service—We offer gratuitous engineering advice on all glass problems.

Samples—Samples, catalogues and circulars on request.

Specifications—Architects should always specify "Solid Wire Glass manufactured by the Pennsylvania Wire Glass Company" (mention the kind desired).

Corrugated Wire Glass

CWG is a corrugated sheet of glass with wire netting incorporated.

Corrugated Wire Glass Skylight—Corrugated wire glass is made to meet the demand for a substantial skylight, admitting properly diffused light. CWG can be placed on a roof of any material, including corrugated iron and corrugated asbestos.

Uses—CWG can be used also on roofs, sidewalls, marquises, canopies and wherever *daylight* is desired.

Weight—CWG weighs about 4½ lbs. to the sq. ft.

Strength—CWG has strength many times greater than any other glass of equal thickness, owing to the corrugations.

Kind—CWG is made in deep angle, 2½ in. center to center of corrugations.

Standard Size—27¾ in. wide by 42 or 64 in. long, or any length up to 126 in., conditions governing.

Specifications for Installation of CWG

The skylights, roof or sidewall construction, where marked "Corrugated Wire Glass" on the plans and elevations, shall be formed of Corrugated Wire Glass (if Actinic Corrugated Wire Glass is wanted, say "Actinic Corrugated Wire Glass"), with standard fittings of 18-oz. copper and brass (can be furnished, if desired, in Armco iron, zinc, aluminum or lead), in accordance with details and instructions submitted.

Instruction and Details for Erecting

To assist the architect in detailing and supervising the erection of Corrugated Wire Glass Skylights we have prepared complete instructions and detail drawings. Some of the drawings from this book are presented on the following page and the publication, Bulletin D3, will be sent upon request.

Corrugated Wire Glass Roof, Government Printing Office, Washington, D. C.

Actinic Glass—An Aid to Industry

Why Actinic Glass Is Needed

No one in these times would build a dark and gloomy factory with a few small windows. Yet in modern daylight construction, with its large glass areas, the problems of glare in various forms and of excessive heat from direct sunlight cannot be evaded.

Actinic Glass solves these problems so successfully that literally acres of it have been installed in new industrial buildings.

How It Differs from Ordinary Glass

Without going into technical details, the reasons why Actinic Glass reduces glare and also the heat of sunlight, lie in its special chemical composition. As to appearance, it looks like ordinary rolled glass, except it has a tint technically described as an "unsaturated yellow."

Facilitates Production by Reducing Eyestrain

Glare in various forms is such a hindrance to workers that it obviously increases manufacturing costs and impairs quality of output. As an illustration, when the sun is shining through an ordinary window or skylight, such objects as white paper or light colored textiles are often so glaringly illuminated that it may be actually painful and injurious to the eyes. When, on the other hand, Actinic is used under such conditions a person can even read print upon white paper with comfort. The relief is so pronounced that it can scarcely be appreciated without seeing an actual comparison.

Small samples for this purpose will be sent free upon request.

Improves Morale by Moderating the Sun's Heat

Daylight factories glazed with ordinary glass often suggest a florist's hothouse. The best proof of relief from heat gained by Actinic is its extensive recent use in mills of the south where it is specified by leading architects.

As indicated by thermometers, the discomfort due to direct sunlight is reduced about 55% by ¼-in. and about 40% by ⅛-in. Actinic.

Saves Costs of Curtains, Painting, etc.

Mills with large areas of Actinic have found it unnecessary to use shades or awnings, or to paint their windows, although if colorless glass had been used, glare and heat would admittedly have been intolerable.

Other Advantages

More cheerful illumination.

Improved ability to see, and retardation of undesirable chemical changes, such as fading of colors, add to the general satisfaction given by this novel product.

Technical details will be cheerfully furnished upon request.

Designs and Thicknesses

Actinic Glass is made in the following designs and thicknesses:

⅛-in. plain rough or ribbed
¼-in. rough or ribbed wire
Corrugated wire glass

Actinic Glass Used in Entire Building, John Van Range Company, Cincinnati, Ohio

Architectural Sheet Metal Work

GREENSBURG, PA.

Products

GOODWIN AUTOMATIC STAGE VENTILATOR.

For Metal Covered Doors, see pages A976-977.

Also manufacturers of Special Architectural Sheet Metal Products, including Marquees, Cornices, Skylights, Roof Ventilators, Gutters and Conductors.

Goodwin Automatic Stage Ventilator

Constructed of heavy galvanized sheets reinforced by structural steel members of sufficient cross section to support many times the wind and snow loads that may be expected. This construction is so substantial that even in case of fire the Goodwin Automatic Stage Ventilator will not be damaged greatly unless the supporting members of the roof structure are destroyed.

Primarily designed for fire protection purposes, the Goodwin Automatic Stage Ventilator may also be used for natural gravity ventilation by installing a ventilator along the ridge or by placing sash in the base. If light is desired the sash in the base may be glazed.

Operation—Should a fire occur on the stage of any theater which is provided with a Goodwin Automatic Stage Ventilator the first slight increase in temperature causes a fusible link to separate and allows the heavy sections to roll down on both sides. The sections assume a vertical position, providing a clean open space the full area of the ventilator for the free discharge of smoke and flame.

The proscenium arch being fully protected by the asbestos curtain, the entire stage and equipment may be completely destroyed without any material damage to the auditorium.

Sizes—The Goodwin Automatic Stage Ventilator is built to any desired width and length.

Engineering Service

We will be glad to co-operate with architects, engineers, contractors or owners and offer our Engineering Service without obligation.

GLENDON A. RICHARDS CO.

Manufacturers of Puttyless Skylights and Revolving Ventilators

Winter Avenue and Blumerich Street, Northwest
GRAND RAPIDS, MICH.

Products

The Simplicity Puttyless Skylight; the Simplicity Skylight Ventilator; the Ventwell Revolving Ventilator.

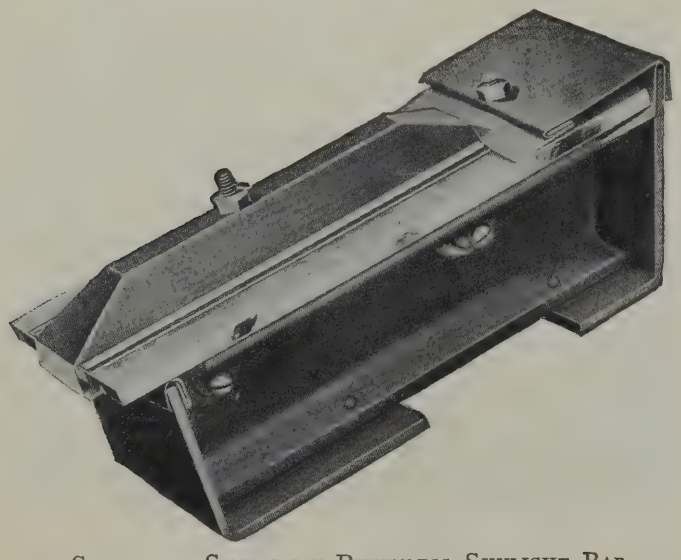
Simplicity Puttyless Skylight

Our aim in designing this skylight was to provide a product which would combine the maximum amount of daylight per square foot of area, with the lowest maintenance cost possible, and at the same time be of such construction as to lend itself to erection in the field with a minimum amount of time and labor.

The simplicity Puttyless Skylight consists of a steel supporting frame of tee iron rafters with angle curb and ridge members. The rafters are provided with sheet metal condensation gutters over which the glass (set in came lead glazing strips or channels) is laid. The mounting caps are set in place over the glass and secured, compressing the glazing channel firmly against both sides of the glass. The ridge cap and end flashing is then applied completing the assembly.

Steel Frame—The sizes of the steel members comprising the frame vary to suit conditions. Ridge and hip members are made in two sections (details on following page); this form of construction allows the frame for each slope, consisting of rafters, ridge and hip members, to be assembled complete at the factory. The erection work in the field is reduced to bolting the ridges and hips together and anchoring frame at curb.

Glazing Strips—These strips are small channels of came lead placed on the edges of the glass resting on the rafter members. When the mounting caps are set and secured they compress the lead firmly against both sides of the glass, making an absolutely windtight and weathertight joint. The soft lead takes up any unevenness in the surface of the glass and gives a continuous bearing surface; it also permits enough come and go in the glass to provide for contraction and expansion, thereby eliminating glass breakage from either of these sources.



Section of Simplicity Puttyless Skylight Bar

Materials—The sheet metal work consisting of the mounting cap, ridge cover, condensation gutter and flashing may be of lead coated metal, galvanized iron or copper.

Advantages—Absolutely weathertight construction; maximum amount of daylight; condensation conducted to the exterior; glass breakage reduced to a minimum by use of lead glazing strip; ease of erection; ease of glass replacement.

Specification—Furnish and erect where shown on plan, skylights of the puttyless type, of a design to allow for free expansion and contraction of the glass, or movements due to vibration.

Each light of glass shall be entirely independent of every other light and the glass shall be held laterally in a manner to prevent its coming in contact with any rigid part.

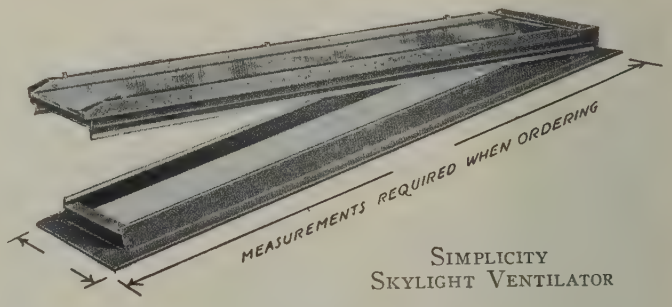
The bearing of the glass shall be flexible, so as to adjust itself to any warps or irregularities in the glass.

Simplicity Skylight Ventilator

These ventilators may be placed in any of our skylights by removing the glass and substituting the ventilating frame.

These ventilators are also made with flat flanges for use on shingle or composition roofs.

We manufacture an efficient and reliable operating device for these ventilators. Prices and description will be sent on request.



Simplicity Skylight Ventilator

"Ventwell" Revolving Ventilator

This ventilator revolves with the wind and is so constructed that the action of the outside air creates a vacuum in the ventilator itself thereby drawing up the air to be expelled. It is efficient, and guaranteed to give satisfaction under all weather conditions.

It may be had in either galvanized iron or copper.

Bases and dampers extra.

Prices quoted on application.

TRADE-MARK

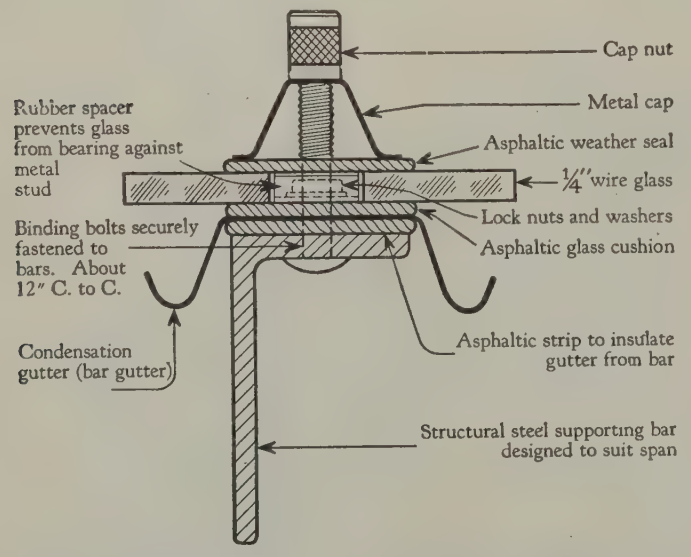
Robertson Skylights

Robertson Skylights represent the most successful solution of the two most frequent and aggravating causes of skylight troubles—that is, leakage and glass breakage, growing out of (1) deflectation (or sagging) of the glass supports, and (2) improper methods of holding the glass in place.

The detail drawing at the bottom of this page and the perspective drawing at the top of the following page show clearly how these difficulties have been overcome.

Eliminating Sagging—As shown in the drawings, the supporting member of the Robertson Skylight is a standard structural steel bar, designed and fabricated like the steel framework in a building, and as strong as the other structural members of the building. Its strength is calculable; all steel formulae apply to it. Size and weight of the bar is varied to suit exact conditions of load and span. The steel has a *minimum* thickness of $\frac{3}{16}$ in. Robertson Skylights therefore can be as wide as 20 ft. without deflection and without need for supporting trusses.

Research has shown that deflection in the supporting member must not be more than 1/30th in. per foot of span. In Robertson Skylights there is never more than 1/30th in. deflection, even under a load of 40 lb. per sq. ft., and with a safety factor of 4.



Cross-sectional View Showing Details of Robertson Glazing Construction
For further description see text herewith

The Strength Is Permanent—Corrosion in skylights usually starts in the condensation gutter. In most skylights, this gutter is a part of the supporting member, and when the gutter corrodes the supporting member is weakened. In Robertson Skylights (as you can see in the drawings) the condensation gutter is a separate unit and does not touch the supporting bar. Between it and the bar is a layer of asphaltic felt. If corrosion starts in the gutter there is little danger of it spreading to the bar of a Robertson Skylight.

Also, the supporting bar is no more affected by corrosion than is any other *structural* member of the building. It is so arranged that it is easy to reach with a paint brush from all sides. In extremely corrosive conditions, the bar can be galvanized, or covered with asphaltic coatings (such as used in the construction of Robertson Protected Metal).

Proper Cushioning of Glass—The second great cause of trouble in most skylights is improper methods of holding the glass. Skylight glass has an irregular surface. When this surface rests on an unyielding bed, it makes contact at some points and not at others. This results in unequal stresses. As shown in the illustrations, the glass in Robertson Skylights is not laid on metal or other unyielding surface, but is bedded in a layer of asphaltic felt (shown just above the condensation gutter in the drawing). This felt is flexible, resilient, and semi-plastic. It conforms to the irregularities of the glass and makes a firm but not rigid, contact. It allows for expansions and contractions. And it makes a continuous, water-tight seal.

Above the glass (see drawings) another layer of this asphaltic felt makes the same sort of easy cushioning contact from the top. Above this, in turn, is the final unit of the skylight . . . the metal cap. It is a continuous strip, shaped somewhat like an inverted V, which runs the entire length of the joint. This cap is so designed that it has a spring-like effect. When tightened by a nut and bolt, it exerts a continuous, evenly distributed binding action along the length of the skylight, forcing the semi-plastic asphaltic layers into the depressions in the glass surface, yet its tension is so flexible that it allows fully for expansion.

All Glass Butt Jointed—Another advantage of Robertson Glazing Construction is that where two panes of glass come together, they are always butt jointed, *never lapped*. The glass is all in the same plane: the panes can never slip; and there is no obstruction to form a lodging place for snow, water, or dirt. The edges of the glass are held in weatherproof copper cross-gutters.

Continued on next page

Curb Details—Details of built-up curbs of the commonly-used types are shown on this page. You can use these details to trace directly on your blue prints. Perfect curb details on your plan will often save two or three weeks in delivery time on skylights.

Show out-to-out dimensions of curbs and state whether skylight is to be double-pitch or hip type. If double-pitch, indicate whether ends are to be built up of the same material as curb, or are to be covered with metal, or to be of glass.

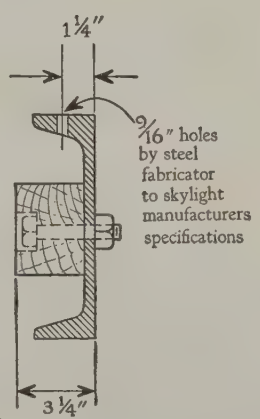
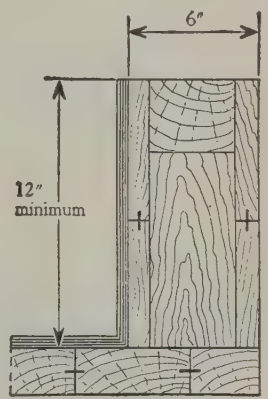
Detail of Concrete Curb



Detail of Steel Curb



Detail of Wood Curb

A Typical Skylight Specification

The skylights shall be of the puttyless Type "A," manufactured by the H. H. Robertson Company of Pittsburgh, Pennsylvania, and shall conform to the following description:

The skylight bars shall be of standard rolled steel shapes that can be accurately figured for deflection. They shall support a combined snow and wind load of 40 lb. per sq. ft. without a deflection greater than 1/30th in. per lin. ft. of bar length, measured center to center of supports. This deflection is to be calculated from the deflection formula for simple beams (safety factor of 4).

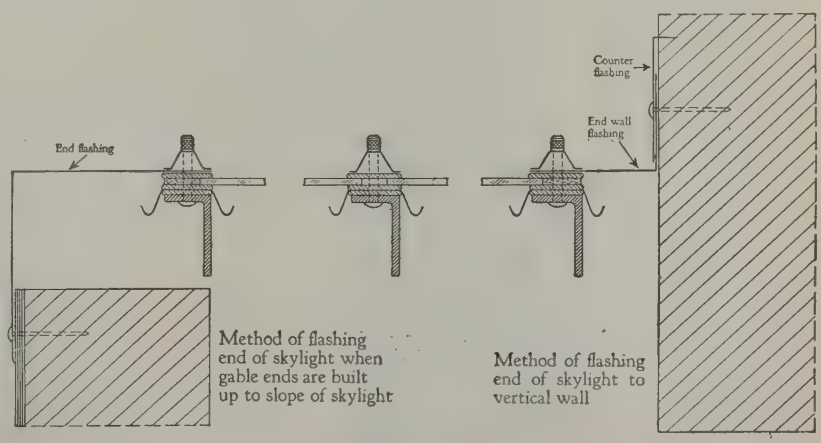
The bars shall be equipped with condensation gutters. They shall not be an integral part of the load-carrying member.

The glass shall be ¼ in. wire, and shall be embedded in a soft pliable and permanent asphaltic material.

The bars shall be covered with caps, which are to be fastened to bars by stud bolts and knurled nuts.

The trim shall be [copper] or [galvanized iron]. In case where two or more different materials meet, they shall be insulated from each other by asphaltic strips.

Detailed drawings shall be submitted by the manufacturer for the approval of the architect, engineer, or owner.



Flashing Details

Robertson Double-Glazing

The Robertson Double-Glazed Skylight is one of the most important developments in glazing construction in recent years. It has been designed to overcome the difficulties encountered where considerable differences in temperature exist between the inside and outside of buildings, and where the indoor air carries excess humidity.

It minimizes condensation and drippage, reduces heat losses through skylights, and cuts fuel bills. In hot climates, it keeps buildings cool and comfortable in spite of high temperatures outside. In paper mills, textile mills, turbine rooms, power houses, swimming pools, and many other types of buildings where heat radiation and condensation are above the average it is of special benefit.

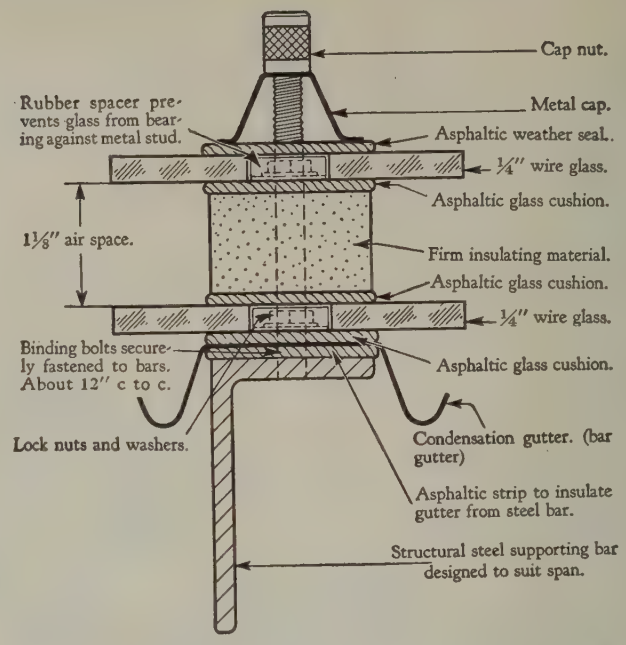
The great advantage of Robertson Double Glazing over single glazing lies in the fact that the two layers of glass with an air space between them greatly increase the heat insulation. The heat transmitted through a single glazed skylight with ¼ in. glass is approximately 1.12 B.t.u. per sq. ft. per hour for each degree of temperature difference; whereas the heat transmission of Robertson Double Glazing is only .133 B.t.u.

The large illustration on this page shows the method of attaching the skylights to the curb. The curb illustrated is concrete, but these skylights can be attached readily to steel, wood or any other standard form of construction. The illustration shows the position and attachment of the necessary flashings to make a weather-tight union between the skylight and the curb.

The Robertson perfected system of removing the water of condensation is shown in the drawings on this and the next page. Condensation on the underside of skylight glass is usually caused by differences between indoor and outdoor temperatures. Double glazing gives greater insulation between the indoor and outdoor temperatures, and this reduces condensation. Whatever condensation *does* occur forms principally between the layers of glass rather than on the inside of the bottom layer; trapped between the two panes, it cannot drip down into the building.

Water on the upper surface of the lower pane runs down the slope and out through a ¼-in. weepage space (see detail of curb) at the bottom edge of the pane, whence it drips into the interior gutter. This interior gutter runs continuously along the curb and empties into conductor pipes (as shown) spaced at regular intervals. These pipes carry water onto the roof, or, if preferred, into the building.

Water on the bottom surface of the upper glass runs down to the edge of the exterior apron flashing (see detail) then drips down through the ¼-in. space at the edge of the lower pane; thence into the interior gutter. The ¼-in. interval is not only an outlet for water but also provides for the slow continuous movement of air between the two layers of glass, and this air motion helps carry away moisture.

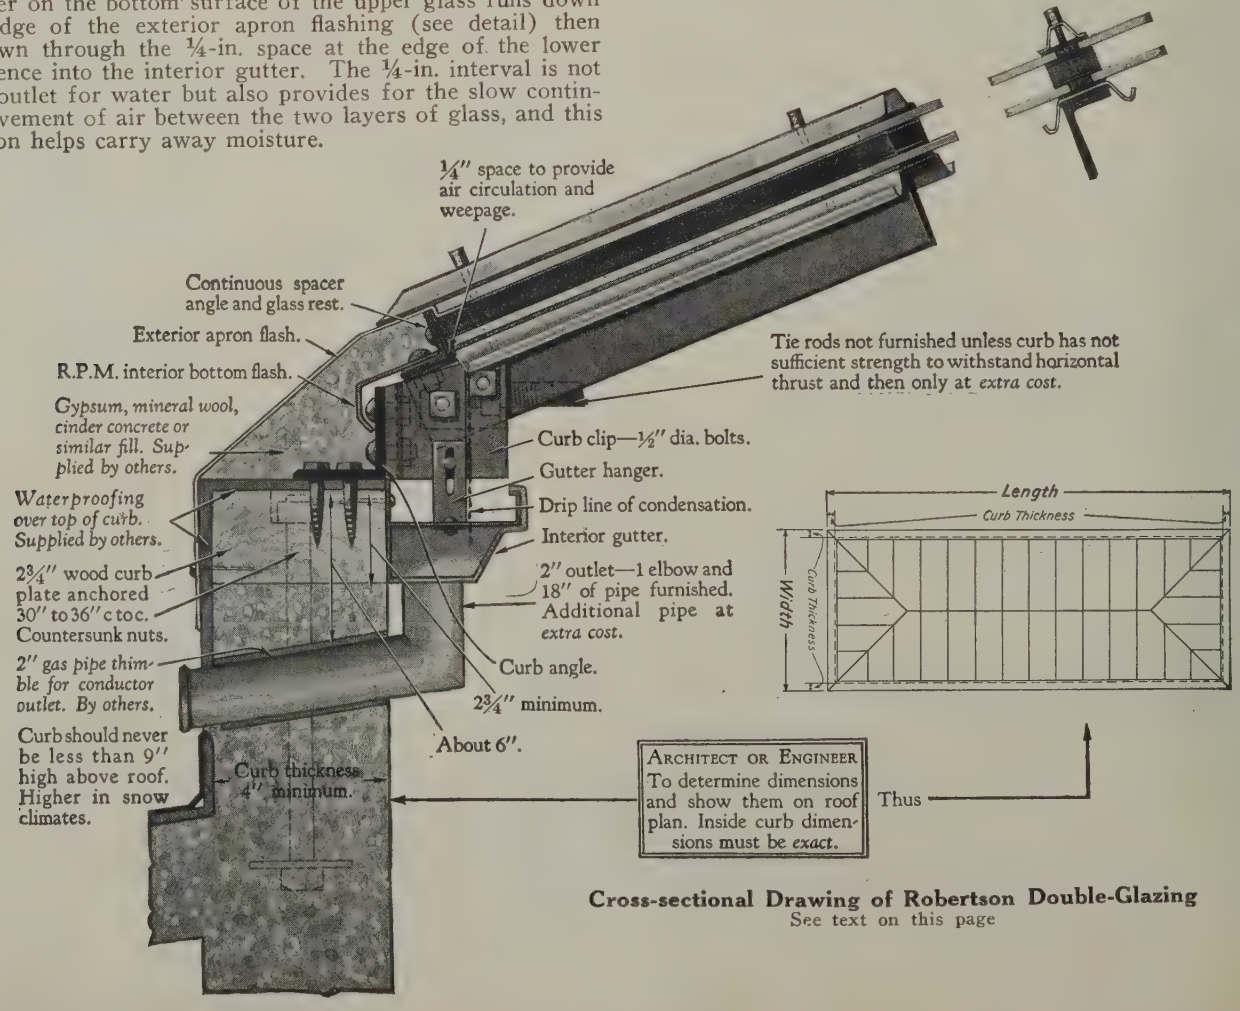


Cross-sectional Details of Robertson Double-Glazing

For general information see text on this page

Any water that may form on inside of the lower pane is caught in cross condensation gutters (as shown in the cross-section of the large detail and in the "close-up" in the upper left hand corner of the next page). Water gathering in these cross gutters empties into the bar gutters running up and down the slope, then into the interior curb gutters and out.

Interior bottom flashings should always be of Robertson Protected Metal (which is impervious to corrosion). Other sheet metal parts and flashings may be of copper, aluminum, galvanized steel or other suitable material. Interior gutters are made of the same materials as the trim. Studs or binding bolts are always made of brass.



Cross-sectional Drawing of Robertson Double-Glazing

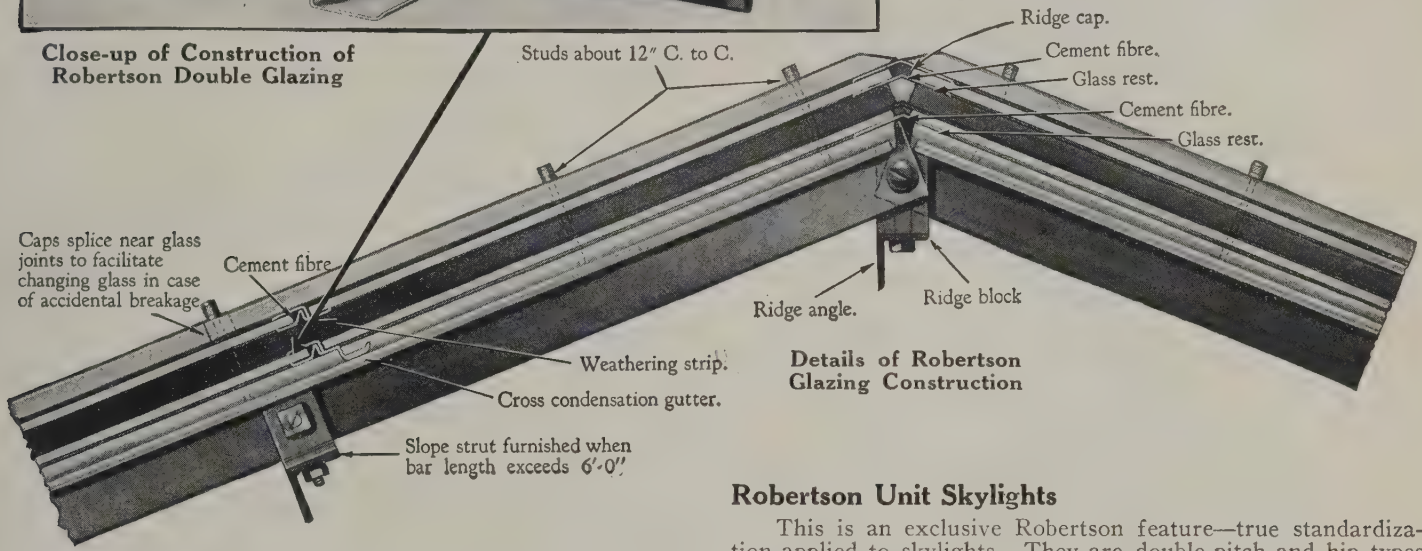
Close-up of Construction of Robertson Double Glazing

Available in All Forms

Robertson Glazing Construction is available in all forms: double-pitch and single-pitch skylights, hip skylights, monitor and special sash sawtooth sash, sidewall sash, fixed and operating; and complete glass roofs. Also in standardized unit skylights.

The H. H. Robertson Company is equipped to take your blueprints or rough preliminary sketches and recommend the most suitable type of glazing construction to meet the situation . . . to suggest the number of skylights or sash that will be needed, what size they should be and where they should be placed. Send for 48-page Robertson booklet on Daylighting which explains many of the fundamental rules governing the daylighting of buildings.



Details of Robertson Glazing Construction

Depressed Head Construction

The Robertson method of installing single-pitch skylights (known as depressed-head construction) is illustrated at the bottom of this page. Note how the head of the skylight is inserted under the roofing material, and the bottom of the skylight is extended out over the roofing material, to facilitate the free flow of water, and to eliminate any place of lodgment for snow, water, ice, or dirt.

Depressed head construction eliminates the necessity for curbs and for "saddles" or "crickets" to carry off the water. It can be used with any type of roof material or roof coverings, where the slope of the roof will permit use of skylights. Slope must never be less than 2½ in. in 12 in.

Depressed head construction can be made to fit a multiple span, covering any number of purlin spacings up the slope. Robertson Glazing Construction in single-pitch skylights can have a clear span of as much as 11 ft., which is unusually long. Beyond that distance it is well to supply intermediate purlins.

Robertson Unit Skylights

This is an exclusive Robertson feature—true standardization applied to skylights. They are double-pitch and hip types in units of standard widths from 3 to 20 ft. and in any desired lengths.

Ordering in Even Foot Widths

Skylights are primarily planned in even foot widths. If ordered on that basis, considerable savings in both time and money can often be made, and much quicker deliveries are possible. *However, Robertson Skylights can be delivered to you in any widths you desire.* Widths should be figured on the out-to-out of curbs.

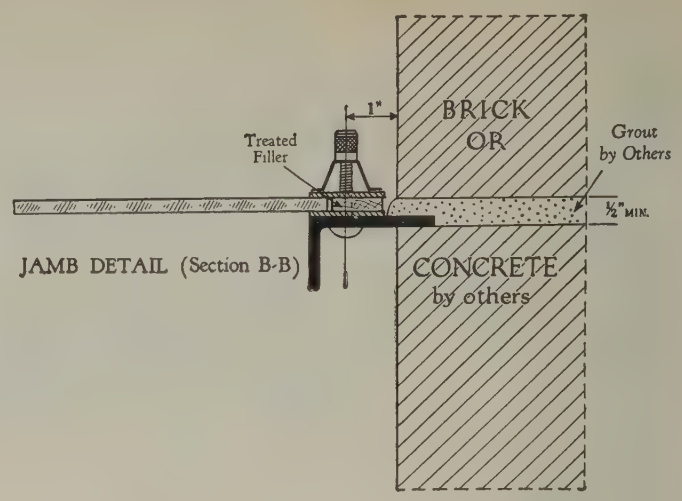
CROSS-SECTION DETAIL
(Section A-A)



JAMB DETAIL (Section B-B)

Details of Robertson Structural Sidewall Sash for Buildings of Brick or Concrete

For description see text

Robertson Structural Sidewall Sash

The name of this Robertson product suggests what it is—an industrial sidewall sash with load-carrying members of structural steel. The glass is supported on standard rolled steel bars placed vertically and attached (in the case of steel buildings) to the girt framing.

The special features and advantages of Robertson Structural Sidewall Sash are:

Greater Strength—All supporting members are of structural steel instead of light steel sash. Bars are designed like beams and can take care of any required loading. Glass is ¼-in. wire glass instead of ⅛-in. window glass.

Longer Lived—The structural steel supporting bars provide a weight of metal and a consequent resistance to corrosion that light steel sash cannot approach. On the outside, the only exposed metal part is the tension cap, which is made of corrosion-resistant aluminum. Horizontal members are few and are made of aluminum almost flush with the surface of the glass, so that there is no place for corrosive elements to lodge. Glass is held in resilient asphaltic felt strips; no metal touches it; no putty is used.

Low Maintenance—There is less glass breakage; no puttying to be done; and little or no painting. The aluminum tension caps and the horizontal members never require paint.

Remarkably Adaptable—Robertson Structural Sash is designed and fabricated to fit sidewall openings of any dimensions or proportions.

Easier to Clean and Keep Clean—The glass panes are large (2x6 ft. maximum). There are fewer corners and bars, and fewer places for dirt and dust to lodge. All horizontal members practically flush; it is possible to wipe, in one operation, a section of glass 6 ft. in height.

More Light—The large panes give more effective lighting than the small panes of ordinary sash set in a network of bars.

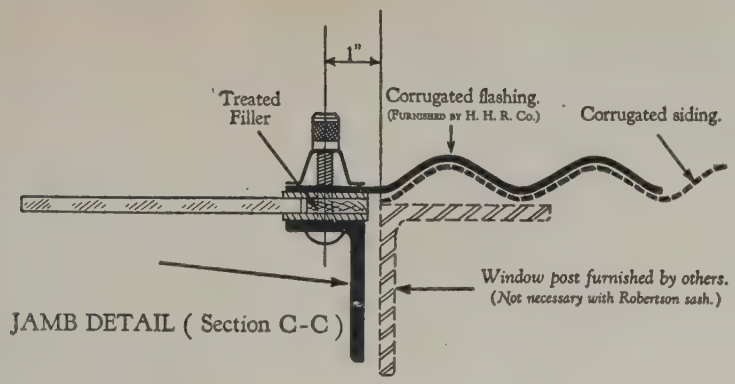
Better Appearance—The large panes provide a fine architectural effect; they form an appropriate relationship with the masses and lines of a structure. The bright aluminum caps harmonize in tone and color with the glass.

Key to Illustrations—Illustrations on this page show cross-sectional views of details of Robertson Structural Sash applied to buildings of brick or concrete.

Section A-A (vertical section through sash) indicates method of attaching at head and sill. With brick, Robertson Structural Sash is fitted at the head into space left by steel contractor between lintel angles. In concrete, sash is fitted into a similar space provided by concrete contractor. At sill, sash is fastened to brick or concrete by means of lag screws (as shown).

Section B-B is horizontal sectional view through the sash and its attachment to window jamb. As indicated, position of sash bar is modified at this point; glass-holding members are attached to longer leg of the bar, and the longer leg is inserted into the brick or concrete. Sash is weatherproofed by grouting as shown.

Continued on next page



JAMB DETAIL (Section C-C)

Key to Illustrations—Cross-sectional views on this page show Robertson Structural Sash applied to buildings with sidewalls of corrugated sheets.

Section A-A (vertical section through sash) indicates method of attaching sash to head and sill. Girts placed as shown in Section A-A are recommended; but Robertson Sash can be adapted to any type of steel framework.

It is also adapted to window openings of any height. Panes of glass come in any height up to 6 ft. For openings more than one pane high, union between upper and lower edges of pane made by standard intermediate section shown in Section A-A.

Girts to which sash is attached to be furnished and punched by building owners. Section B-B shows typical girt-punching layout. Center lines through angle lines in B-B indicate exact location of girt punchings. Sash bars should be spaced on 24-in. centers if possible, but can be varied to meet requirements of *any* opening.

Section C-C (horizontal sectional view through the sash and its attachment to window jamb) shows how Robertson Structural Sash is weatherproofed at the points. Because of strength and rigidity of Robertson Sash bars, no window posts needed.

Tension caps, which form outside or weathering member, furnished in aluminum, copper or galvanized steel.

Operating Devices

If operators are desired for side wall sash we can furnish tension or torsion types, with chain, handwheel, pole or electric drives.

CROSS-SECTION DETAIL
(Section A-A)

Details of Robertson Structural Sidewall Sash for Corrugated Buildings

ESTABLISHED 1885

SAINT PAUL CORRUGATING CO.

Manufacturers of Skylights, Steel Buildings, Steel Ceilings

3-23 West Water Street, SAINT PAUL, MINN.

Products

SAINT PAUL SKYLIGHTS (puttyless or putty type).

Also manufacturers of Saint Paul Guaranteed Steel Ceilings, Pruden System Steel Buildings, Sheet Metal Building Material, including Cornices, and Stamping and Spinning Work in Copper, Brass and Zinc.

Adaptability

Skylights for industrial plants, paper mills, machine shops, railway terminals, school buildings and all other structures where adequate lighting is a requisite.

Distinctive Features

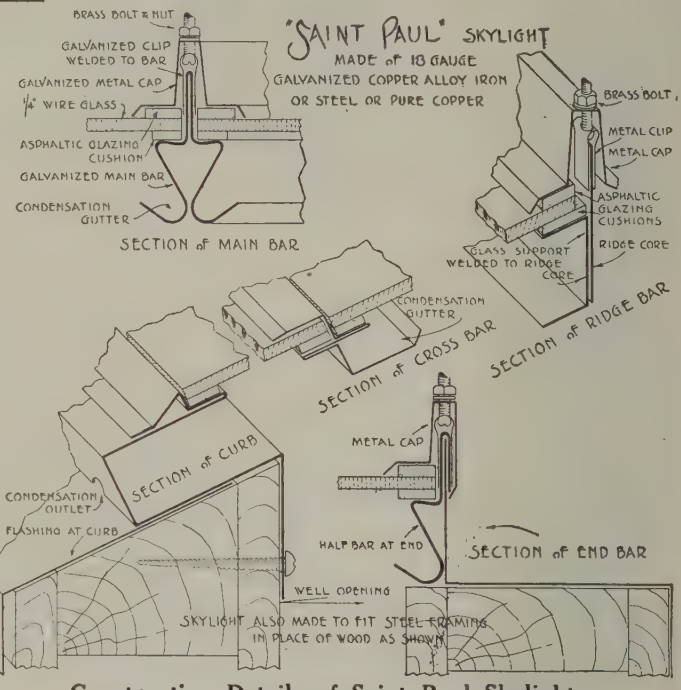
By examining the detail drawing of the Saint Paul Skylight you will note that the main bars interlock at the ridge, also at the curb. This interlocking feature, together with the construction of the ridge and hip bars, adds considerably to the strength of the skylight. Settlement which may be caused by weight of glass and climatic conditions is entirely eliminated.

A metal flashing insert around wall and skylight which is formed with a projected drip is entirely a separate member and is not a structural part of the skylight. It can be put in place either before or after the skylight is set up.

All glass supporting bars and curb are provided with condensation gutter of ample size, the condensation being carried through the interior by these gutters and to the exterior through weep holes in the curb between each main bar.

On Big Freight House

The Chicago & Northwestern Railway selected the Saint Paul (putty type) Skylights for its freight transfer house at Proviso, Ill., covering 21 acres. This transfer house is in 12 units (see below), three skylights going into each unit, 36 skylights in all. Each skylight provides a glass area of 3740 sq. ft.; total area under glass 134, 640 sq. ft.; 16,000 panes of wire glass glazed in putty. All skylight bars and caps are machine cut, and all formations power pressed. Curb, ridge and supporting bars are 18 gauge. The bar caps are 24 gauge.



Construction Details of Saint Paul Skylight

The job required 420 ventilators (also made by us). They are 24 gauge, Saint Paul oval dome type.

Drawings Available

We shall be glad to supply drawings, showing plans, elevations, sections and details of Saint Paul Skylights (puttyless or putty type) on application. Ask for Drawing 28, stating which type is desired. Also if you give us workable information, we shall be glad to give you our suggestions based on long practice as to the most efficient and economical form of construction for your particular job.

Everything in Sheet Metal

Our General Catalog G shows our entire line of Saint Paul Sheet Metal Products. Available on request. Samples of materials and products supplied gladly.

ESTABLISHED 1888

BARNEY GOLDMAN, Pres.

SUPERIOR SKYLIGHT COMPANY, INC.

Automatic Gravity Theater Ventilators

95 Webster Avenue, LONG ISLAND CITY, N. Y.

Products

Superior Automatic Gravity Ventilator.

Also Yard, Floor and Roof Drains; Sheet Metal Work of every description.

For Superior Roof Leader Connections and Expansion Roof Fittings for Vent Stacks, see pages C2792-2793.

Superior Automatic Gravity Ventilator for Theater Stages and Auditoriums

A combined ventilator and skylight. Universally approved for use over the stages of theaters, fraternal buildings and school auditoriums. Efficient, reliable and automatic in action in case of fire.

Operation

The operation and automatic action depend on a series of hempen cords, each of which is attached to a sash or ventilator and which are immediately released, either independently or all at once, by the melting of fusible links, such as are in common use on fire doors, sprinkler systems, etc. They will melt and release the ventilators at a temperature of 160° F.—long before the flames reach them.

The ropes connecting with the sash are brought down to the stage and attached to a triangle plate which is connected with one main rope to the stage floor. Chains are also attached to the ropes permitting the manual opening and closing of the sash from the stage floor.

The automatic ventilator is to be mounted on an ordinary curb of concrete or angle iron frame made level with the wood plate set flush with the outside of the curb. The curb should be not less than 2 ft. 6 in. high from the finished roof in order that snow drifts and other encumbrances will not prevent outward gravitation.

The roof of the ventilator skylight is to be of first class hip ridge construction with heavy bars and condensation gutters, glazed with a thin glass in accordance with the New York Building Code and made perfectly watertight. A No. 12 Galvanized 1-in. Underwriters wire mesh is placed underneath this roof to gather in the glass which invariably breaks from excessive heat in case of fire.

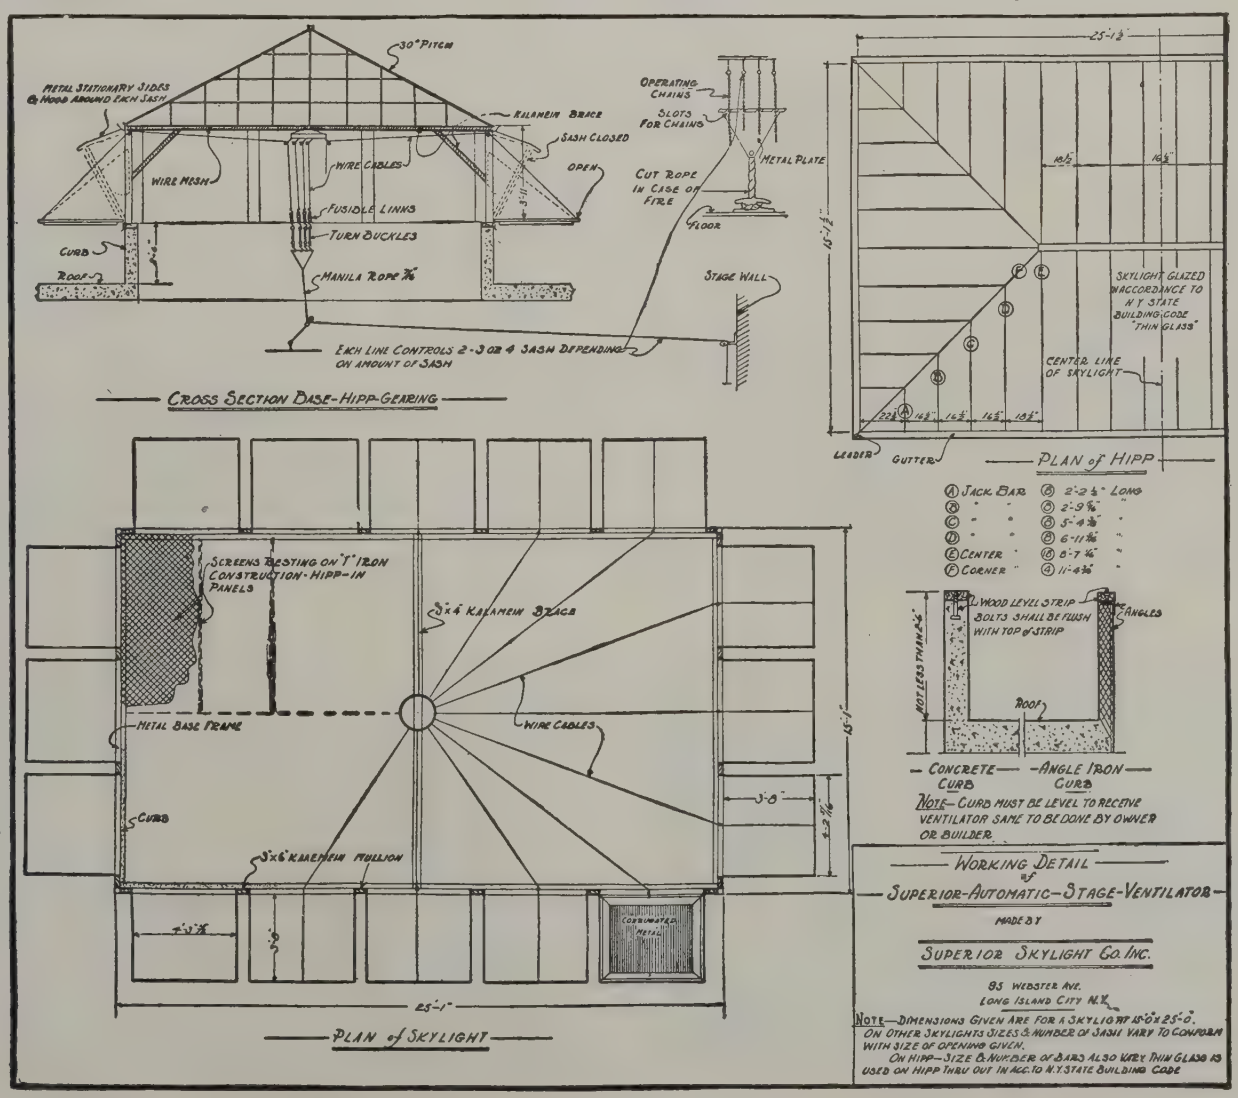
Construction and Installation

We manufacture these ventilators to any specified dimensions using standard gauges of galvanized iron or copper, and will deliver them, ready to assemble, to any part of the United States, Canada and Europe.

We will supervise their installation and guarantee that they will meet with the approval of local fire marshals, inspection bureaus, fire insurance underwriters, etc.

Endorsement

Superior standard automatic ventilators are constructed in a manner approved by the National Board of Fire Underwriters, and in accordance with "An Ordinance Regulating the Construction and Equipment of Theater Buildings, and Auditoriums as approved by the National Fire Protection Association and the Board of Standards of the City of New York."



ESTABLISHED 1873

E. VAN NOORDEN COMPANY

Puttyless Skylights

TELEPHONE
HIGHLANDS 3040, 3041, 3042

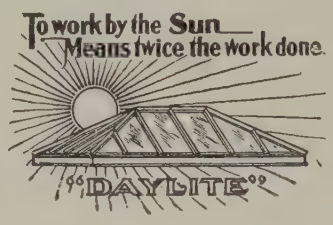
100 Magazine Street, near Massachusetts Avenue
BOSTON, MASS.

Products

Manufacturers of "ANCHOR-BAR" ROLLED STEEL PUTTYLESS SKYLIGHTS.

Also manufacturers of Sheet Steel and Copper Skylights of every type, Sheet Steel or Copper Windows and Trim, Kalamein Doors and Windows; Bois Steel Stairs.

For Roof Ventilators and Steel Door Bucks, see page A647.



TRADE-MARK

Rolled Steel Puttyless Skylights—"Anchor-bar" Type (Patent No. 931638)

The Van Noorden rolled steel "Anchor-bar" puttyless skylight is designed particularly for large skylight areas, and is a most economical construction for skylights where the bar length exceeds 8 ft. *Fewer purlins* and *steel supports* are required than for any other skylight.

This company solicits from architects an opportunity of suggesting framework for any type of glazed roof structure, and a saving in the steel framework required is assured.

The structural parts of rolled steel, and the trim of sheet metal (generally copper), form a combination which can not be surpassed; namely—steel for strength and copper for weather protection.

Bar—The bar consists of a tee and angle combination as shown. The angle member serves as a gutter for condensation. Glass rests loosely on cushion of pure wool felt.

Curb—The "Anchor-bar" skylight is the only skylight of prominence which has continuous steel reinforcement at the base. The thrust of skylight bars is directly against this member, which can not give way while the curb holds.

General Features—The distinctive feature of "Anchor-bar" skylight is the unit steel frame, consisting of bars, base and ridge—an independent self-supporting steel structure, upon which the glass is loosely bedded; after which, the exposed portions, such as bar caps, ridge caps, base and side apron of sheet metal (generally copper), are applied. Caps are secured with brass bolts.

Expansion and Contraction—Owing to the fact that the sheet metal parts of "Anchor-bar" skylights are independent of the rolled steel parts, expansion and contraction are amply provided for. Glass sets loosely on the cushion of wood felt, thus there is no possibility of breakage due to expansion and contraction.

Accessibility for Re-painting—A feature to be recommended in "Anchor-bar" skylights is their accessibility for the easy repainting of the rolled steel portions. The sheet metal portions, being preferably of copper, are impervious to weather conditions.

Adaptability—"Anchor-bar" skylights are recommended wherever overhead light is desired. Inquiries should state over-all length of outside of curb, bar length, pitch of skylight (5 in. to the foot, or more) and distance between intermediate purlins.

"Anchor Truss Bar" (Patent No. 1140909)—"Anchor Truss Bars" are used where bar length is more than 10 ft., unless intermediate purlins are provided. Truss bars are self-supporting for a bar length up to 15 ft. The saving effected in the steel frame support is far greater than the excess cost of truss bar construction. Details on application.

Product

VENT-O-LITE SOLDERLESS VENTILATING SKYLIGHTS.

TRADE-MARK

Construction Features of Vent-O-Lite Skylights

Supporting Trusses—Vent-O-Lite Skylights are supported by trusses built of 2x1½x⅛-in. angle iron, spaced approximately 6 ft. on centers. These trusses carry the entire load and require no special preparatory construction, except the curb.

Panels, Ridge, etc.—The bars, rails, ridge, end panels, etc., are all constructed of 18 gauge galvanized iron, and the entire skylight is made rigid and weathertight *without the use of solder*. Ample provision is made for condensation at all necessary points.

Operating Device—A heavy rack and pinion type operating device of special design is furnished as an integral part of Vent-O-Lite Skylights. This device facilitates smooth and even operation. Little effort is required to quickly raise sash to any desired position. Tubular shafting prevents loss of torque and insures permanent ease of operation in both raising and lowering the ventilating sash.

Glass—¼-in. wire glass set in putty and securely held by 18 gauge galvanized iron glazing caps.

Flashing—Vent-O-Lite standard curb flashing consists of a 6-in. strip of heavy 3-ply asphalt felt underneath a 24 gauge galvanized iron curb strip which extends 2 in. below the top of the curb.

Paint—The entire skylight is given one coat of mineral paint before it leaves the factory.

Sizes—Vent-O-Lite Skylights are manufactured in standard widths of 6, 8, 10, 12 and 14 ft. and can be furnished to any length in multiples of 2 ft. Greater widths can be furnished when required.

Ventilating Feature—Vent-O-Lite Skylights can be furnished either part or full length ventilating as required.

Shipments from Stock

Since we maintain large stocks of standard sizes at all times, we are always able to make prompt shipments of Vent-O-Lite Skylights, to all parts of the United States.

Erection

These skylights are regularly quoted with glass and erection included. However, when desired, shipment may be made knocked down for erection by the customer.

Vent-O-Lite Service

Vent-O-Lite Service includes assistance in designing for better light and ventilation in garages, industrial buildings, etc.

Details and suggestions for special applications furnished on request.

AMERICAN BAR LOCK CO., INC.

Manufacturers of "Barlock Transparent Roofing" for Skylight and Roof Light Construction

LONG ISLAND CITY, N. Y.

BRANCH OFFICES OR REPRESENTATIVES IN ALL LARGE CITIES

"Bar Lock Transparent Roofing" for Skylight, Roof Light and Floor Light Construction

Designed for permanency, protection of glass from breakage, leakage and maintenance expense. It is mechanically correct and is as strong and durable as the walls of the building. Can be walked on; is wear, burglar, fire and water proof. Requires no protecting screens. Will support the loads required, and withstand the action of the elements. Not affected by smoke or acid fumes. No maintenance cost.

Advantages of "Bar Lock Transparent Roofing"

The surface will harbor neither water nor dirt.

Glass units are cushioned with a specially prepared waterproof composition. Galvanized cast iron frames entirely surround each unit of glass for its full depth, providing perfect protection against concrete expansion.

The ½ in. thick wired glass is of the replaceable type, and can be replaced by unskilled labor without any cutting of concrete, leaving of patch work or liability of leakage, should any ever become broken by accident or abuse.

Expansion joints relieve pressure, and are calked and made watertight with oakum and "Bar Lock" calking compound. Spans, up to 8 ft. in the clear without intermediate supports, for any type of building.

Construction of "Bar Lock Transparent Roofing"

Made in completed factory finished slabs ready to drop over the openings, or we will send our own mechanics, if preferred, to install in the field anywhere in the United States.

Specification

"Bar Lock Transparent Roofing" Double Reinforced Concrete Construction using 8¼ in. square, ½ in. thick, wired glass, protected by galvanized cast iron shields, with a signed guarantee to furnish glass for replacement free of charge (f. .o. b. factory) for a period of 5 years.

Guarantees

We guarantee to maintain all work against defective workmanship and materials, and any leakage caused thereby, for a period of one year.

The AMERICAN BAR LOCK CO., INC., further guarantees to furnish glass for replacement in the "Bar Lock" wired glass skylight construction free of charge (f. o. b. factory) for a period of 5 years.

NEW YORK, N. Y.

For Transoms and Ventilators, see pages B2194-2195

3-Way Armored Sidewalk Lights (Glass Guaranteed for 5 Years)

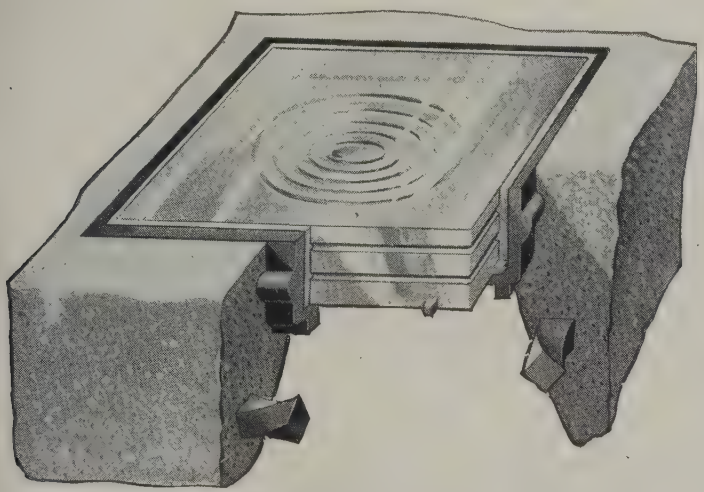
Daylight in basements and vaults is more important today than ever. Sunlight and Daylight make for health and efficient operations.

3-Way Armored Sidewalk Lights accomplish this in more of a permanent way than any other light medium we know of.

Abundance of daylight. Lasting qualities in construction. And practically no maintenance cost.

Why

Concrete—Of special hard aggregate granite mixture—cured under ideal conditions—mixed and finished by skilled and trained mechanics.



Cut-away View of 3-Way Armored Glass, Showing Shield Embedded in Concrete

Glass—Is armored by a heavy cast iron shield. Hot galvanized treated. Glass is sealed under special heat treatment with pure tar and sulphur compound in this shield, thus overcoming the detriments to glass from expansion pressure.

Glass is Flintex-Lazalite quality free from internal stresses, each piece having passed polariscope test. Is made from special mixture for this purpose only.

Instant Replacement of Glass—Should it become necessary to replace a glass unit, replacement can be made in a moment's time by any help about the building. No special skill required. This means sidewalk lights can be kept in perpetual good condition at practically no maintenance cost.

5-year glass guarantee.

Watertight—Compounds which we use for waterproofing are prepared specially for this purpose and are of the highest grade and quality for additional insurance against any leakage. When drawing plans and writing specifications, see detail on second following page.

3-Way Armored Sidewalk Lights

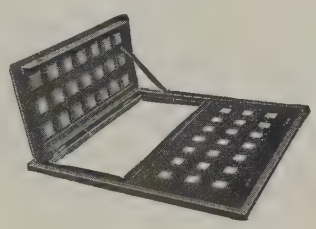
Specifications—Sidewalk Lights as shown on plans shall be of 3-Way Armored Glass Construction, Flintex-Lazalite Glass units sealed in galvanized cast iron shields, embedded in reinforced concrete construction.

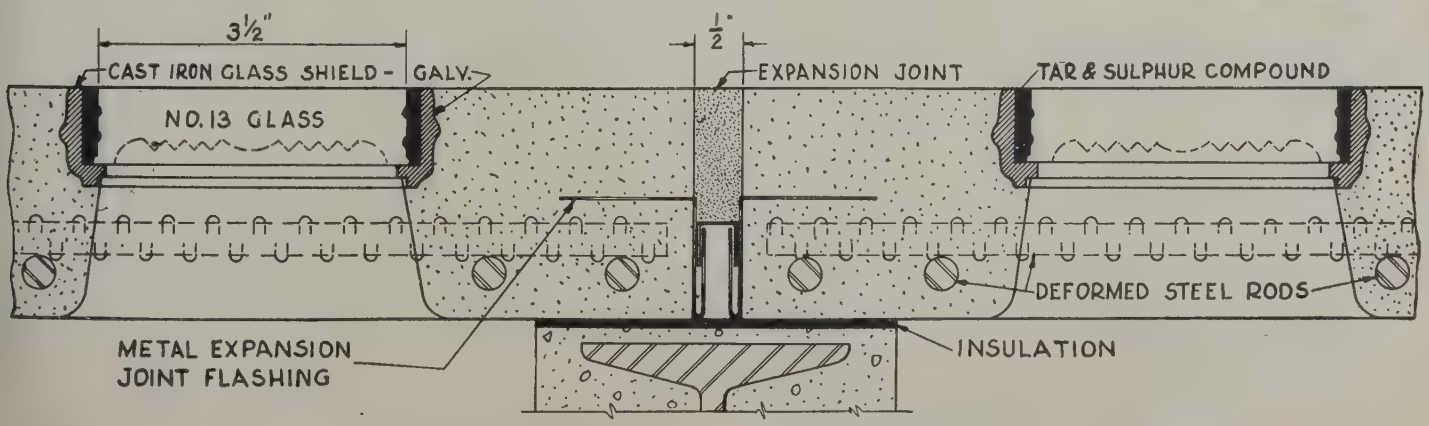
Glass shall be No. 13A (3½ in. square Fresnel lens in 4-in. galvanized cast iron shields spaced 5 in. centers), or No. 12 (2¾-in. round sunburst lens in 3-in. galvanized cast iron shields spaced 4¼ in. centers). Glass for replacement to be supplied free of charge f.o.b. factory for period of 5 years.

(Can be furnished in factory finished slabs) or (Installed complete by manufacturer).

Sidewalk Doors

3-Way Type "C" Watertight Sidewalk Door. Channel frame, tapped for drain connection, heavy bronze hinges, flush top, quality door. Hand lift or equipped for elevator lift.





Section 3-Way Armored Glass Sidewalk Lights Showing Waterproof Intermediate Joint

3-Way Daylight Roofing (Glass Guaranteed for 5 Years)

Construction—A roof light construction without equal. Gives abundance of light, is fireproof, burglar-proof, weatherproof (see details following page). Easily cleaned. Can be walked upon with safety. Designed and constructed for permanence and to eliminate maintenance costs.

A roof light that harmonizes with the architectural lines of the modern structure.

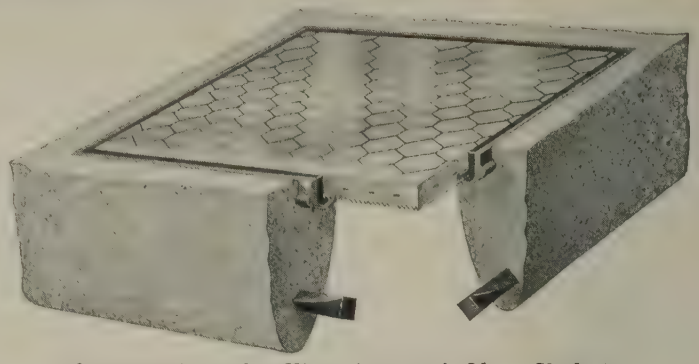
Glass is 8¼ in. square, standard ½ in. wired glass units, 9⅝ in. centers, sealed under special heat treatment with tar and sulphur into heavy cast iron hot galvanized treated shields, protecting the glass from expansion pressure and at the same time permitting easy and instant replacement without skilled help at any time it should be necessary.

Construction has a thickness of 3⅜ in. Weight approximately 30 lb. per sq. ft. (See details following page.)

Can be furnished in factory finished slabs.

We recommend installation at building with our own mechanics.

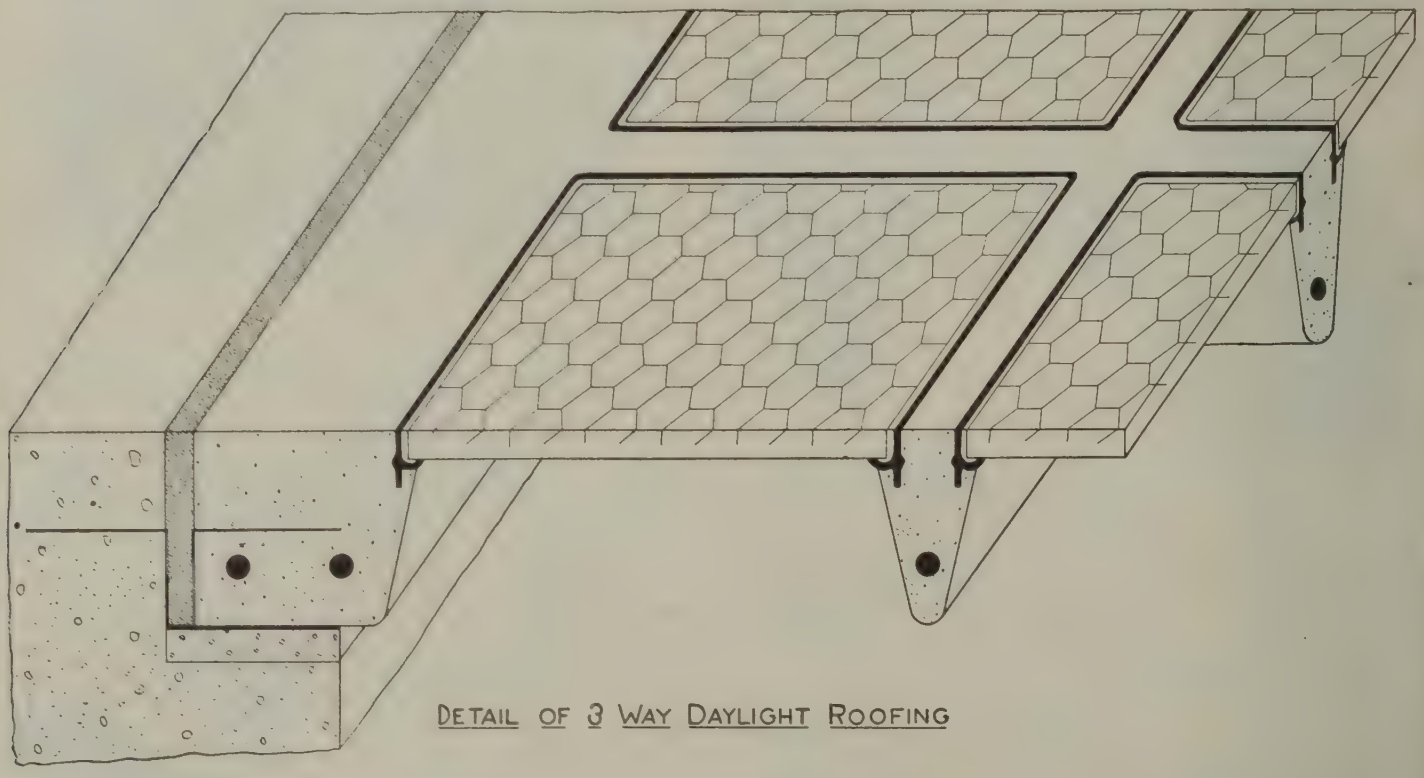
Specifications—Roof Lights where shown to be 3-Way Daylight Roofing Construction, 8¼ in. wire glass units of standard ½ in. wired glass, sealed in cast iron galvanized shields 9⅝ in. centers. Reinforced concrete construction; flashed as shown on plans (set up on curbs as shown on plans); installed complete by manufacturer.



Construction of 3-Way Armored Glass Skylight

Glass for Replacement—To be supplied free of charge f.o.b. factory for a period of 5 years.

Use 3-Way Caulking Compound for filler in all joints.



DETAIL OF 3 WAY DAYLIGHT ROOFING

Floor Lights

To light corridors, first floors, and the like, can be furnished and finished in color to match.

Glass either 4 in. square Fresnel design, 4¾ in. centers, or 6⅛ in. square, set 7½ in. centers.

Thickness of construction 2½ in.

Weight, approximately, 25 lb. per sq. ft.

P. M. BRUNER GRANITOID CO.

ESTABLISHED 1878

Sidewalk Lights, Floor Lights, Skylights

523-524 Frisco Building

ST. LOUIS, MO.

Bruner Construction

Bruner sidewalk lights, floor lights and skylights conform to recommendations adopted by United States Department of Commerce, Division of Simplified Practice, as per bulletin No. 49.

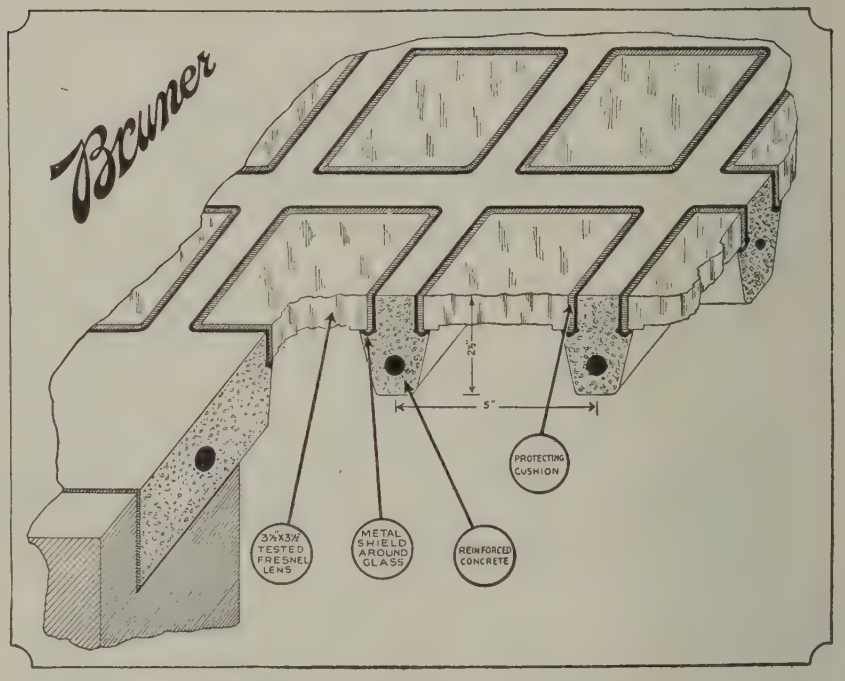
Standard Sidewalk Light Construction

In this construction there can be no leakage and no breakage of glass from structural or expansion stresses. Glass broken from accident or abuse can easily be repaired without disfiguring the construction in any way.

Specifications—The sidewalk lights shown on plan shall be of two-way reinforced concrete rib construction as shown in P. M. Bruner Granitoid Co.'s Standard Sidewalk Light Bulletin, capable of carrying safe live load of 300 lb. per sq. ft. The glass to be 3½ in. square by ¾ in. thick at supporting edge, set in 4-in. square metal shields with elastic compound. The lenses shall be set 5 in. on center. The ribs shall be 2½ in. deep.

Bearing furnished for this construction should be 3 in. wide by 2¾ in. deep.

The entire construction to be guaranteed waterproof and free of defects for a period of one year. Replacement glass to be furnished free f.o.b. factory for 5 years.



Standard Sidewalk Light Construction

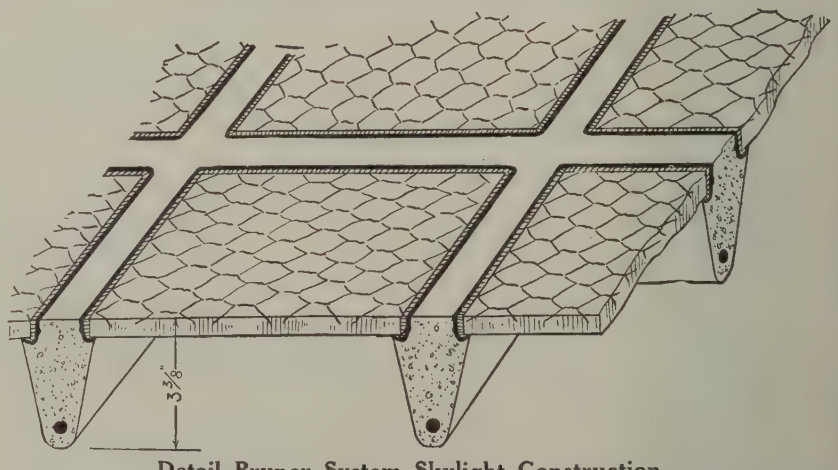
Bruner Skylight Construction (Trade Name, "Daylight Roofing")

We recommend that concrete curbs be formed as part of the reinforced concrete roof. Bruner reinforced concrete skylights being laid over these curbs and projecting beyond with drip formed on under side (as shown), a permanently mechanical watertight job is assured.

Where required, however, this skylight construction can be made flush with roof by setting same in rabbet formed in reinforced concrete and calking with our special waterproof compound.

Specifications—The skylights shown on plan shall be of two-way reinforced concrete rib construction as shown in P. M. Bruner Granitoid Co.'s Skylight Bulletin. Glass to be ribbed wire 8¼ in. square, set in metal shields with elastic compound. Ribs shall be 3½ in. deep, set 9¾ in. on centers both ways. The entire construction is to be guaranteed for one year, and replacement glass is to be furnished free of charge for a period of five years.

[Plans should show detail of bearing furnished.]



Detail Bruner System Skylight Construction

Spans up to 10 ft. can be made without intermediate beams. Standard construction beams are on 9¾-in. centers. Standard wire glass is 8¼x8¼ in. The metal shield and protecting cushion construction is similar to that in the Bruner sidewalk lights

Broad Flexible Service

Bruner sidewalk lights, floor lights and skylights can be constructed in place, or made in panels at our factory and shipped anywhere.

We are at all times ready to give information, make details, or quote prices on our construction.

Products

TRANSPARENT ROOFING.
RAY-PLACEABLE SIDEWALK LIGHTS.
Also Watertight Vault Light and Checkered Steel Sidewalk Doors; Safety Coalhole Covers, Ventilating Gratings and Calking and Waterproofing Compounds.

Our products are all in accordance with the Division of Simplified Practice, Recommendation No. 49, United States Department of Commerce, Washington, D. C.

Transparent Roofing No. 880

Transparent Roofing No. 880 is a Government standardized product of double reinforced concrete with shield protected, insulated ribbed wire glass units.

The tar and sulphur cushion between the glass, together with the galvanized iron shield, protect it from expansion and contraction of the concrete and make easy replaceability a feature, should the glass become broken by abuse.

Being burglar, fire and weather proof, its many uses are obvious where long life and practicability are desired.

Many notable installations have been made in roofs of rear extensions, porches, marquises, garages, hospitals, comfort stations and mausoleums.

Strength—Forty pounds to the square foot with a factor of safety of four on a nine-foot span.

Glass Area—Seventy per cent glass area in a panel nine by nine feet.

Specifications—Where shown on plans, furnish and set Transparent Roofing (as manufactured by DAVIS CARPENTER & CO., INC., New York, N. Y.) using standard 8¼-in. square ½-in. thick wired glass units, each sealed with tar and sulphur compound in a galvanized cast iron shield. Glass units are to be set 9⅝ in. on centers and embedded in a 3⅜ in. thick concrete slab, reinforced longitudinally and transversely with steel rods between each glass.

Expansion joints are to be formed at proper intervals and thoroughly calked. Glass for replacements to be supplied free of charge f.o.b. plant for a period of five years.

Weight Test on Transparent Roofing Slab Clear Span 9x9 Ft. Total Load—6075 Lb.

Ray-Placeable Sidewalk Lights No. 440 and No. 100

Our sidewalk light constructions have similar features to the No. 880 but are designed with the required increase in strength for greater loading.

A 3½-in. *square glass,* No. 440 of Lazalite Flintex quality with a Fresnel lens, designed to spread the light rays, spaced on 5-in. centers, and a 2¾-in. *round glass,* No. 100, of the same quality with a sunburst pattern, spaced on 4¼-in. centers, are also furnished in a shield protected, insulated type of construction.

We make up our various types of construction in *factory finished ready-to-set slabs* where customers desire to make their own installation.

Specifications—Where shown on plans, furnish and set 3½-in. square glass, No. 440 (as manufactured by DAVIS CARPENTER & CO., INC., New York, N. Y.) using 3½-in. square Fresnel Flintex-Lazalite lens, polariscope tested, sealed with tar and sulphur compound in galvanized cast iron shields. Lenses are to be spaced 5 in. on centers and embedded in a concrete slab $2\frac{9}{16}$ in. thick reinforced longitudinally and transversely with steel rods between each glass.

Expansion joints are to be formed at proper intervals and thoroughly calked. Glass for replacements to be supplied free of charge f.o.b. plant for a period of five years.

Products

Grauer Reinforced Concrete Sidewalk Lights, Skylights, Floor Lights, and Marquise Lights; for all classes of buildings, tunnels, subways, train sheds, canopies, etc., installed in place or shipped in slabs ready to set.

Also manufacturers of Grauer Cement Floor Finish; Rubber, Linoleum and Cork Tile Floors, Composition Floors, Illuminating Sidewalk Doors, Coalhole Covers and Rings, Sidewalk Ventilators, Bullseye Glasses of every size for repairing sidewalk lights and skylights of any style or manufacture.

For Grauer-Watkins Red Asphalt Floor, Style-Tile Floors and Borders and Graustic Floor, see pages B1980-1982.

Advanced Design

Grauer daylighting installations for all purposes are built on a scientifically correct design which makes them positively proof against any conditions of weather or use. Accident or excessive abuse only can break them.

New type Grauer Shield Protected Lights eliminate repairs. Plastic cushions (non-leakable) around the glasses protect them from shaling and breakage due to expansion of surrounding concrete.

Grauer
Skylights
Floor Lights
Sidewalk Lights
Graustic Floors
Red Asphalt Floors

With Grauer daylighting equipment, you can give buildings the great convenience and profitable investment of daylighting throughout, with assured permanent durability. When breakage does occurs, due to accident, new glasses are easily installed by unskilled labor at a trifling cost, and without showing the repair.

Fully Guaranteed

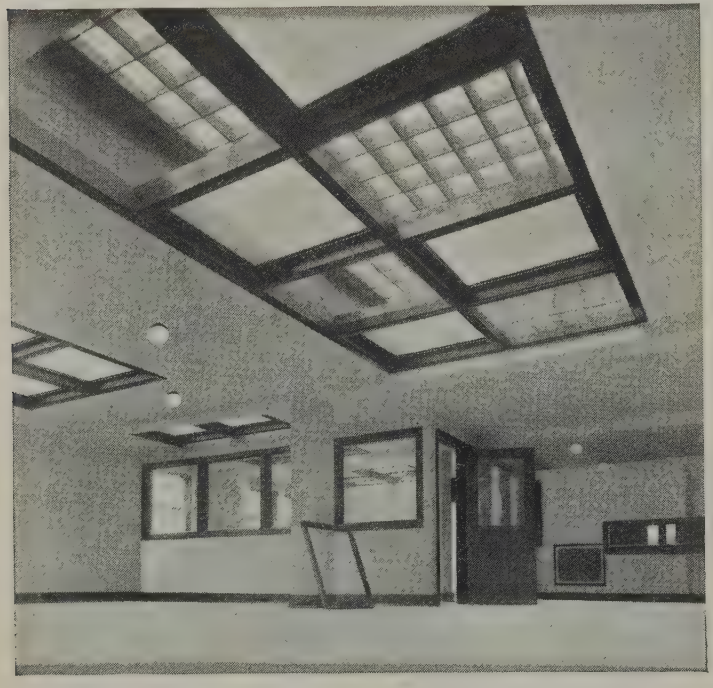
Grauer Shield Protected Sidewalk Lights are unconditionally guaranteed for one year, to be rustproof, leakproof, and free from defect. Replacement glasses will be supplied free f.o.b. factory for five years.

Sidewalk Lights

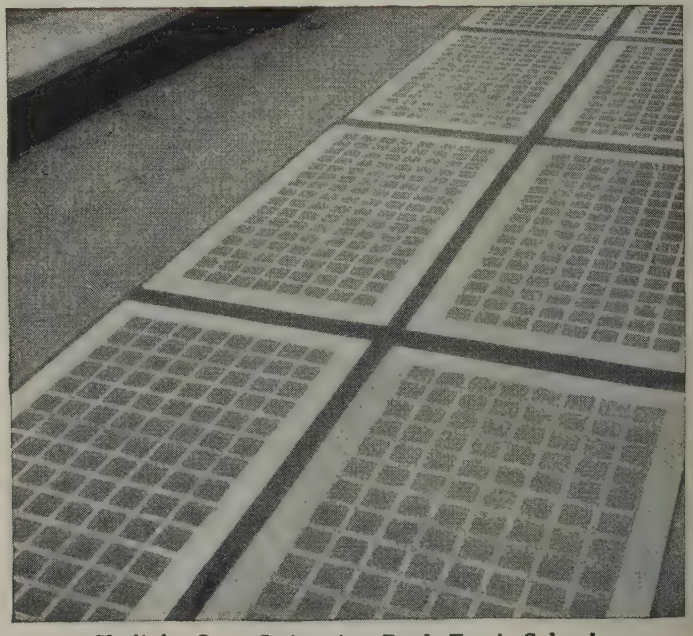
The diagrams on following page, illustrate the construction of Grauer Shield Protected Sidewalk Lights. This construction carries a load of 300 lb. per sq. ft. and can be built to carry 1000 lb.

Glass—The best quality of glass (Grauer No. 20) is used, and guaranteed to be properly annealed, each glass having passed polariscope test.

Economy—The saving in electric current alone will pay for Grauer Shield Protected Sidewalk Lights in a short time, usually in one and a half years, the time depending on current rate. The added efficiency of employees or tenants using the basement, their health, comfort, and pleasant working condi-



Skylights Over Restaurant, Nolan School, Detroit, Mich.



Skylight Over Swimming Pool, Ferris School, Highland Park, Mich.

Continued on next page

tions, pay many-fold for the daylight provided. Where basement spaces are daylighted, and used as salesrooms, the increased revenue frequently pays for the entire cost of construction in *less* than one year.

Ready-to-set-Sidewalk Slabs—Completely built slabs can be supplied on order, to fit specified spaces, when for any reason it is not desired to have our own skilled workmen install daylighting construction.

Specifications—The sidewalk lights shown on plans shall be constructed with carrying members of reinforced concrete. The glass shall be Grauer No. 20, set in rustproofed metal shields with an elastic compound. The design to permit glass replacement with unskilled labor. All glass is to be polariscope tested and guaranteed free of internal strains. The construction shall be capable of carrying a uniformly distributed live load of 300 lb. per sq. ft. without injury.

The entire construction is to be guaranteed waterproof and free of defects for a period of one year. Replacement glass to be furnished free, f.o.b. factory for five years.

Floor Lights

Floor lights permit the daylight to do double duty. Light thus admitted to a lower floor, even though diffused through one story, comes from above and is more efficient than light from side windows.

The construction is similar to that of Grauer Sidewalk Lights. The glass is, however, set directly in concrete as the extra expense of shields is unnecessary in interior installations.

Grauer Floor Lights maintain more weight than an ordinary floor will hold. They are permanently watertight, proof against rust and fire, require no upkeep expense.

The concrete carrying ribs are 3½ in. in depth and on 6-in. centers both ways. The two styles of glasses are 4¾ in. square by ¾ in. thick. No. 89 is plain flat; No. 88 is diffusing and ornamental.

Specifications—The floor lights shown on plans shall be constructed of reinforced concrete and glass according to the Grauer System; installed complete in place by the manufacturer's own workmen. The glass shall be diffusing glass No. 88 [plain glass No. 89] 4¾ in. square, guaranteed free of strain by polariscope test. Spans up to 8 ft. are to be made without intermediate beams, with a guaranteed safe live load of 250 lb. per sq. ft., with a factor of safety of 4.

The floor lights are not to be installed until after the surrounding floors have been laid complete. The floor light manufacturer is to provide an elastic, waterproof expansion joint of approved materials on the four sides of each opening.

The construction and glass is to be guaranteed for a period of one year, and any defects appearing within this period are to be promptly corrected to the satisfaction and without cost to the owner.

Skylights

Grauer Skylights with wire glass set in metal shields supported by a reinforced concrete grill, represent the greatest advance in skylight construction in years. Glass is protected from pressure, both structural and expansion. These skylights defy all weather conditions and are unconditionally guaranteed. If broken by smashing (the only way they can be broken) replacement is easy by unskilled labor.

Grauer Skylights may be walked on. They give large light area; are permanently watertight and proof against rust, fire and burglars. The upkeep expense is negligible.

Specifications—The skylights shown on plans shall have structural members of reinforced concrete, supporting permanent metal shields in which glass is set. Metal shields are to be rustproofed. Glass to be ribbed wire 8¼ in. square, ½ in. thick, set in an elastic, watertight compound. Spans are to be made without intermediate beams up to 9 ft. clear. The entire construction is to be guaranteed for a period of one year and replacement glass is to be furnished free of charge for a period of five years.

Marquise Lights

The Grauer Skylight construction is admirably suited for use in marquises, and is now being generally utilized for this purpose. Architects, builders and building owners who have had trouble with the constant breaking of the ordinary sheet glass formerly used in marquise work, have come to realize the economy and satisfaction of permanently meeting this problem in the first construction. The Grauer System is a most durable product adaptable to work of this character.

National Service

This organization is equipped to install Grauer Shield Protected Daylights in any building anywhere. Skilled crews are placed in charge of each installation. Our experience of 22 years in the design and construction of daylighting equipment, assures scientifically correct installation and permanent satisfaction.

Illustrated bulletins on lights for all uses, quotations and information, will be supplied promptly.

J. MERRILL RICHARDS

Manufacturer of Sidewalk Lights, Glass Roofs and Transparent Roofing

119-122 West First Street
BOSTON, MASS.

Products

RICHARDS' "UNITY" PERMANENT SIDEWALK LIGHTS and GLASS ROOFS, Standardized Constructions.

For Magnalite Obscuring Glass, see page B2176.

Shield Protected Glass Constructions

Sidewalk Lights—Double reinforced concrete and glass construction, with glass set into hot-dip galvanized cast iron protecting shields with elastic material. 2¾-in. diameter round, and 3½-in. square glass units.

Glass Roofs—8¼-in. square, ½-in. thick glass set into hot-dip galvanized shield with elastic material. Glass roofs are effective in barrel arches as shown below. They can be installed on flat pitch in interior courts or on roof to keep skylight off the skyline.

Advantages of Shield Constructions

Shields protect the glass from all compression in the top of the slab, eliminating glass breakage.

Glass broken by accident can be replaced in a moment's time by unskilled labor, making no unsightly repair patch. There is no leakage. Permanency.

Five-year glass guarantee.

Specifications for Shield Constructions

Sidewalk Light—Shall be Richards' "Unity" Construction using (2¾-in. round or 3½-in. square glass) set into hot-dipped galvanized cast iron shields with elastic compound.

Glass Roofs—Shall be Richards' "Unity" Construction with 8¼-in. square ½-in. thick glass set into hot-dipped galvanized cast iron shields with elastic compound.

Guarantee

This contractor shall furnish written *guarantee* to maintain the construction against faulty materials and workmanship and any leakage caused by such for a period of one year.

Glass for replacement shall be furnished owner, free of cost f.o.b. factory, over a period of five (5) years for units broken by any cause outside of fire.

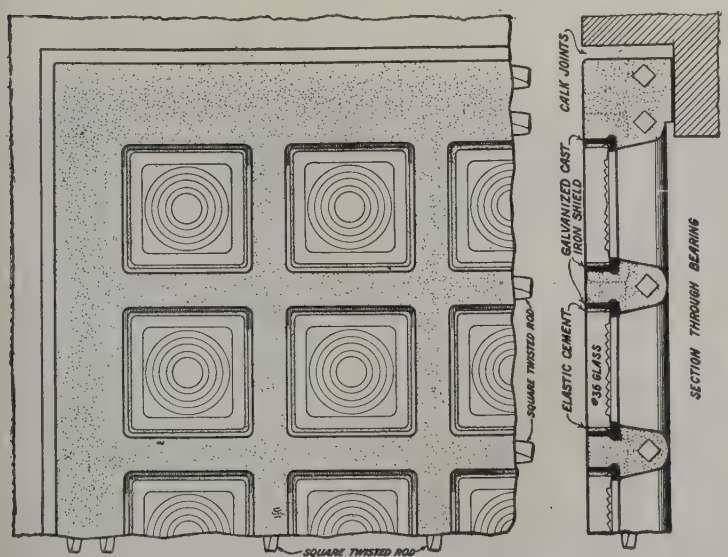
Details Construction of Reinforced Concrete Sidewalk Lights



Detail Showing Galvanized Cast Iron Shield Protected Glass

Glass

For Sidewalk Lights—3½x3½ in. in *galvanized cast iron shields;* 3-in. diameter in *galvanized cast iron shields.*

For Floor Lights—3½x3½ in. in *galvanized cast iron shields;* 4x4 in. and 6⅛x6⅛ in. without shields.

For Roof Lights—8¼x8¼ in. wire glass set in *galvanized cast iron shields.*

Guarantee—We will furnish free of charge f.o.b. our factory any glass broken in our *galvanized cast iron shield* type construction for a period of five years from date of installation, unless breakage is caused by fire or misuse.

Cast Iron Sidewalk Lights

We have discontinued furnishing cast iron sidewalk lights for new installations, but have patterns and glass for repairs and replacements.

Glass—For concrete setting 2, 2½ and 3-in. diameters, 3 in. square, 2½x3½ in. and 2¼x5 in.

For sulphur setting 1⅝-in. diameter.

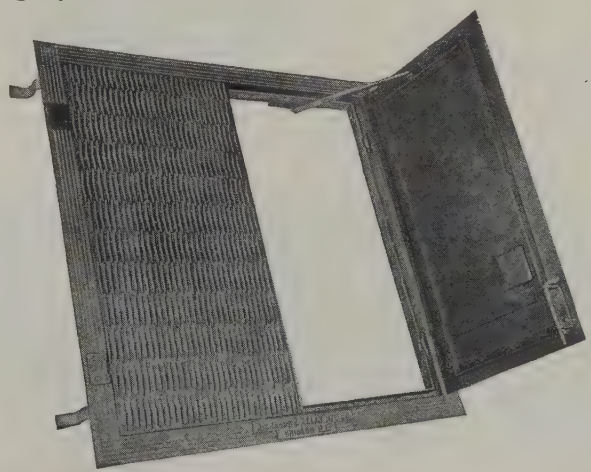
Sidewalk Doors

Manufactured in flush or raised types with checkered steel plate door leaves.

Illuminating doors made in either flush or raised type with 3 in. square glass set in checkered steel plate door leaves.

All doors are fitted with brass hinges, device to hold doors while open, slide bolt to lock from below and anchors to build into concrete. Door leaves can be fitted with striker plates if doors are operated with arch on car platform.

Flush type door frames made either of one piece iron castings or welded steel channel frames with gutter tapped for ¾ in. pipe to carry off water which seeps through joints between doors and frames.



Flush Type Checkered Steel Sidewalk Door

Coalhole Covers and Frames

Sidewalk Type Stock Sizes—16, 18, 20, 24 and 30 in., with or without glass. Special sizes 26, 28 and 36 in.

Driveway Type Stock Sizes—20, 24 and 30-in. diameter; 20x20, 24x24 and 30x30 in.

Quotations and Details

Ventilators

TELEPHONE
LAFAYETTE 1862, 1863

3324-3354 South Artesian Avenue
CHICAGO, ILL.

Products

DICKINSON CAST IRON FLOOR VENTS, MUSHROOM TYPE; "ÆOLUS" ROOF VENTILATORS.

For Dickinson Cast Iron Exhaust Heads and Dickinson Cast Iron Scuppers, see page A697.

Dickinson Cast Iron Floor Vents (Mushroom)

Oval Type—Standard size—8x12 in. Cap size—11¾x15¾ in. Squared floor size—6, 8 and 10 in. Maximum height—at full capacity 3½ in. from floor.

Round Type—Standard sizes—6, 8, 9 and 10 in.

The floor section may be had with or without means for bolting to the floor.

The caps are easily and fully adjustable, and the only tool needed is a screwdriver, the nuts being held firmly in slots.

E-Z Damper Griptite Mushrooms

Standard sizes—6, 8, 9 and 10 in. round and also 8x12 in. square floor.

The advantages of this method of controlling air are evident, as the space between the damper and cap acts as an expansion chamber, reducing the velocity of air before leaving the mushroom instead of at the time of leaving.

Installation of 185 24-in. "Æolus" Ventilators

AKRAT VENTILATORS, INC.

Ventilating Engineers
1180 Builders Building
CHICAGO, ILL.

FACTORY AND WAREHOUSE
CHICAGO, ILL.

"Akrat" (Accurate) Siphonage Roof Ventilator

All that a roof ventilator should be. Simple in design—accurate in detail—efficient in exhaust capacity. Their neat appearance insures a graceful skyline wherever installed.

Design—The design is scientifically correct, as the slightest air currents coming in contact with any portion of the ventilator creates a siphonage action which greatly increases the volume of the exhaust.

Akrat Siphonage Ventilator

Uses

Akrat Ventilators should be installed to exhaust foul air, smoke, dust, fumes, gases, steam, etc., from all types of buildings: also to create a constant circulation of air by gravity ventilation. When the installation has been completed, they require no further attention and their powerful exhaust capacity can be utilized twenty-four hours of each day.

Features

The table of comparative dimensions indicates that the over-all height is very low in comparison to the diameter of the various sizes. This feature was developed by our engineers *at no sacrifice in exhaust capacity.*

Another feature is that the ventilators do not detract from the appearance of the buildings on which they are used.

To facilitate the erection of the larger sizes, Akrat Siphonage Ventilators are assembled in two sections. These two sections are fastened together with brass bolts, nuts and washers. The upper section, which consists of the top and weather-band, is securely riveted together with heavy bars of material. The lower section consists of the eduction pipe with siphons riveted solidly thereon. The top section can be removed easily by taking out the brass bolts. This is of importance when it becomes necessary to paint the ventilators after they have been installed. All joints of these ventilators are securely riveted—absolutely no solder being used in their assembly.

Material

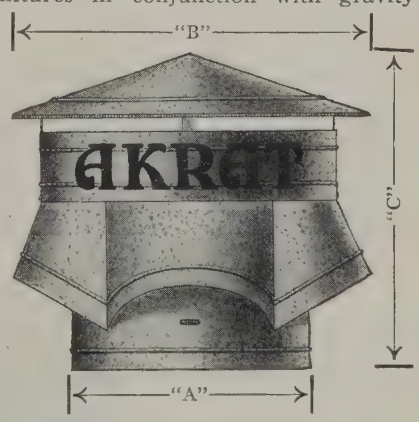
Fabricated from prime galvanized sheets; also of keystone copper-steel, armco ingot iron, toncan metal, cold rolled copper, zinc, aluminum, monel metal, or any other sheet metal. Our standard gauges are adequate for the various sizes. Braces and reinforcements are of galvanized material. When ventilators are made of special metal, the braces will be made of the same material from which the ventilator is fabricated.

Engineering Service

To obtain the greatest exhaust possible, many important elements, such as prevailing conditions to be remedied, temperature differences both inside and outside, humidity, location of ventilators, type of bases used, height above roof parapets or surrounding obstructions, etc., must be considered before specifying any particular size or quantity of ventilators.

Canneries, dye works, paper mills, etc., require special aprons, hoods or fixtures in conjunction with gravity ventilators.

We are prepared to furnish such equipment and our Engineering Department will gladly cooperate with architects and engineers who desire to obtain data and information regarding such installations.



Capacities

These capacities are compiled from tests that were conducted at the Armour Institute of Technology, Chicago, Ill.

Product

AMERICAN-LARSON SUCTION VENTILATORS (Patented 1927).

The Principles of Static Ventilation

Two distinct sets of forces produce natural air currents in ventilators. These forces are stack action, and wind action.

Stack action occurs when air in a stack is heated above the temperature of the surrounding atmosphere. This action is independent of wind velocity, and ceases when the temperatures inside and outside of the stack are equalized.

Wind action is not so simple, and its effects follow different laws at different wind velocities.

In the flow of fluids in pipes, ducts, etc., it is found that there are two critical velocities. Below the lower critical velocity, the fluid moves in parallel lines, and pressure drop is due to viscosity only. Above the upper critical velocity, the fluid moves in a turbulent manner, and pressure drop grows as the square of the velocity. Between the upper and the lower critical velocities, the motion of the fluid is unstable, and vacillates between one or the other states of motion, depending upon small irregularities and accidental happenings.

Design of High Efficiency Ventilators

The air moving force due to stack action or buoyancy is

$$h_1 = 39.7\ H\left[\frac{1}{t_o + 460} - \frac{1}{t_1 + 460}\right] \times \frac{B}{30}$$

or very closely,

$$h_1 = \frac{H\ (t_1 - t_o)\ B}{206{,}000}$$

in pounds per square foot, where H is the height of the column of warm air in the building at temperature t_1; t_o is the temperature of the outside air, and B is the height of the barometer in inches of mercury. This force is the same for all types of ventilator.

The other air-moving force, the suction produced by the action of the wind on the ventilator, has as its upper limit of possibility the full-impact pressure of the wind, or

$$h_2\ (\text{limit}) = \frac{v^2.\ B}{12000}$$ pounds per sq. ft., where v is wind velocity in miles per hour. This ultimate value can never be reached, because the full impact of the wind cannot be utilized. In the ordinary cowl type of ventilator and in most stationary ventilators, the suction is produced only by viscous drag and not by impact, and for these it is only about 30% of the full-impact. In the improved American-Larson Ventilator, due to the efficient utilization of the impact of part of the wind stream, the suction attains the high value of 50% of the full-impact pressure difference, and, to the best of our knowledge, this figure has never been exceeded or equalled. The force produced by the action of the wind on the ventilator then is

$$h_2 = \frac{v^2.\ B}{24000}$$

Furthermore, the suction is produced at all wind velocities, even the lowest—whereas for the other types the suction drops rapidly, and finally disappears altogether below 3 miles per hour, as is evidenced by the curves of test results at the right.

If these two air-moving forces could be added together, the velocity of discharge which they would produce, in feet per second (barometer 30 in. Hg. standard) would be

$$v' = 29.1\sqrt{\frac{H\ (t_1 - t_o)}{6870} + \frac{v^2}{800}}$$

and the air discharged per square inch of cross section of the throat, if the ventilator had 100% coefficient of discharge, would be

$$Q \text{ cu. ft./hr.} = 728\sqrt{\frac{H\ (t_1 - t_o)}{6870} + \frac{v^2}{800}}$$

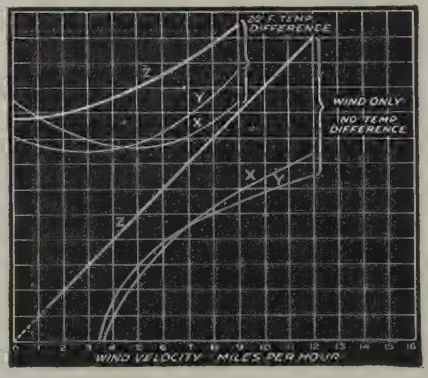
No air-discharging device, however, can have 100% coefficient because there is always some contraction of the air stream entering the throat, and some friction against the sides; furthermore, in any ventilator head, the air must change its direction from vertical to horizontal, which causes some added resistance. These effects are unavoidable, but in the American-Larson they are reduced to the minimum; the conical inlet to the throat reduces the contraction, and the air is required to make only one easy turn of less than 90°. The discharge coefficient therefore reaches the high value of 70% for this ventilator, as compared to 50% or less in some designs where the air is compelled to make a number of turns before it can leave the ventilator head. The discharge would therefore be

$$Q = 510\sqrt{\frac{H\ (t_1 - t_o)}{6870} + \frac{v^2}{800}}$$

cubic feet per hour for each square inch of throat area in the American-Larson ventilator.

It is evident from these figures that not only has the American-Larson a much higher capacity than other types of ventilator, but that in the improved form it approaches closely to the highest limit of what is physically possible in an ideal ventilator.

In the practical ventilator, the two forces do not add directly, and there are other modifying conditions such as the influence of wind pressure on the building, which make it preferable to use, in calculation of capacities, the American-Larson formula given in a paragraph below.



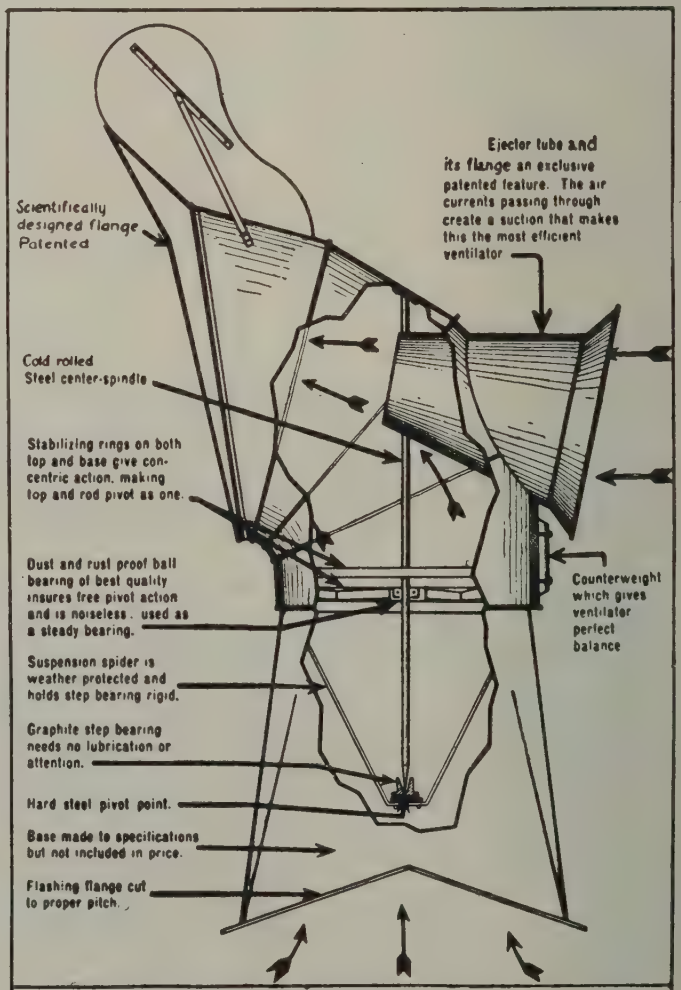
Graphic Record of Comparative Tests by Professor Trinks at Carnegie Institute of Technology

X = 18-in. stationary siphon ventilator
Y = 18-in. rotary siphon ventilator
Z = 18-in. American-Larson suction ventilator

The Practical Design of Ventilators

The practical designer of ventilators endeavors to combine the greatest possible draft, with the least possible resistance to air flow. He must accomplish this at extremely low wind velocities. The action at low wind velocities must be quite independent of temperature differences. Under no conditions must the design be subject to interference by back-drafts.

Unless proper provisions are incorporated in the design these features are very hard to combine. In the American-Larson Ventilator however, the patented ejector tube effects air movement in direct ratio to wind velocities and temperature dif-



Cut View of Typical American-Larson Ventilator

Continued on next page

ferences. When there is no temperature difference many ventilators do not function at all unless wind velocity is greater than 3½ miles per hour; furthermore under temperature differences as great as 20° F., the efficiency of such ventilators actually decreases in gentle breeze up to 4 or 5 miles per hour velocity.

In the American-Larson the kinetic energy of the wind is used to the maximum possible extent, by creating suction, due to the viscous drag both inside and outside the cowl.

On account of the easy or gradual turn of the air current and the unobstructed discharge area, the discharge for a given pressure drop in the American-Larson is unusually high —about 75% of that through a rounded opening of the same area.

In the stationary type of ventilator the great number of turns of direction of the air causes excessive resistance or pressure drop. To avoid this the proportions of the passage have in some designs been made excessively large in order to reduce air velocities, but these large passages mean that the ventilator is not properly shielded and that down-draft is an ever present source of trouble in high winds, so one or the other feature (freedom from downdraft or low pressure drop) which ever is considered of least importance must be sacrificed. This condition is particularly unsatisfactory when snow is falling with relative humidities around 96 to 98%.

Static Draft

The static draft produced by the wind action on the ventilator is equal to h_2. Expressed in inches of water, it is

$$\text{Draft} = \frac{v^2}{4160}$$

v being wind velocity in miles per hour. This value, which is very high for natural ventilation, applies only to the improved American-Larson Ventilator, and is attained by the combination of ejector tube and flanges developed through extensive and scientifically planned experimentation.

This is the static draft produced by the wind action only. Where there is a temperature difference, the total static draft is the sum of h_2 plus h_1 as given in the paragraph on design of high efficiency ventilators.

Solution of a Typical Ventilation Problem

A given building is 44x110x28 ft. average height and will be used to house equipment and appliances which will throw off approximately 416 lb. of steam per hour.

The ventilator capacity to be figured on the following conditions: 10 changes of air per hour; temperature difference, 20° F.; wind velocity, 5 miles per hour; ventilators 36 ft. above the floor level. The heating system will be adequate.

In summer the proper ventilating requirements will be a question of providing sufficiently rapid flow of air into the building to (a) absorb a large part of the water vapor, and (b) produce sufficient upward velocity of air flow to carry upward the minute globules of water which compose visible steam. The temperature difference between air inside and outside the building in summer is usually small, but the building is wide open. Under these conditions the problem is simply that of providing sufficient ventilator capacity.

In winter, while the same requirements are to be met as in (a) and (b) above, the temperature difference is great and the wind velocity usually high; since the building must be kept at a reasonable temperature, the air inflow will naturally be restricted by closing doors and windows. It is evident that the ventilation conditions in winter do not depend entirely upon the number or size of ventilators installed, but on the capacity of the heating system and the amount of heat given off by the equipment and appliances in the building.

Another item which must be considered is that of condensation and dripping of water from the roof. This is rather a question of roof construction than one of ventilation. If the roof is unprotected sheet iron, and if the building is kept at a rather high temperature in winter, with very restricted air inflow, condensation on the under surface of the roof will inevitably occur. On the other hand, with a roof laid on wood or protected with insulation, if a reasonably large air inflow is permitted, condensation will not occur.

Considering all of these features it would appear proper to install the ventilator capacity required under summer conditions.

Calculation of Capacity—The volume of air moved per hour by a ventilator or set of ventilators can be derived from the following American-Larson Ventilator capacity formula,

$$Q = A\left[\frac{36\sqrt{H\,(t_1 - t_0)}}{6 + v} + 20 \times v\right]$$

where Q = cu. ft. of air exhausted per hour; A = throat area of ventilators in sq. in.; H = center of ventilator outlet to floor; v = (wind velocity) miles per hour; t_1 = inside, and t_0 outside average temperatures.

In solving; $Q = 10\ (44 \times 110 \times 28) = 1{,}357{,}000$ cu. ft. per hour ventilating capacity, whence, from the formula, $A = 7200$ sq. in.

Seven 36-in. American-Larson Ventilators have an area of 7150 sq. in.
Six 40-in. American-Larson Ventilators have an area of 7540 sq. in.
Four 48-in. American-Larson Ventilators have an area of 7220 sq. in.

Actually, the results given by the formula are very conservative and the last term of the equation should be multiplied by the factor of 140% which would, with any of the three combinations figured on, give a capacity of 12 changes per hour instead of 10. The lower figure has been used, however, to allow a greater "factor of safety." And since the average wind velocity for the vicinity in which the building is located is shown by the U. S. Weather Bureau reports to be about 12 miles per hour, the ventilating capacity at most times would be considerably greater. It is best, however, to provide for the least favorable conditions.

Moisture Absorption—(A) Moisture content of air 70°, 75% relative humidity = .00086 lb. cu. ft.

If raised to 90° F. and saturated, moisture content = .00213.

Moisture absorbed per cu. ft. = .00213 — .00086 = .00127.

Moisture absorbed by 10 changes of air per hour = .00127 × 1,257,000 = 1720 lb. per hour.

Steam given off by the equipment and appliances = 416 lb. per hour, or only 24% of what could be absorbed.

(B) If air is not heated at all, but absorbs all of the steam given off by the equipment and appliances, $\frac{416}{1{,}357{,}000} = .00030$ lb. per cu. ft. = increase in moisture.

This corresponds to a relative humidity of 100%—that is to say, the air at 70° F. could absorb all of the steam without becoming over saturated.

Recommendations—The combined throat area of all ventilators should be approximately 7000 sq. in. This is equivalent to seven 36-in. ventilators, or six 40-in., or four 48-in. of the American-Larson type.

The location of the ventilators or the best number to use, will depend largely upon the number of bays of the building, since it is generally preferable, although not essential, to locate each ventilator at the center of a bay (i.e., midway between the roof trusses).

Suggested Form of Specification

(1) All ventilators shall be American-Larson Suction Ventilators, as manufactured by the American-Larson Ventilating Company, of Pittsburgh, Pa., and shall [shall not] be equipped with dampers.

(2) The ventilators shall be made of *(see Note 1)* and shall be of the following gauges:

Below 18-in. diam., No. 24 gauge; 20 to 24-in. diam., No. 22 gauge; 30 to 48-in. diam., No. 20 gauge; 54-in. diam., No. 18 gauge.

(3) Where so indicated, the ventilators shall be mounted on extension piping of sufficient height to raise ventilators above surrounding obstruction.

(4) The ventilators shall be erected plumb and in a substantial manner. Where extension pipes are used they shall be anchored to four points with heavy gauge guy wires.

(5) Ventilators for ———— shall be equipped with fusible links to close dampers automatically in case of fire.

Note 1:

Material of ventilator	Uses of ventilator
Galvanized iron	1. All purposes for which no acid or corrosive fumes pass; standard practice.
Copper	2. All purposes for which long life is desired, provided that no strong acid or alkaline fumes pass.
Choice of metal	3. For ventilating buildings or rooms from which acid or other corrosive fumes rise.
Monel metal	4. Same as No. 3; has longer life, but is more expensive.
Zinc	5. Similar to copper, but a little cheaper.

"ARIN" ANTI-DRAFT WINDOW VENTILATORS. (Installed in Sash.)

Arex-Austor

Scientific Design—This ventilator, designed on the original siphonage principle, assures by natural means constant, positive and uniform ventilation.

The siphon or vacuo chambers are so placed as to concentrate all wind currents into a steady pulling force; by means of deflections opposite each siphon (see sectional view on following page) a powerful vacuum is created, drawing out air at a tremendous speed.

Foul air, warm air, fumes, gases, vapors, steam and smoke are quickly and completely removed. Passing wind plays upon the siphons so as to accelerate the outflow of foul air from interior of building, but it permits none of the outside wind to enter the ventilator. Every opening is an outlet.

Under ordinary conditions Arex-Austor will remove 300 cu. ft. of foul air per square inch per hour on a 9-mile wind velocity.

Upper part consists of a conical deflector top surrounded by a scientifically adjusted broad storm-guard, making the Arex-Austor absolutely storm-proof.

Arex-Austor Construction

Arex-Austors are made of Galv. Iron, Ingot or Toncan Metal, Cold-rolled Copper or any other special metal, in any size or gauge. The installations shown on this page are standard; special bases and pipe connections made to order—submit sketch.

Arex-Austors, 24-in. and upwards are provided with brass bolts connecting the frustum to the siphons. This permits installation in two halves and facilitates painting inside and outside at any time after they have been installed.

Condensation arrestors furnished at nominal cost when requested.

Unequalled facilities for turning out any quantity of any size ventilators on short notice. Prompt shipments from large stock always on hand.

Our engineering department will solve your ventilating problems.

Expert advice without obligation. It will pay you to investigate.

Thousands of installations without a single complaint.

Details and Data, Arex-Austor Ventilators and Bases

Continued on next page

First Class Construction—Fabricated in one solid unit, no solder used, every joint rigidly riveted. Has no movable parts, no shutters or louvers to break off, no ball bearings to clog, no meaningless fancy trimmings to impede ventilating action, nothing to get out of order.

In short, a ventilator, simple in principle, durable in construction and sure to give year-in and year-out service without attention or repair.

Made of galvanized iron, Ingot or Toncan metal, cold rolled copper; or in any special metal in size or gage.

Prompt shipments from large factory stock.

Bottom View

Actual photograph. Note the extraordinary outlet for escape of air—greater than in any other ventilator. Observe the immense ventilating area—the deep, penetrating siphons—the triangular channels between the siphons.

Well-balanced and mechanically perfect *throughout*

Wide Adaptability—Thousands of installations have proven the Arex-Austor to be the ideal ventilator for mills, factories, foundries, warehouses, power plants, train sheds, railway cars, ships, theaters, hospitals, schools, etc.

Can be installed on flat roofs, sawtooth roofs, slant roofs or on skylights and monitors.

Caution: The phenomenal success of Arex ventilators has provoked petty imitations by name, design or principle. Beware of such infringements.

Arex is the only trade-name under which our ventilator is sold.

Standard Specifications for Arex Ventilators

All roof ventilators to be Arex original siphonage ventilators as patented and manufactured by the Arex Company, 2815, 333 North Michigan Avenue Building.

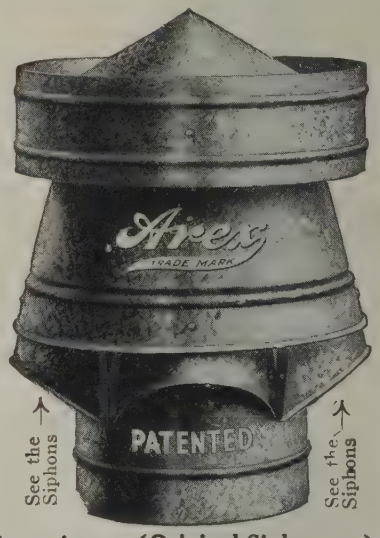
Engineering Service

The first and foremost requirement is air exhaust capacity. Every factor that makes for or against results is of vital importance. The mere purchase of ventilating units does not in itself always solve a problem. That is why we, with 20 years' experience and the record of 200,000 successful installations, recognizing our position and responsibility as the world's largest exclusive manufacturers in this field, surround our product with an engineering service aimed to assure maximum Arex efficiency. This service consists of analyzing a problem, preparing sketch or blue print, making correct recommendation and giving valuable information and expert advice on this all-important subject of ventilation.

Manufacturing Facilities

Our own modern plant and warehouse at South Gary, Ind., afford us unequalled advantages for manufacturing and shipping standardized ventilators in large quantities on short notice.

Special bases and pipe connections made to order from submitted sketches.

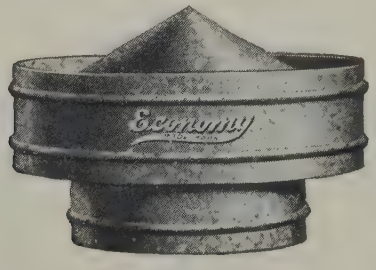


Arex-Austor (Original Siphonage)

Economy Roof Ventilator

This ventilator is designed to meet the demand for a ventilator at lowest possible cost, yet capable of solving any ordinary ventilating problem.

Manufactured in attractive proportional design of solid sturdy construction. Absolutely guaranteed stormproof.



Economy Roof Ventilator

Made in same sizes and gages as Arex-Austors. Workmanship and materials are of the same high quality.

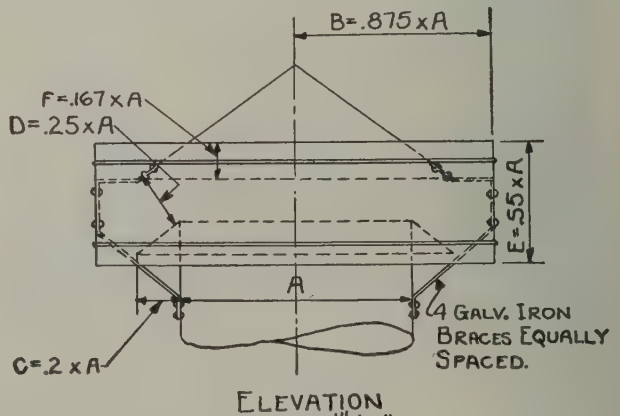
Furnished with or without damper or base.

Prompt shipment from large stock always on hand.

Utility Ventilators

This ventilator is designed especially for use on school buildings. They are made with a storm band larger in circumference and width than those on the Economy Ventilators, but are lower in proportion to width to conform to certain architectural roof lines.

They are made in a full range of sizes and in all metals.



Utility Ventilator

Continued on next page

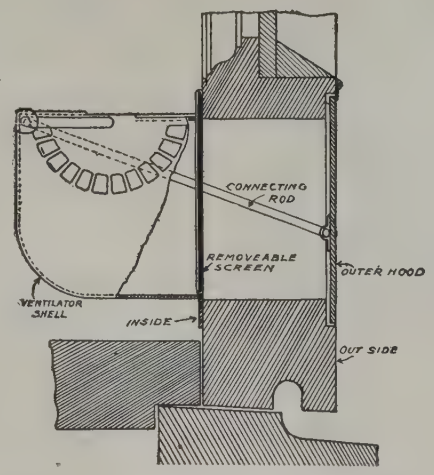
"Arin" Anti-draft Window Ventilator

An adjustable sash ventilator, especially adapted to windows in schools, hospitals, shops, offices, hotels, apartment houses and residences for providing fresh air without creating a draft.

The "Arin" Window Ventilator bears the endorsement of architects, health commissioners, school committees, etc., and complies with every requirement of states and municipalities.

Construction—"Arin" is constructed throughout of hard brass, making it absolutely rustproof and durable. All connections are rigidly reinforced, there being no parts to be damaged through misplacement or careless handling. The workmanship is of the highest class and the entire ventilator is beautifully finished in statuary bronze. Being small, neat and part of the window, it represents a practical, permanent installation of ornamental appearance.

Adjustable Deflector—The sectional details and perspective view herewith illustrates the adjustable deflector plate that permits control of the volume of air admitted to the room and its distribution within the room as well.



Installation Details, "Arin" Ventilator When Closed

Method of Removing or Replacing the "Arin" Removable Screen

Installation—Some architects and engineers when installing "Arin" Window Ventilators in new buildings prefer them placed in the top window rail as well as in the bottom rail.

When desired in buildings already erected, the most practical method of installation is to place them on a 4 or 6-in. panel which will set under the window and may be removed entirely when desired.

Preparation of Rail—Rabbet outside surface of rail around opening $\frac{1}{8}$ in. deep and $\frac{5}{16}$ in. wide. This gives outer hood flush fit and allows $\frac{1}{8}$ in. margin to prevent binding.

Air Filter—Every atom of air entering the "Arin" Ventilator filters through a fine screen mesh which keeps out dirt, soot and insects.

Thus, "Arin" provides a double service—positive protection against draft and dirt.

Standard Specification for "Arin" Ventilators—All window ventilators to be "Arin" Anti-draft ventilators as patented and manufactured by the Arex Company, 1577 Conway Building, Chicago, Ill.

Note: The rail depth is the clearance required in the lower rail above stool when window is closed. The free area is the sum of the openings for the flow of air. When ordering, be sure and state thickness of window rail which is usually about 1¾ or 2 in. Prices on application.

"Arin" Adjustable Louvers

Adaptability—These high grade louvers are installed to insure adequate fresh air supply in connection with any heating and ventilating system, in schools, factories, power plants, transformer vaults, etc.

Advantages—(1) Easy to operate—no sticking.

(2) Absolutely foolproof. Practically indestructible.

(3) Absolutely stormproof and weatherproof.

(4) Blades do not protrude when louver is open.

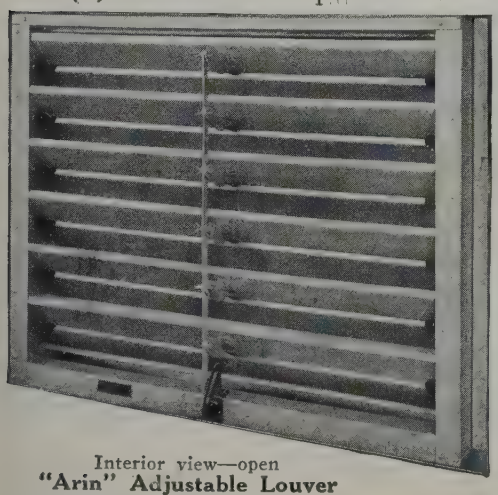
(5) Can be installed in series of two or more units to fit any size opening.

(6) Blades can be removed entirely in case of emergency.

(7) Furnished with birdscreen if required.

(8) Reasonably priced, considering the high grade material and workmanship.

(9) Also made of cold rolled copper or any other special material.



Interior view—open
"Arin" Adjustable Louver

Construction Features—(1) Frame and blades made of No. 16 gauge galvanized steel.

(2) Bronze bearings in frame.

(3) Bronze pivots in blades.

(4) Bronze setscrew and slide.

(5) Adjustable device to lock in any position.

(6) Standard depth 4 in. for any brick or concrete wall.

(7) Perfectly balanced.

Allen Turbine Ventilator

"Let Allen Clear the Atmosphere"

The New Allen Turbine Ventilator—Patented and Patents Pending

A new sturdy, durable and automatic exhauster embodying the turbine principle in its construction, and designed so that it operates not only continuously, efficiently and silently, but to fit into the architectural lines of any building. It has the merits of the power driven systems without the heavy initial cost and continuous operating expense. The perfectly balanced turbine, actuated by the air not only pulls up and ejects smoke, fumes, foul air, gas, dust and moisture, but creates an air circulation.

Whenever a definite number of air changes are required in any type of building the Allen Ventilator can be used. Its constant and uniform displacement enables engineers to predetermine the air condition of any building by applying the guaranteed table of displacements as published on the following page.

This ventilator is absolutely leakproof; its operation is not hampered by ice, sleet or rain. Constant operation under all conditions insures positive and uniform ventilation. The powerful upward suction force of the rotary turbine makes down-drafts a mechanical impossibility. They are constantly efficient and not affected by cross air currents as in the case of types equipped with placement wings.

Lower First Cost with No Upkeep

The first cost of the Allen Turbine Ventilators is not only less than the cost of power-operated exhaust equipment, but all maintenance and operating expense is eliminated. Once installed it requires no attention, care or adjusting.

Construction

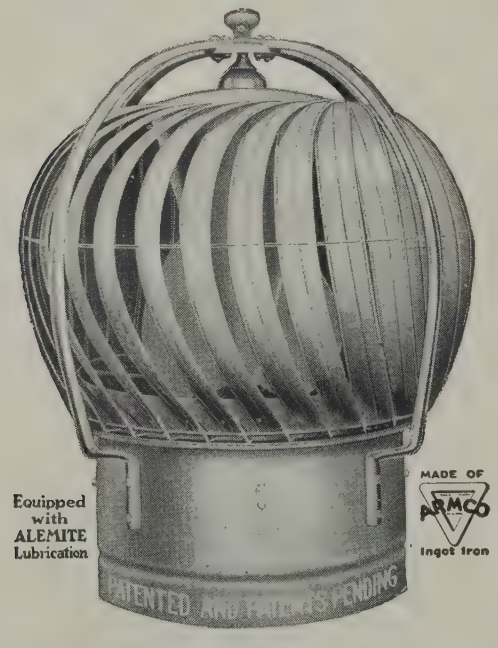
This ventilator is constructed of armco galvanized ingot iron, protected with a special solvent and enamel which resists rust, acid fumes, heat and weather action. This feature is exclusive with our product.

It is also constructed of cold rolled copper.

Alemite Lubricating System—There is embodied in its construction a complete Alemite pressure lubricating and relubricating system.

Sizes—Made in eleven different sizes, 8, 10, 12, 15, 18, 20, 24, 30, 36, 42 and 48 in. These dimensions refer to the diameter of bases of ventilators.

This range of sizes makes them adaptable to care for any ventilating problem.



The New Allen Turbine Ventilator

Typical Allen Installation

Allen Turbine Ventilators Providing Constant, Care Free Ventilation in One of the Largest Installations of Ventilators in the World

Continued on next page

Uses

The Allen Turbine Ventilator is particularly adapted and proven to be most satisfactory in actual installation in displacing vapor (steam), smoke, fumes, poisonous gases, dust, etc., from factories, mills, laundries and garages, and for displacing foul air, moisture, odors and dust from barns, stables, etc. It is preeminently designed and adapted for removing excessive heat units and vitiated air from factories, theaters, schools, etc.

RECOMMENDED AIR CHANGES

Building	Exhaust	
	Per occupant cu. ft. per min.	Minimum number of air changes
Assembly and convention halls	30	8
Boiler rooms		10
Engine rooms		8 to 10
Factories	20 to 30	4
Foundries		4
Garages		12
Halls and assemblies	30	8
Mill buildings	20 to 30	4
Offices	20 to 30	6
Laundries		10
Churches	20	8
Schools	30	8
Theaters	30	8

Great Displacement Capacities

The displacement capacities of the respective sizes in which Allen Ventilators are shown below are conservative, and fully guaranteed. These capacities have been substantiated by numerous actual installation tests.

ALLEN TURBINE VENTILATOR DISPLACEMENTS

Diam. of throat, in.	Air displacement, cu. ft. per hr.		Diam. of throat, in.	Air displacement, cu. ft. per hr.	
	Wind velocity, 4 miles per hr.	Wind velocity, 8 miles per hr.		Wind velocity, 4 miles per hr.	Wind velocity, 8 miles per hr.
8	17,300	21,600	24	149,000	185,000
10	26,500	32,500	30	225,000	272,000

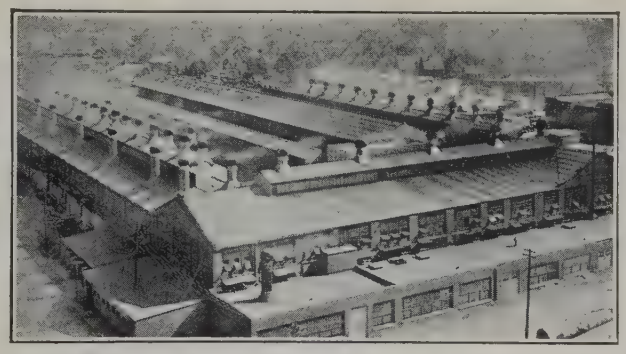
15	54,000	69,000	42	324,000	414,000
18	85,200	102,100	48	360,000	473,000
20	105,100	125,600			



This Plant Completely Equipped with Allen Ventilators

Guarantee

The displacement capacities of Allen Turbine Ventilators, as published and tabulated here, are guaranteed if installed in accordance with the instruction tag attached to each ventilator.

Engineering Service

The Allen Air-Turbine Ventilator Co. maintains an Engineering Department, the service of which is extended to council without cost or obligation.

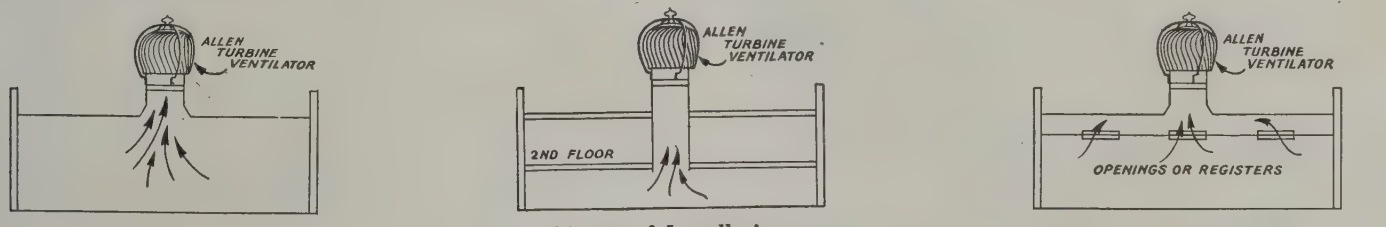
Our engineering staff have had a most diversified experience in handling all kinds of ventilating problems in connection with various types of buildings and the broadest experience in eliminating not only smoke, excessive heat units, vapor, etc., but heavier-than-air bodies, such as gases, fumes, dust and foul air.

Our sales engineers in the principal cities supplement this service and make practical and definite recommendations for the adaptability of Allen Exhausters.

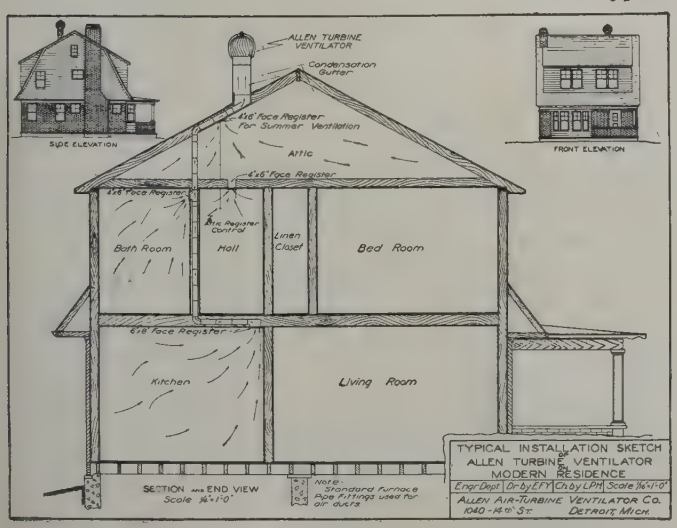
Inquiries as to requirements and cost receive immediate attention.

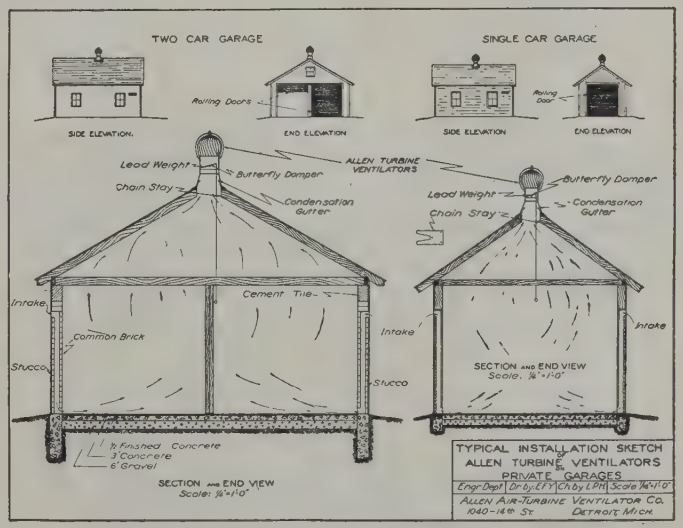
Industrial Ventilation

All industries present unusually difficult problems of ventilation. Allen Ventilators, wherever installed in every line of industry, have proven to be not only the most economical in first cost and maintenance, but efficient in operation. "Ask the user—he knows."



Types of Installation





Continued on next page

Installation Information

Bases should be constructed of a heavy gauge of galvanized iron, which should be square to round and long tapered as shown. This type of base construction not only lends itself well to adaptation on any type of roof but has decided advantages; it increases the area or broadens the scope of exhaust and lessens friction, thereby increasing the displacement. Bases of this type further make for rigidity and long life.

Roof Ventilators for All Requirements

Our 30 years' experience in the roof ventilator business has proven beyond doubt that *no one type* of ventilator will adequately meet all conditions.

We have designed *various* types and are prepared to tell exactly which of these types of the proper size will handle any particular requirement. Some installations require revolving type ventilators, others require metal top sliding sleeve damper ventilators, still another will need a fire retarding type, and weave sheds will best be served by our double damper ventilator. The new Burt Direct Connected Fan Ventilator gives positive action for bad conditions and natural action with fan shut off so for many jobs it is the ideal installation.

Conclusive tests have proven that under certain conditions one of these ventilators will exhaust its maximum per cubic foot while another type will hardly pull anything.

At Akron, we maintain an engineering department which will expeditiously co-operate with architects, engineers, contractors and others in selecting the proper types and sizes of ventilators to suit particular conditions and requirements.

Blue prints of our various types will be furnished on application. Send your specifications, rough pencil sketch or blue print to our engineers, and they will, without cost or obligation, send a detailed analysis of your situation, together with recommendations and quotations.

Materials Used in Burt Ventilators

Burt Ventilators are made of prime open hearth galvanized steel. They can be made of zinc, copper, lead clad sheets, toncan metal, armco iron, alcumite, aluminum or monel metal at slight additional cost.

Burt Patented and Exclusive Features

Among the many features that account for the popularity of Burt Ventilators are the sliding sleeve damper, the spring clip, the notch rim, the condensation gutter and heavy construction.

The sliding sleeve damper efficiently regulates the flow of the air. The spring clip holds the damper rope in place after changing adjustment. The notch rim holds the glass in place on top of ventilator. The condensation gutter gathers the condensation and carries it off to the roof. Burt Ventilators are from 4 to 6 gauges heavier throughout than is customary in many makes of ventilators.

The above features are more fully described under the various ventilators of which they are a part.

Uses

No single type of building, classified either as to use or construction, has been missed by Burt engineers in their surveys. Their experience includes ventilation of buildings from capitol buildings to chicken houses, from power plants and weave sheds to public auditoriums.

Residence Ventilation—Ventilation is also necessary in a residence. It is almost the only way many houses can get fresh air without causing a draft. The top floors in summer months are usually uninhabitable because of the sweltering heat. A Burt Stationary Ventilator in the roof will allow this air to escape. The lines of Burt ventilators have been so simplified that they can be made to harmonize with the general design and construction of the house.

Garage Ventilation—A ventilator placed on roof of a small garage will carry off the carbon monoxide fumes fast enough to make conditions comfortable and safe.

Farm Building Ventilation—Burt Rotary or Stationary Ventilators on barns, assure keeping the animals in a healthy condition. Ventilation of poultry sheds is necessary to obtain the maximum production of eggs and the maximum increase in weight. The smallest of Burt Ventilators will be ample to assure the best ventilation.

Ventilator Capacities

We are very much opposed to publishing ventilator capacities because as a general proposition they simply confuse the person desirous of securing information. We have reliable tests, and will furnish copies with comprehensive explanations to any one interested.

We believe, however, that our guarantee in proposing to place any of our ventilators of any type side by side with any other ventilator, allowing the engineers of the companies interested to be the sole judges of the merit of our product, is the best proposition that we can offer.

We give this in lieu of capacities, because the Bureau of Standards, at Washington, a reliable authority, has given reports which indicate that Burt Ventilators of all types are the equal or superior of any ventilator on the market.

Again, there are so many variables entering into a problem of this kind that a published table is very confusing. We are, therefore, prepared and willing to give you data as to why we take this stand along with information which will enable you to arrive at the number and size of ventilators that might be required. As a matter of fact, the best way to handle this, provided your engineers are not familiar with the situation, is to submit a rough sketch of your building and let us place the ventilators for you.

The Liberal Burt Guarantee

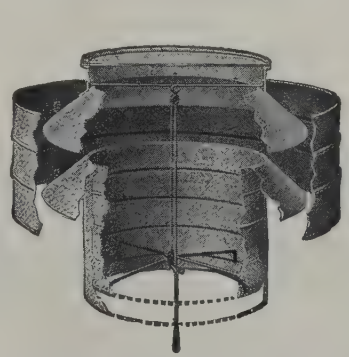
We guarantee Burt Ventilators to be free from defects in workmanship and material, and will replace at any time free of charge, any Burt Ventilator proven defective.

Burt Sliding Sleeve Damper Ventilator

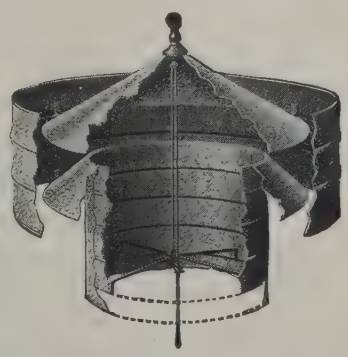
Marketed for over thirty years, this ventilator is not an experiment—it is used by many of the largest industrial plants in the United States.

These ventilators may be had with either metal tops or glass tops. The metal top ventilator serves as a ventilator only, while the glass top serves as a *combination skylight and ventilator.*

Exclusive Features—(1) The patented damper in this ventilator consists of a sliding (telescopic) sleeve, which is operated from below by means of a cord or chain running over a rust resisting pulley. Each ventilator is equipped with a patented clip so that damper can be set in any position and held



Sectional View of Glass Top Sliding Sleeve Damper Ventilator Showing Some Burt Patented and Exclusive Features



Sectional View of Burt Sliding Sleeve Damper Ventilator Metal Top

Continued on next page

there without fastening the cord to a nail, hook or post. As the sliding sleeve damper is not affected by air currents, *it maintains its position* and requires no attention. This construction is a marked improvement over the flat damper type.

(2) The sliding sleeve damper has no flat surface, therefore, it does not collect dust or dirt to be shaken off into the building.

(3) The air shaft is open and unobstructed at all times. Air currents are not deflected downward, and it is possible to adequately ventilate with a smaller number of Burt Ventilators than most competing types.

(4) The sliding sleeve damper makes our glass top ventilator an ideal skylight, as the light is never obstructed.

(5) The glass top ventilator is equipped with heavy ribbed wire glass held in place by a patented notched rim, and made absolutely watertight by means of waterproof cement. Glass can be replaced quickly by merely removing the notched rim, without removing ventilator from the roof.

(6) Our patented trough or lip is placed below the glass top, into which runs any condensation which may gather on the glass. A similar trough on the lower part of the base collects all condensation forming on the air shaft.

How to Specify—See specifications on the following page.

Prices f.o.b. Akron, Ohio, and include sliding sleeve damper.
Ventilator bases are charged for extra, for which prices will be quoted on receipt of specifications. Operating rope or chain not furnished.
Discounts on application.

New Burt Fire Retarding Cone Damper Ventilator

In this type of ventilator, an inverted cone is used as a damper, which is operated from the floor (moved up and down) by a copper chain running over a rust resisting pulley as shown.

The damper of this ventilator is furnished with fusible link which insures it automatically closing in case of fire. When the damper is thus equipped this ventilator passes the approval of the Underwriters' Laboratories, Inc.

The elongated slot in the damper can be used as a clip when the fusible link is placed above the damper. When it is desired to place the fusible link below the damper, the elongated slot is omitted and the chain simply falls through a round hole in the damper. The patented clip furnished then can be placed anywhere within reach of the operator.

The elongated slot and fusible link, of course, obviate the necessity of tying the chain to a post, nail or hook in the building itself.

The construction of this ventilator embodies all the essential features of construction recommended by the American Society of Heating and Ventilating Engineers.

The patented raising and lowering device is simple and positive in action, and is guaranteed not to stick or bind. The air shaft is open and unobstructed at all times—there are no braces of any kind in the air shaft or neck.

The inverted cone damper permits easy flow of air outward—there are no sharp turns or obstructions, and no air pockets.

The *extra wide wind band* makes this ventilator absolutely stormproof and creates a larger low pressure area, and a better exhaust. The location of the louvers, top and wind band have been scientifically worked out so that regardless of the direction of the wind, it can not pass through the ventilator head and get into the building—guaranteed against back-drafts.

Exhaust area is larger than cross-sectional area of pipe, which assures guaranteed exhaust capacity.

How to Specify—See specifications on the following page.

Prices f.o.b. Akron, Ohio. (Discounts on application.) Bases extra. Bird screens furnished at slight additional cost.

Burt Ball Bearing Revolving Ventilator

A neat and well constructed ventilator of the revolving type that has been perfected to the highest point of efficiency.

Its design and open back construction causes the air currents to pass not only over the top and sides, but directly through it, thus creating a partial vacuum in front of the air shaft, which greatly increases its capacity or pulling power. This construction also holds the ventilator steady with the wind.

Each Burt Ventilator is erected and tested in our factory before shipment, insuring perfect balance.

This ventilator is equipped with two sets of high grade steel ball bearings—it is positively guaranteed not to stick or bind. May also be had with Timken roller bearings.

There are no louvers in the revolving head, consequently maximum efficiency is obtained. If bases are furnished by us, we will install flat dampers without charge (see illustration). When specified, we furnish dampers of the fire retarding type which close automatically in case of fire.

This ventilator has proven a success under a wide range of conditions and thousands are now in use.

How to Specify—See specifications on the following page.

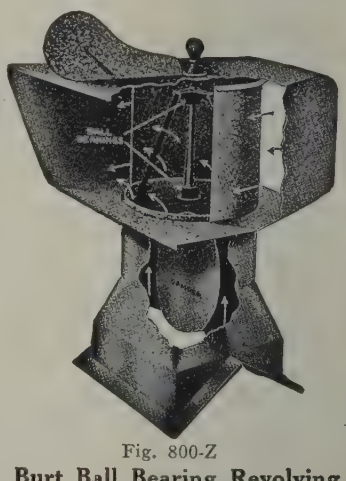

Fig. 800-Z
Burt Ball Bearing Revolving Ventilator

Burt Fan Ventilator

This ventilator effectively and quickly removes excessive fumes, smoke, odors, etc., from theaters, schools, churches, laundries, blacksmith shops, dyehouses, foundries, and other buildings.

Being power driven, it will exhaust, approximately, ten times more vitiated air than a stationary or revolving ventilator.

Other features are quietness of operation, inverted cone damper, fire retarding, low power consumption, and with power off, normal ventilation continues.

There are three distinct types of Burt Fan Ventilators, their grouping depending only upon the way in which they are driven.

Continued on next page

Direct Connected Fan Ventilators—*Group One*—Small sizes from 14 to 20 in. The one illustrated is 20-in. size. This size delivers 1750 cu. ft. of air per minute alternating or direct-current motor. Four-blade fan.

Group Two — Larger sizes 24 to 48 in. Motors available are of five models. Alternating or direct-current motors, 670 to 700 r.p.m. The 24-in. ventilator will remove 4500 cu. ft. of air per minute, the 30-in. 8500, the 36-in. 11500, the 42-in. 13200, and 48-in. 14275 cu. ft. Cost of operating 36-in. size at 8c per kilowatt hour is 22c for 10 hours.

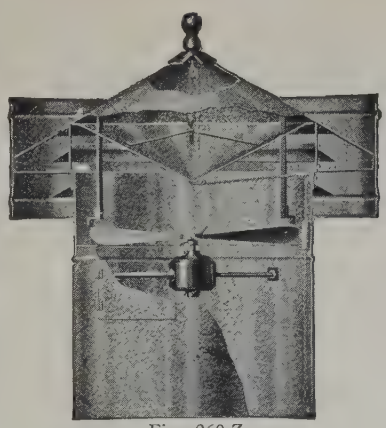

Fig. 260-Z
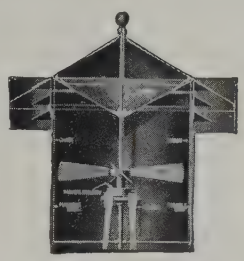
Burt Direct Connected Fan Ventilator

Belt Driven Fan Ventilators—*Group Three*—Made in four types, classified entirely as to method of handling belt drive. Can be driven from line shafting or from individual motors. The two types operating from a line shaft drive are arranged so the idlers can be placed outside the ventilator shaft to operate on a line shafting installed outside on the roof, or with the idlers in the ventilator shaft directly under the fan so as to be driven from a line shafting in the building under the ventilators.



Type 1 has the outside drive.

Type 2 has the inside drive.

Type 3 employs separate motor to drive belt with motor housing outside of building.

Fig. 265-Z
Burt Double Damper Ventilator

Type 4 also has separate motor, but motor is placed inside of the building.

Fans have 6 blades. Motors are standard, 1750 r.p.m. with fans made to be driven between 500 and 650 r.p.m.

Burt Double Damper Ventilator

Designed for weave sheds and places where the condensation forming on the air shaft and the cowl must be prevented from entering the building.

Adopted by many of the largest textile mills in the United States.

The condensation trough in the air shaft of the Burt Double Damper Ventilator collects most of the moisture and passes it out on the roof through the condensation drain. When condensation is severe, the trough-shaped lower damper acts as a drip pan and collects the moisture, the latter being quickly evaporated.

The lower drip pan (below bottom damper) is a safety device that collects any overflow from the bottom damper. It can be piped to pass water out on the roof.

The two dampers are operated simultaneously by means of a cord from below. The cord is held firmly by a patented clip fastened to the roof. Made in all sizes.

How to Specify—See specifications below.

Burt Rectangular Ventilators

Made in all sizes, of any metal desired, with either metal or glass tops, and equipped with our patented sliding sleeve damper described on preceding page.

Suitable for public buildings, foundries, schoolhouses, etc. Can be adapted to any size or shape of roof opening.

How to Specify—See specifications below.

Ventilator Bases

Ventilator bases are made to conform to the pitch of the roof, either round or square. Square bases are recommended for maximum efficiency, capacity and rigidity. Extra heavy (of the same gauge metal as the ventilator itself).

Burt Bases have the following features: condensation trough in every base, 4-in. flashing or more on every base to insure stormproofness, four different types, a type for every condition, and every base made separately for each particular job.

Burt Ventilator Bases

How to Specify Burt Ventilators

Metal Top Ventilator—(1) Furnish and install on roof, where shown on drawings, Burt Metal Top Ventilators, as manufactured by The Burt Manufacturing Company, Akron, Ohio.

(2) Ventilators shall be of diameters shown and shall be constructed of prime open hearth galvanized steel sheets of The Burt Manufacturing Company's standard gauge, strongly braced with galvanized steel bands and properly riveted.

(3) Ventilators shall be provided with sliding sleeve dampers, operating by chains or cords over rust resisting pulleys and equipped with clips so that they can be set in any position and held permanently. When sleeve is at its highest point it shall completely close ventilator.

(4) Ventilators shall be guaranteed against defects in workmanship and material by the manufacturer, who shall agree to replace or repair without charge, any ventilator proving so defective.

(5) Ventilators shall be thoroughly flashed to the roof and be made absolutely watertight.

Glass Top Ventilator—(6) Furnish and install on roof, where shown on drawings, Burt Glass Top Ventilators, as manufactured by The Burt Manufacturing Company, Akron, Ohio.

(Insert paragraph 2 here.)

(7) Ventilators shall be provided with notched rims as manufactured by The Burt Manufacturing Company, Akron, Ohio, for holding glass in place so that same can be replaced if necessary without removing ventilators from roof.

(8) Ventilators shall have troughs or lips placed below glass so as to conduct any condensation or moisture that may form to the roof.

(Insert paragraphs 3, 4 and 5 here.)

Double Damper Ventilator for Weaving Rooms—(9) Furnish ventilators for weaving rooms, as shown on drawings, to be provided with double dampers as manufactured by The Burt Manufacturing Company, Akron, Ohio.

(Insert paragraphs 2, 4 and 5 here.)

Fan Ventilators—(10) Ventilators in ....., as shown on drawings, shall be Burt Fan Ventilators, provided with 6-blade fan mechanism which can be operated by belt from line shafting [belt from motor] [4 blade fan mechanism operated by direct-connected motor].

Note: 24-in. fan to have ¼ hp. motor; 30 and 36-in., ⅓ hp. motor; above 36-in., ½ hp. motor; to be standard as furnished by The Burt Manufacturing Company, Akron, Ohio, unless otherwise specified.

(11) Fan ventilators shall be provided with cone dampers, operated by cord or chain and rust resisting pulleys with fusible links which will cause dampers to drop and completely close in case of fire.

(Insert paragraphs 2, 4 and 5 here.)

Sliding Cone Damper Ventilators—(12) Furnish and install on roof, where shown in drawings, Burt Fire Retarding Sliding Cone Damper Ventilators as shown on drawings, and manufactured by The Burt Manufacturing Company, Akron, Ohio.

(13) These ventilators shall pass the approval of the Underwriters Association of America.

(13a) Ventilator is to have an extra wide wind band as per The Burt Manufacturing Company's standard for this type. Wind band to be located so as to prevent any entrance of outside wind into the ventilator head, whether up from a sloping roof or any other angle.

(Insert paragraph No. 11, but substitute "cone damper regulators" in place of fan. Follow with paragraphs 2, 4 and 5.)

Ball Bearing Revolving Ventilators—(14) Furnish and install on roof, where shown on drawings, Burt Ball Bearing Revolving Ventilators as manufactured by The Burt Manufacturing Company, Akron, Ohio.

(15) Ventilators shall be equipped with two sets of hardened steel ball bearings, and shall have open back construction so as to hold ventilators steady with the wind.

(Insert paragraphs 2, 4 and 5 here.)

Note: In order to satisfy people who are not convinced as to our type of bearing, we are prepared to install at no additional charge bronze ball bearings in place of the hardened steel bearings. We do not recommend nor guarantee this type, but will furnish them if specified.

Square and Rectangular Ventilators—(16) Furnish and install on roof where shown on drawings, Burt Square or Rectangular Ventilators as manufactured by The Burt Manufacturing Company, Akron, Ohio. These ventilators shall be equipped with sliding sleeve dampers [common flat dampers] and with glass [metal] top.

(Insert paragraphs 2, 4 and 5 here.)

Note: If ventilators are to be constructed from copper, zinc, lead clad sheets or any other metal, insert these words in proper space above.

WALTER B. GILBERT & CO.

Manufacturers of "Pullman Ventilators"

YORK, PA.

REPRESENTATIVES

NEW YORK, N. Y., 101 West 31st Street — HELENA, MONT., Raymond C. Grant — TORONTO, ONT., A. & F. Fisher
ST. LOUIS, MO., H. A. Woodworth Engineering Co. — ST. PAUL, MINN., O'Connell Supply Co.

Products

Pullman Ventilating Roof Cowls; Pullman Sash Ventilators.

Also, Pullman Window Ventilators; Automatic Fire Retarding Dampers and Bases.

TRADE MARK
Reg. U. S. Pat. Off.

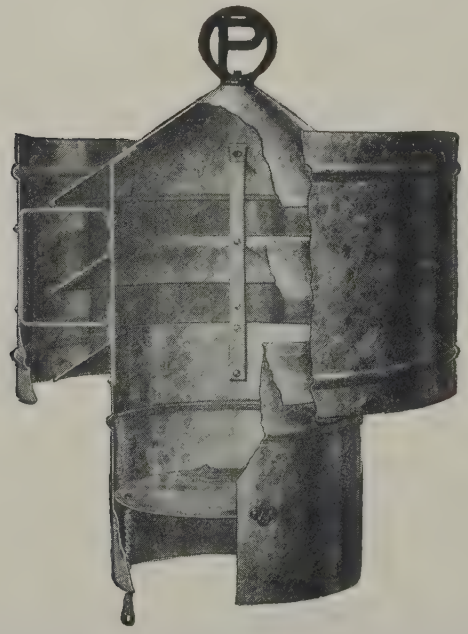
Improved Pullman Ventilating Roof Cowls

Operation—These consist of three cones of the same diameter and arranged one above the other with wide storm band surrounding same.

The ventilator is proportioned correctly to take advantage of the area of low pressure produced by the outside wind back of the ventilator and will not intake under any weather conditions, and is absolutely storm-proof.

The ventilator follows the recommended proportions as determined by the United States Bureau of Standards from an exhaustive series of tests made by them of different type ventilators, and also from our own tests.

Pullman Cowls are always in position to work.



Sectional View Improved Pullman Ventilating Roof Cowl Fitted with Automatic Fire Retarding Damper

Specification Data—Improved Pullman Cowls are regularly made of prime galvanized steel sheets of proper gauges and with galvanized iron braces. Can be furnished made of galvanized armco, toncan or cold rolled copper as specified.

Cowls fitted with Pullman Automatic Fire Retarding Dampers and Bases with condensation troughs to carry the water of condensation from the inside of the ventilator to the roof outside.

Pullman Sash Ventilators

Description—These consist of two parts, i.e., an inside diffusion box and an outside hood.

The outside hoods are made in two styles which are called "Standard" and "Louvre." The inside box is the same in both cases.

The opening required is cut in the bottom sash rail at the mill where the sash are made, and the ventilators are screwed fast to the sash after the same are in place.

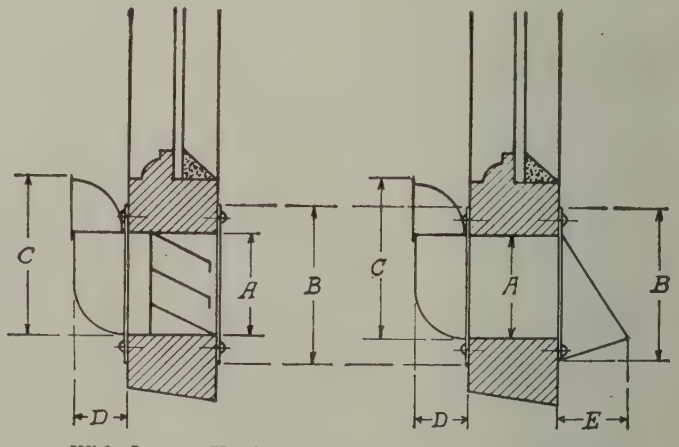
Ventilators are furnished complete with wood screws for mounting.

Specification Data—Pullman Sash Ventilators are regularly made with inside diffusion boxes of sheet brass with brushed brass finish and lacquered all over.

Fitted with hinged shutters to stay in any position from full open to closed.

Outside hoods, "Standard" and "Louvre," are made of sheet steel and finished in rubber finish black lacquer.

Fitted with 16-mesh copper screen cloth.



With Louvre Hood — With Standard Hood

GLOBE VENTILATOR COMPANY

Manufacturers of Roof Ventilators

TROY, N. Y.

Products

"Globe" Ventilating Devices:
Roof Ventilators.
Barn Ventilators.
Chimney Caps.
Car Ventilators.
Lamp Jacks.

"Globe" Ventilator Construction

"Globe" ventilators are made of heavy gauges open hearth galvanized copper-bearing steel (see table below) and are rigidly braced with extra heavy steel bars. In sizes 18 in. and above, the tops and bottoms are made in sections which overlap and are riveted, making them double at each of these points and exceptionally strong ventilators. Their simple and sturdy construction guarantees long life.

They can also be furnished in Armco iron, Toncan metal and copper and with glass tops when light as well as ventilation is required.

72	111	80	12	18 & 20	28	4071.5	480.00

The heavier weights of material are placed in bands and collars of ventilators.
Fire-retardant dampers furnished when desired.
*Galvanized iron ventilators only. Prices of copper ventilators on request.

The design of the "Globe" ventilator, with its curved inner and outer surfaces, is such as to induce a rapid movement of the air outward, at the same time offering a minimum of resistance to the flow. Every inch of its opening is effective in creating efficient, positive ventilation. It utilizes all wind currents and works without wind by natural suction.

If It Isn't a Curved Top It Isn't a "GLOBE"

Metal Top "Globe" Ventilator

Uses—The "Globe" ventilator has been in operation for many years on practically every known type and class of building.

It is removing smoke, steam, fumes, gases, dust, etc., from factories, foundries, steel mills and other industrial buildings, and providing for fresh air in school buildings, churches, theaters, barns, etc. It has back of it years of *proved efficiency.*

Information and Estimates—Prices, blue prints, capacities, working model and complete information will be furnished on request.

Shipment—"Globe" ventilators are carried in stock in the leading cities, and immediate shipment can be made from our factory.

"Globe" Ventilator Bases

Ventilator bases, either round or square, are made to fit accurately the roof pitch, and have 4-in. flanges.

Different types of bases, dimensions, gauges of materials used and average shipping weights are shown below. Square bases are recommended for maximum capacity and strength.

When inquiring or ordering, please furnish pitch of roof (E), state whether for ridge or slope and whether round or square bases are desired. When ordering bases to fit over concrete curbs, give size of opening and curb.

EFFICO FAN EQUIPPED ROTARY BALL BEARING ROOF VENTILATOR HEAD.

EFFICO INTERNAL LOUVER UNIT ROOF VENTILATORS.

EFFICO WIND ELECTRIC FULL AUTOMATIC VENTILATORS.

HIRSCHMAN-PANCOAST VENTILATOR HEADS.

HIRSCHMAN-PANCOAST FAN VENTILATORS, non-automatic.

EFFICO STANDARDIZED ROOF VENTILATOR BASES.

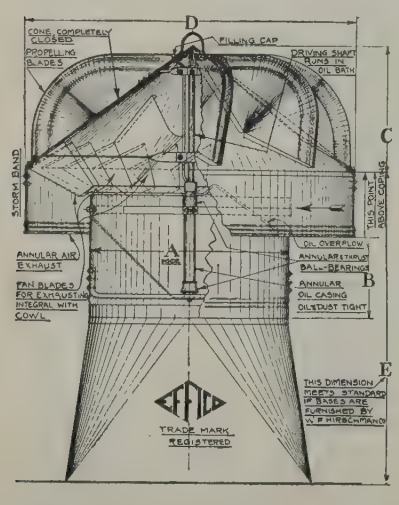
Also Le Roy Internal Louver Unit Roof Ventilators and Effico Skylight Ventilator Unit (Puttyless).

Effico Fan Equipped Rotary Ball Bearing Roof Ventilators

Construction and Principle of Operation—The Effico rotating cowl exterior is covered by wind propelled blades; interior by suction blades. There are no moving parts. Effico shaft rotates on ball bearings, fitted with clock precision in solidly enclosed dusttight and oiltight housings, and is flooded in inches of non-freezing oil (furnished by us); no oiling required for years (proven), but we oil flood them as an extra precaution, and the Effico is absolutely noiseless.

Great Air Volume Exhaust at Low Wind—All Efficos will draw considerable air at a 1-mile breeze (an apparent calm) without stack or heat assistance. The 30-in. size will rotate (standing start) at .7-oz. pressure, ½-mile breeze. Cowl outlet is over 50% larger than its stack area, which is ample, as no wind enters ventilator to gain the so-called siphonage effect. Suction fan is same size as rotating cowl (note dimension chart). Thus each Effico is equipped with fan over 50% greater in diameter than its stack area. Fan pulls air up stack at even the slowest turning movement and wind blowing across the outlet adds to its efficiency.

Percentage of Constancy—With United States Weather Bureau reports as a basis, and their findings that the wind at line of ventilators (over roof) is three miles slower than the tower records, shows the Effico Wind Driven Head during July and August to be 96% constant in New York City, Philadelphia, Boston, Buffalo, Cleveland, Detroit, Galveston, Kansas City, San Francisco, Chicago, Jacksonvile, Florida; 90% constant in Columbus, Ohio, Toronto, Louisville, St. Louis; 80% constant in New Orleans, Milwaukee, Cincinnati and Baltimore.



Symmetry — The Effico has artistic lines and pleasing appearance. Lowest in height of rotary ventilators by over 50% average. Note dimension chart.

Weatherproofness—The Effico Rotary Ball Bearing Ventilator operates during all kinds of weather—rain, ice, snow or sleet does not affect or hamper its exhausting. No drip pans or bird screens are needed.

Cost—Effico Ventilators exhaust more air per-dollar-cost of installation. The wind (only) driven heads exhaust greater volumes and during lower winds, thus a greater capacity within a given period. Effico Wind-Electrics, of course, 100% constant, see second page following.

Effico Rotary Ball Bearing Ventilator Installation

Suggested Specifications—The roof ventilators to be of the sizes as shown in plans and are to be constructed of [galvanized steel] [.... iron] [copper]. They shall be the Effico Rotary Ball Bearing Ventilators as manufactured by the W. F. HIRSCHMAN CO., INC., Buffalo, N. Y. The bases to be [square type] [round type] of same gauge metal as the ventilator neck. The ventilator stack to be sufficiently high to elevate the ventilator propelling blades above coping.

Effico Oil, Dust and Acid Proof Bearing Housings

Continued on next page

Effico Internal Louver Unit Ventilators

The Effico internal louver unit comprises the Effico rotary ball bearing ventilator head constructed with a specially short base, or neck. In this base is built a circular multiple blade louver damper. The damper is carefully balanced and heavily constructed. The blades lap and are fitted in a circular frame. It is adaptable for manual control, but is intended for a thermostatic control system. The roof base is very low, is part of this unit and is supplied with either the square or round base.

The roof base and the ventilator head are connected by means of angle iron companion rings, which give solidity and facilitate the taking down of the ventilator when required. Each ventilator neck has also a tight fitting door to give free access to the louvers and to the operating motor which is suspended underneath the damper to a cross brace. The object of the specially low base and the low roof base is to make the entire unit as low to the roof as possible.

Effico Louver Dampers—Made of stretcher leveled sheet steel. The pneumatic damper motor is supplied and installed with these units unless not desired. (Note specifications below.)

Exhaust Capacity—Same as Effico Rotary Ball Bearing Head on preceding page.

Effico Louver Unit—*Low height.* The Effico louver unit sets very low (note dimensions at right).

Height above Coping—Louver Unit "C" dimension should be above coping.

Effico Rotary Ball Bearing Ventilator Head—The Effico rotary ball bearing ventilator head is already lower in height by 50% than other rotary types of ventilator. By using the construction as outlined above, the entire unit is brought as *low* to the roof as is permissible to still allow the air free exhausting, and to maintain the outlets above the snow line.

Cost—By adopting the circular multiple louvers, of which we are the inventors, we can standardize on sizes and build the round louver for considerably less than the square or rectangular styles, many of which we have built in the past years.

By installing same in the neck of the ventilator at our shop, we not only give a perfect fit, but also eliminate all indefiniteness as to the correct location and size of the damper and cut the installing cost to one-quarter. It is also easier to install the operating motor and makes it more accessible. The size of the damper is the full size of the stack, and yet is about 40% smaller in area than those heretofore used in the square or rectangular louver, again reducing the cost considerably. By supplying the contractor with the complete unit the builder is assured of a well designed, uniform and complete apparatus.

Heretofore, the contractor purchased the ventilator from one manufacturer, probably built the roof base himself, and purchased the dampers elsewhere, or even the dampers were supplied and installed by another contractor. This added materially to the cost.

Corrosion Protection—All interior fabrication members are Cadmium plated after forming and punching. For galvanized ventilators, bolts and nuts are also Cadmium plated. For copper ventilators, bolts and rivets are solid brass and copper. Only carefully selected prime sheets and materials are used throughout, whether of galvanized, copper, or other special metals.

Typical Effico Louver Unit Installation

Effico Wind-Electric Ventilator, Full Automatic

Principle of Operation—This is the regular Effico wind driven head as described on second page preceding with an auxiliary electrically-operated fan.

When the wind is blowing sufficiently to drive the wind turbine, and remove the desired amount of air from the building being ventilated, the electric motor is still. Instantly, when the wind turbine moves below previously-determined revolutions, the electric motor carries the load, starting automatically, and runs until the wind again drives the wind turbine. The *electric motor is cut off and on automatically.* The throat is slightly enlarged to allow for the motor.

When to Use—For installations which require a definite minimum exhaust at all times or which may require an unusually heavy exhaust at intermittent periods. For exceedingly difficult installations, where Effico Ventilator Heads (wind driven only) due to location are not practical, the Effico Wind-Electric Ventilator will successfully ventilate any type of building.

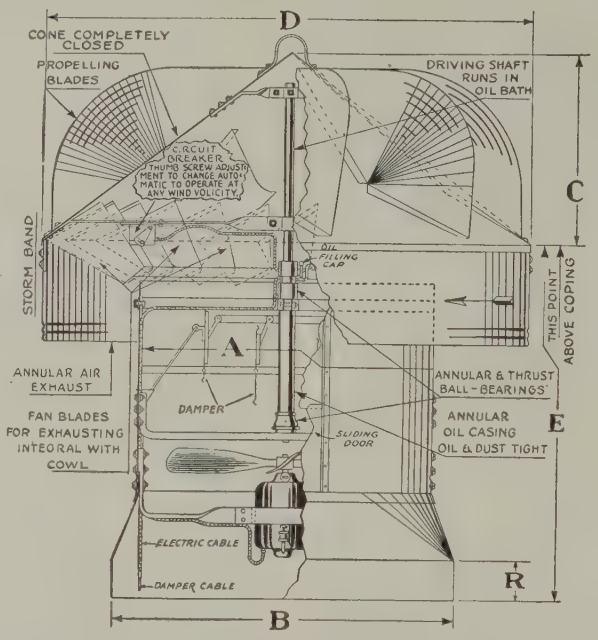
Special Advantages—Besides the regular automatic operation the motor may also be so connected as to give a maximum exhaust capacity (running full speed) by manual control, thus allowing a great volume of air to be exhausted at will.

Adaptability—Adjustable to exhaust various quantities of air within the limits of given sizes and is regularly supplied at capacities equivalent to a five-mile wind and ten-degree temperature difference rating.

If the wind drops below five miles per hour or temperature below ten degrees difference, the Effico Wind-Electric Ventilator maintains its regular exhaust capacity.

Any other capacity can be supplied and the ventilator is adjustable to any constant capacity after installation.

Power Consumption—1/30 hp. to ½ hp. Effico Wind-Electric Ventilators require very little power.



Details of Effico Wind-Electric Rotary Ball Bearing Ventilator

Patented May 20, 1922, Mar. 20, 1928
Other patents pending

Static Pressure—Motor and fan can be supplied to pull against ⅛-in. static resistance by the employment of motor only, or motor and wind turbine. This will have no deteriorating effect on using apparatus for regular ventilating purposes.

Selecting a Ventilator—When in need of a ventilating apparatus it is best to choose one that does not depend upon mechanical exhausting *only,* for a good roof ventilator is acknowledged to be *superior* to an arrangement that closes entirely unless the motor is running.

Self Contained Unit Construction—The Effico Wind-Electric Ventilator comprises the wind turbine, the same type head as described on previous pages, electric motor, fan, and roof base which form a complete exhaust unit. The motor is furnished and installed by us in the ventilator.

Dampers—Effico Wind-Electric Ventilators are supplied with tight fitting, carefully balanced dampers. The larger sizes are furnished with Effico Multiple circulator Louver Dampers. See preceding page.

All are operatable by chain or by compressed air in connection with thermostatic controlled heating and ventilating systems. Pneumatic damper motor is supplied and installed in the ventilator if desired.

Effico Low Height—All Effico Ventilators are lower in height than any other ventilator by almost 50%. "C" dimension should be above coping. Note dimensions below.

Finish—Handsomely painted in red or any desired color if made of galvanized sheets.

Specifications—The roof ventilators to exhaust from (....) to be the Effico Wind-Electric Ventilators (full automatic) as made by the W. F. Hirschman Co., Inc., Buffalo, N. Y., the sizes to be as shown on the prints. They shall be of [galvanized steel] [toncan metal] [copper]. The current for the motors is: current ....; voltage ....; cycle .....

CAPACITIES OF EFFICO ROTARY BALL BEARING VENTILATORS—AUTOMATIC WIND-ELECTRIC

Battery of Effico Wind-Electric Full Automatic Ventilators

This battery of three 48-in., two 42-in., and one 36-in. Effico Wind-Electric Full Automatic Ventilators were photographed before installing. Note size by contrast with the background. They have a combined exhausting capacity of 31,500 c.f.m., regardless of wind velocity or temperature difference and can be adjusted to a 25% increase if necessary. Combined motors have only 2 hp. consumption. Now installed in a Massachusetts school.

Continued on next page

Hirschman-Pancoast Ventilators

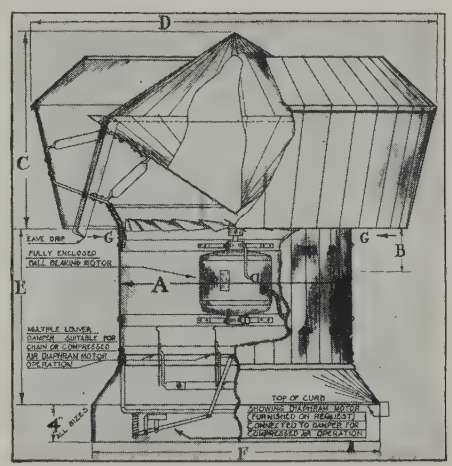
The Hirschman-Pancoast Ventilator heads are made of only prime sheets. The fabricated members are carefully formed to offer the least resistance to the air flow. These members for galvanized ventilators, are cadmium plated after forming. For copper ventilators, the smaller size members are made of copper. For very large ventilators the members are iron, cadmium plated. Electric welding is used considerably, all rivets have washers under the burred end of rivet, like all Hirschman products.

Hirschman-Pancoast Ventilator Head

Design and Appearance—A ventilator designed to exhaust air at the highest possible velocity. Strength (sturdy construction), weather-proven, high syphon exhaust capacity and appearance, in the order named are given consideration in the design of this ventilator.

Exhaust Head—The design is such that air driven 1200 ft. velocity through the head, registers only .015 water gauge static pressure. This is unequalled by any other known shape. Thus for a fan or high heat exhaust head, it is unequalled. When so used and the fan is cut off the ventilator still ventilates as a syphon ventilator. There are no shutters to blow or freeze shut.

Weatherproof — Absolute, no rain, snow or storm can beat in. Is also visionproof, will resist back-drafting during a five-mile wind against an adverse temperature difference of ten degrees Fahrenheit. Also during the same wind velocity will not back-draft unless a greater than static pressure resistance of .025 water gauge.



Hirschman-Pancoast Fan Ventilator (Patented)

Exhaust Capacity Syphonage Principle—Note capacity chart, these capacities are conservative. The Hirschman-Pancoast is a very high grade stationary type syphon ventilator. It starts exhausting at slightly over a two-mile wind without any temperature difference.

The Hirschman-Pancoast Fan Ventilator (non-automatic)

For free air or as a pressure blower, is decidedly an apparatus of high merits for a specific application.

Recommendation — Is a high class ventilator where a high exhaust velocity against resistance is required, especially at certain periodical times. Where the Effico Rotary Head, or the Effico Wind-Electric Automatic Ventilator, due to obstructed location or its moderate even capacity is not required, then we recommend the Hirschman-Pancoast Ventilator.

Construction—Very heavily made, and employing only the best types of motors. *Access door to motor and fan provided.* Motor and fan protected against the elements as well as if installed in the building.

Dampers—Chain operating, close fitting damper supplied with all sizes unless otherwise ordered. Can be supplied with circular multiple louver damper with, or for, pneumatic damper motor.

Bases—Included with fan ventilators.

Cost—A moderately priced exhauster of unusual merits.

They shall be the Hirschman-Pancoast Fan Ventilators as manufactured by W. F. Hirschman Co., Inc., Buffalo, N. Y.

THE IONA VENTILATOR COMPANY, INC.

2821-29 West Dauphin Street, PHILADELPHIA, PA.

Products

XIT VENTILATORS, Round or Rectangle, metal tops; XIT AUTOMATIC TEMPERATURE-CONTROLLED DAMPERS.

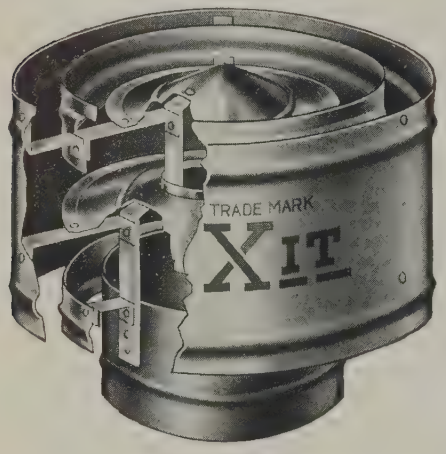
IONA VENTILATORS, Round or Rectangle, with metal or glass tops.

Xit Ventilators

Designed to meet perfectly those cases where the highest possible efficiency is demanded. Its construction is unusually substantial. Warranted stormproof, and its exceptional efficiency has been repeatedly demonstrated in actual comparative tests with the best ventilators previously available.

We believe the XIT to be the most efficient ventilator ever built because of its large area of vertical exits and its great total exit area.

Basic Principles of Design—(1) Head 80% greater in diameter than shaft of ventilator. (2) Width of storm band 80% of diameter of shaft and so placed as to exclude external air from ventilator head. (3) Area for air leaving ventilator head (not including bottom opening at head) 75% greater than cross-sectional area of shaft. (4) Principle of action or suctions is that of chimney or stack, which is doubled by a second or internal band, thereby making two points of suction which are always to the lee side of ventilator, resulting in greater increased movement of air therefrom.



Xit Ventilator

Dampers — Flat, butterfly, fire retarding or temperature-controlled types, with felt edge when desired to be airtight.

Xit Guarantee—Our guarantee is of the most substantial character, providing not only against defective materials, but backing our claims for this unusual ventilator to the extent of offering to take back within 60 days of date of purchase at our expense, refund any payments made and bear transportation costs both ways, any XIT ventilator that fails to fulfill what we specify for it at the time of sale.

Xit Automatic Temperature-Controlled Dampers

Operation—XIT Automatic Temperature-Controlled Dampers are operated through The Fulton Company's Sylphon Regitherms (which, as used on this damper with patented operating connections, are complete operating units, regulating the temperature at a set point) or they may be locked in open or closed position. It is obvious that even temperature is desirable in all rooms with varying exposures without loss of heat through improper operation of ventilating controls. This may be accomplished through the use of XIT Automatic Temperature-Controlled Dampers.

Specifications—Furnish and install XIT Automatic Temperature-Controlled Dampers as made by the IONA VENTILATOR COMPANY, INC., Philadelphia, Pa., and sylphon regitherm with necessary registers and connections.

(2) All damper blades to be made of aluminum with brass connections and ball bearings.

(3) The regitherm shall operate ventilator damper to which

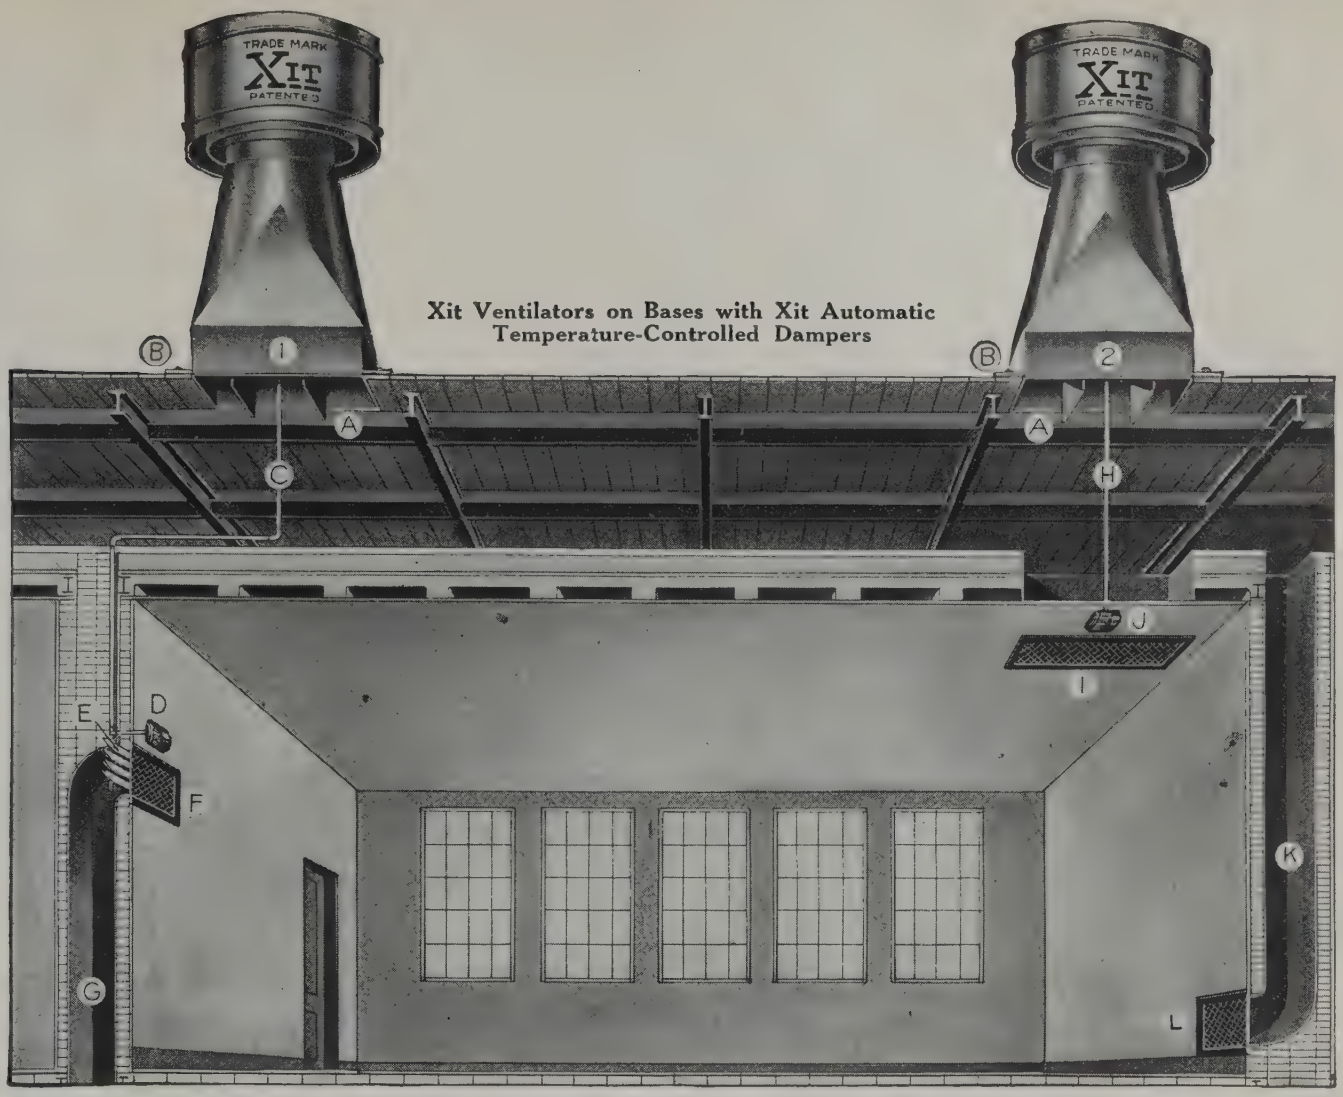
**Note:* The figures in this table are for immediate practical use without reduction. They are not theoretical calculations but can be depended upon for actual ventilator capacities. They do not have to be divided by 2 or 3 to arrive at a practical working basis.

Continued on next page



Two Systems of Installing Xit Automatic Temperature-Controlled Damper

Figure 1—Joint unit operation from temperature of room, by Xit Automatic Temperature-Controlled Damper (A) with heat flue damper (E) which is operated by sylphon regitherm (D) through connecting rod (C). Air enters room from heat flue (G) and register (F) and is drawn from room through register (L) and duct (K) to loft, and out of building by Xit Ventilator (1).

Figure 2—Represents connection to room through loft flue and ceiling register (I) Xit Automatic Temperature-Controlled Damper (A) connected to sylphon regitherm (J) by operating rod (H) which operates damper from temperature of room, or flue (K) may be used. Flange for connecting to roof (B)

it is attached at a variation not to exceed 2° above or below any given point.

Heat Register—The regitherm shall operate ventilator damper and heat regulating damper to which it is attached at a temperature variation not to exceed 4° above or below a given point.

Bases—All bases to be of the box to transformer type and of material not lighter than that of which ventilator is made, with flange of sufficient width to guarantee a watertight connection at roof.

Further Information and Prices—Furnished on request.

Iona Ventilator

The nearest approach to the straight pipe ventilator; standard and successful for 20 years.

Fire Retarding Damper—Damper used exclusively in this ventilator automatically opens or closes, as desired, in case of fire. It requires no attachment inside of building to hold it in any desired position.

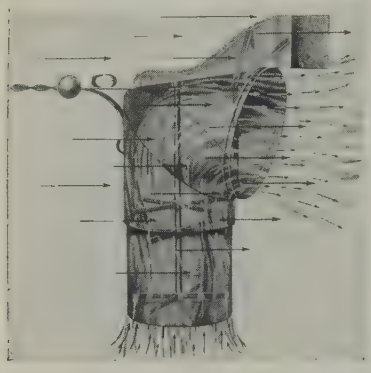
Products

AEROPLANE ROTARY VENTILATORS; AEROSQUARE (Rotary Principle) VENTILATORS; JORDAN SYPHON VENTILATORS; JORDAN TURBINE VENTILATORS; AEROPULL STORM BAND VENTILATORS.

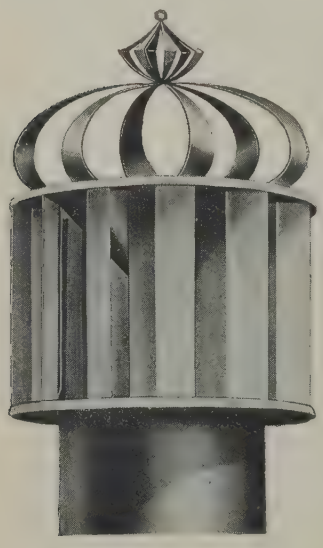
Aeroplane Rotary Ventilator

A rugged, top balanced rotary ventilator with main bearing at the top. Free swinging, perfectly balanced, sensitive to lowest air movements. Four special shaped planes keep the mouth always away from the wind; exceptional—a cheap ventilator on the basis of capacity. The patented main bearing is of bronze or steel one-ball type, non-corrosive, absolutely reliable, with no setting tendency. Well braced with steel flats set edgewise, reinforced with riveted steel segments, seamed and riveted throughout. Heavy storms or high winds cannot affect its shape or impair its efficiency. No maintenance of operation costs.



When used on a gravity system Aeroplane insures a positive flue action at all times.

Where used on a blast system it relieves pressure on the fan and saves current and wear.

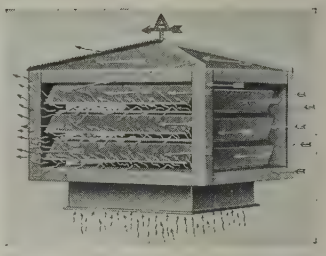


Jordan Turbine Ventilator

A sturdy new perfected turbine ventilator with a higher ratio of efficiency than the usual turbine ventilator. In fact, it is on an equal basis with our rotary or syphon ventilator. A distinctive feature is the tight top with an overhang of 25% in all directions beyond the neck of the ventilator, eliminating water leakage. The bearing is special of bronze on polished iron running in oil. Ornaments on top can be furnished to suit the architectural line of the building.

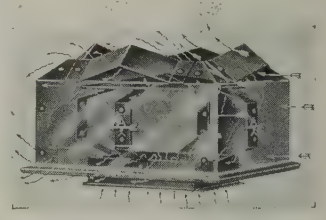
Aerosquare Rotary Principle Ventilator

A pleasing rotary principle ventilator. Square and low, it conforms to the usual lines of American architecture. It calls no attention to itself nor does it break up the roof line. The dimensions are generous and adjustments positive. The obstruction to the wind is wide, giving a large area of low pressure. The neck is square and the exhaust area is about 30% greater than the usual exhaust area.



Jordan Syphon Ventilator

A new type of syphon ventilator with tubes at the top emptying entirely outside of the ventilator. It is the result of experiments which brought out the fact that ejector tubes (commonly called syphon tubes) should not empty into the area of low pressure. Ejector tubes emptying into the ventilator have the same effect as opening a check in a furnace flue. They kill the draft. Extreme efficiency in a syphon ventilator will be found in the Jordan.



Aeropull Storm Band Ventilator

A good low priced ventilator designed especially for fan work. It is well designed and free from choking down tendencies. The storm band and the free exhaust area are 50% greater than are usually standard with this type of ventilator.

What Size Ventilator to Use

A long experience in determining sizes and in testing results has built up for us a knowledge of the proper size of ventilator to be used under different conditions for any required footage, which we now pass on to you. Manifestly, the same ventilator will do more on a fan job than on an open roof, and less on a gravity flue installation than on either of the former. We have considered this in making up our table as follows:

The figures below apply to either Aeroplane, Aerosquare, Jordan Siphon or Turbine Ventilators, whose relative capacities are very close to each other. A liberal factor of safety is included.

Size of ventilator to be used	Fan flue installation, cu. ft. per hr. required	Gravity flue installation, cu. ft. per hr. required	Open roof installation, cu. ft. per hr. required	Price of G. I. ventilators	Price of G. I. bases

Products

"STAR" VENTILATORS: Standard, Fire Retarding, and Glass Top Types.

For "Almetl" Doors and Shutters, see page A967.

Standard "Star" Ventilators

A scientific combination of the ejector and siphon principles applied to stationary roof ventilators, which in conjunction with large exhaust outlets protected to defy the elements, gives a maximum of efficiency at a minimum of investment cost.

Furnished with flat glass top when desired by replacing the conical metal top with wire glass. In no way are the exhaust and stormproof qualities affected.

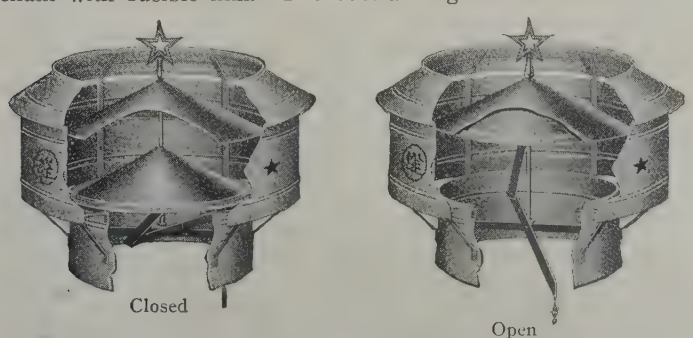
Standard Type "Star" Ventilator

Fire Retarding "Star" Ventilators

Of the same appearance and construction details as the Standard with the addition of a patented gravity damper. A chain connected by a fusible link holds the damper in any position between open and closed; and is arranged to automatically drop to a closed position when exposed to a high temperature. This style is particularly recommended for factories, warehouses and buildings where control of heat losses during winter months is desired.

Fire Retarding Skylight "Star" Ventilators

This device is a combination skylight and dampered ventilator. It is provided with annular damper connected to a chain with fusible link. The outstanding feature of this ventilator is the admission of light even though the damper may be in closed position. This type differs somewhat in appearance and construction details from the standard type, is weatherproof and has ample exhaust capacity.



Fire Retarding "Star" Ventilator with Automatic Gravity Damper (Patented)

Bases

Bases are regularly made of the same weight material as the ventilator proper. Regulation bases are made square at the bottom and gradually taper to cylindrical shape at the top. Straight pipe bases furnished when requested.

All bases have roof flanges of suitable width. All seams and joints thoroughly soldered to prevent leakage.

Flat disc counterbalanced dampers, strongly reinforced for rigidity, operated by either cord or chain, also furnished when required. These flat dampers are held on specially designed pivots, made of brass to prevent corrosion.

Base without Ventilator Showing Disc Damper

Exhaust Capacity

Recent comparative tests based on wind action only of roof ventilators conducted at Engineering Experimental Station, Kansas State Agricultural College, developed the "Star" to have a greater average exhaust capacity than any in the following groups of types tested: open pipe, plain stationary, siphoning stationary, and plain rotary, with wind velocities at 4. 6, 8 and 10 miles per hour.

EXHAUST CAPACITIES OF "STAR" VENTILATORS

Size, in.	Gauge steel	Weight C. R. copper, oz. Product

"K-S-V's" (KERNCHEN SIPHONAGE VENTILATORS).

"K-S-V's" Are Correct Siphons

The correct siphon is the most powerful pulling force known to this field of ventilation. It not only exhausts, but it pulls terrifically. The siphons harness the lightest air currents, compressing and compelling them to co-act in mightily increasing the suction of air out through the ventilator.

TRADE-MARK

Construction

Simplicity of construction and complete absence of the friction inevitably involved in old-style rotary mechanisms make the "K-S-V" a troubleproof, lasting investment. Free area of outlet over 200% of pipe area. Nothing to choke or hinder. Friction at minimum, exhaust at maximum.

The eduction pipe is cylindrical with V-shaped notches or openings at the top, each covered by a siphon tapered inwardly toward the top, the total of four siphons being covered by a jacket of conical shape, whereby other siphons (four) are formed, greatly increasing the terrific pulling power. In addition, a top construction of two specially designed hoods is used, augmenting considerably the pulling force and making the unit stormproof.

The absence of friction, no revolving mechanism being present, means silent performance, nothing to wear out, nothing flopping around, no maintenance cost. A rotary requires a certain wind energy to swing it around *before it gets ready to ventilate.* The "K-S-V" *uses this wind energy to ventilate.*

Furnished in any size and made of any metal desired such as galvanized steel, Keystone copper steel, Armco iron, Toncan metal, cold rolled copper, aluminum zinc, monel metal, etc.

Furnished with or without base (see following page) damper or condensation arrestor.

Special Ventilation Service

The KERNCHEN COMPANY specializes in ventilation and its engineers are always available, gratis.

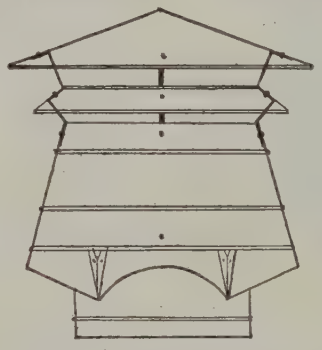
Particular attention given to difficult or unusual problems involving great heat as well as temperatures below the freezing point; steam conditions; elimination of condensation, moisture, fumes, gases or smudge, foul or vitiated air, in every type of building or room.

Specifications

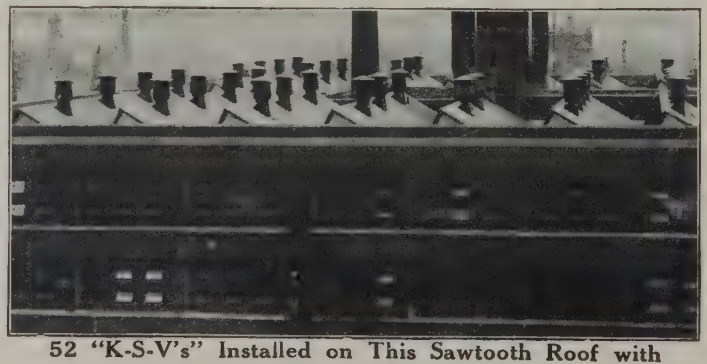
Roof ventilators to be "K-S-V's" as manufactured by the KERNCHEN COMPANY, 101 East Wacker Drive, Chicago, Illinois, in the following sizes (specify sizes by neck diameter and quantity of each size).

Bases are to be "K-S-V's" as manufactured by the KERNCHEN COMPANY, 113 West Washington Street, Chicago, Illinois, and furnished in following types to fit ventilators (specify by type number; see following page and give pitch of roof in inches per foot).

Caution—Beware of imitations and infringements; protect yourself by specifying "K-S-V's."



"K-S-V" Drawn to Exact Proportion



52 "K-S-V's" Installed on This Sawtooth Roof with Pivoted Sash

Where Used

For all buildings and all bad air conditions. A "K-S-V" does the work of three others. Save this cost!

Booklet—"It Pulls"

A postal will bring our latest illustrated booklet, "It Pulls," containing complete information concerning "K-S-V's" (Kernchen Siphonage Ventilators).

Five 42-in. Ordinary Ventilators Replaced by Five 36-in. "K-S-V's"

This is one of hundreds of instances where ordinary ventilators have had to be torn out and replaced by "K-S-V's." But there is *not one* instance we know or ever heard of where "K-S-V's" were replaced by any other kind of ventilator

Official Tests

Nothing is more deceptive than irresponsible, theoretical tests.

Exaggerated performance figures will appear to be justified at times by laboratory tests conducted under conditions which are more favorable than those found in actual service.

It is only when laboratory and *field* tests agree, that the results can be taken as conclusive.

Note particularly the consistent figures in the two accompanying tests by national authorities, one conducted in the laboratory, the other on the Leader Building installation in Cleveland, Ohio.

OFFICIAL TEST OF "K-S-V's" (KERNCHEN SIPHONAGE VENTILATORS) CONDUCTED BY ARMOUR INSTITUTE OF TECHNOLOGY, CHICAGO

SHOWING EXHAUST UNDER DIFFERENT WIND VELOCITIES, AND WHICH SCIENTIFICALLY PROVES THE TERRIFIC PULLING POWER AND 100% TO 300% MORE EFFICIENCY THAN THAT OF OTHER VENTILATORS

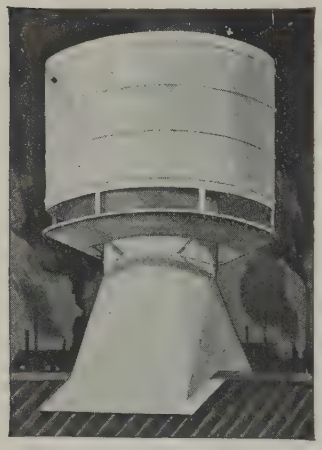
TRADE-MARK

Robertson Ventilator

The successful ventilation of industrial and commercial buildings depends directly on the achievement of correct answers to these fundamental questions:

How many roof ventilators will be needed to ventilate the building effectively and economically?. . . . . What should be the *size* of these ventilators?. . . . . Just *how* and *where* should the ventilators be installed for best results?



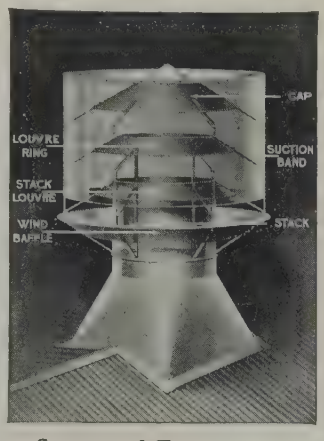
Robertson Ventilator

Equipped with an installation of Robertson Ventilators, a building will be ventilated with *maximum* efficiency and at the lowest cost obtainable with such efficiency. For every Robertson Ventilator installation is based on *facts*. Guesswork and rough estimates of ventilator requirements have no place in Robertson Ventilation Engineering.

The services of the Robertson Ventilation Engineering Department are available without cost or obligation to architects, engineers and plant officials. Robertson Ventilation Engineers make a thorough and comprehensive study of each ventilation problem. They get at the facts underlying every particular requirement. They bring to bear on each specific problem the *facts* which they have accumulated through years of experience in the ventilation of buildings of almost every type.

Then, after having determined the building's ventilation requirements with scientific accuracy, our engineers specify an installation of Robertson Ventilators that meets each specific need in every respect. A Robertson proposal will call for exactly the size and number of ventilators required for the efficient and economical ventilation of the building. Robertson Engineers specify no more ventilators than are needed and no less.

These are the reasons why a Robertson Ventilator installation—based on facts throughout—can be depended upon to maintain proper air conditions in industrial and commercial buildings at all times, and assures *most ventilation per dollar.*

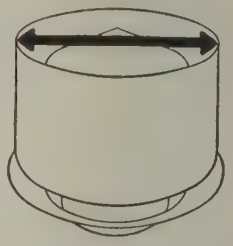


Structural Features of the Robertson Ventilator

Robertson Ventilator Construction and Advantages

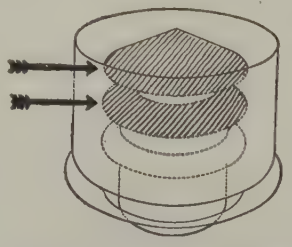
The Robertson Ventilator has an exceptionally powerful exhaust capacity—a superiority which is due primarily to the Robertson *suction band*. This band, scientifically designed as to size, proportions and position, multiplies the displacement or air pulling area of the ventilator more than six times.

Passing winds blowing across the top and bottom of the *suction band* create a partial vacuum in the *ventilator pipe*—a strong, continuous suction which literally pulls foul air, fumes, smoke, steam, etc., out of the building.



Enlarged Air Displacement Area
Gives powerful exhaust capacity

The condensed table of capacities below shows the exhaust capacity of Robertson Ventilators of various sizes under the following conditions: wind velocity—8 miles per hour; difference in temperatures of indoor and outdoor air—20° F.; height of ventilators above air intake—50 ft. These figures are dependable. They represent *actual* discharge capacities, not the so-called "rated" capacities which are widely used in connection with roof ventilators and which are, as a rule, merely a matter of estimate.



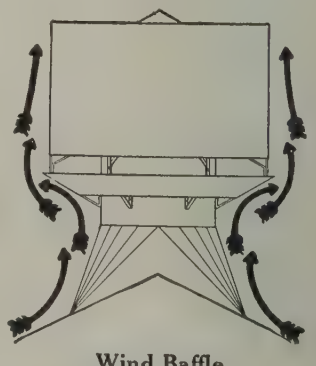
Cap and the Louvre Ring
Make the ventilator positively stormproof

CAPACITIES OF ROBERTSON VENTILATORS

Size, in.	Discharge cap. per min., cu. ft.	Size, in.	Discharge cap. per min., cu. ft.
12	462	42	5658
16	898	48	7398
18	1041	54	9341
20	1499	60	11560
24	1848	66	13872
30	2882	72	16646
36	4160	84	22472

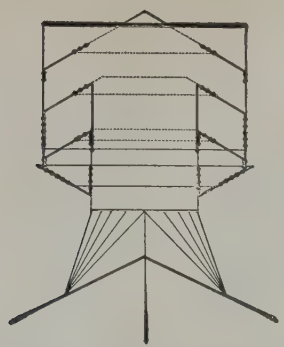
A roof ventilator whose design permits rain, snow and wind to enter a building is not an efficient ventilator. One of the great advantages of the Robertson Ventilator lies in the fact that the *cap* and the *louvre ring* render it positively stormproof and make it impossible for downward air currents to enter the ventilator and interfere with its natural discharge.

The *wind baffle* of the Robertson Ventilator is the invention of Robertson Engineers and is to be found on no other ventilators. This feature has solved one of the most difficult problems in roof ventilator design. It positively overcomes the adverse effect of wind currents deflected upward from pitched roofs. Upward air currents entering a ventilator from below seriously interfere with the discharge of air. The Robertson *wind baffle* deflects such air currents, as shown in the illustration, and thus prevents them from entering the ventilator. This is the reason why no other ventilator on the market today can compare with the Robertson Ventilator in efficiency on pitched roofs.



Wind Baffle
(A patented feature)
Produces remarkable efficiency on pitched roofs

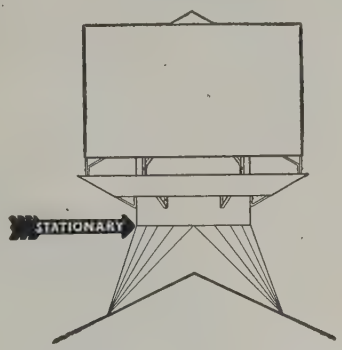
Continued on next page



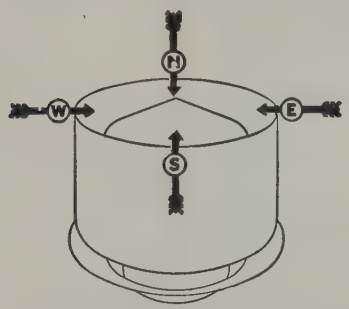
Braces Efficiently Designed, Placed and Secured Provide Exceptional Rigidity and Strength

The various component parts of the Robertson Ventilator are joined together into a strong, rigidly constructed unit by an efficient system of bracing (as shown in the accompanying illustration and also in the phantom view on opposite page). The ventilator parts are bolted to the braces and held permanently tight by lock washers. The result is a ventilator of exceptional structural strength and rigidity.

The modern tendency is distinctly towards ventilators of the *stationary* type—ventilators with no moving parts that require a perfectly level setting for efficient operation. The Robertson Ventilator is of the *stationary* type. Once erected, it requires no further attention, no adjustments of any kind, no repairs.

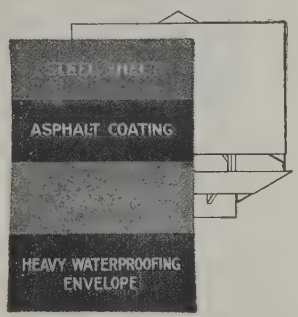


A Ventilator of the Stationary Type
No moving parts



Robertson Ventilator Operates Efficiently Regardless of Wind Direction

Because it is of the *stationary* type—with no moving apparatus to be caught and operated by the wind—and because it presents a uniform surface in all directions, the Robertson Ventilator operates efficiently at all times *regardless of the direction of the wind.*



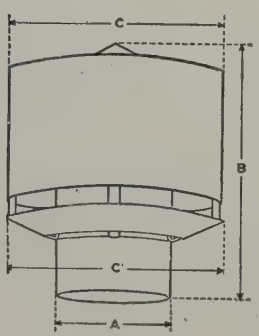
Ventilators Made of Robertson Protected Metal Are Rust Proof and Never Require Painting

Robertson Ventilators are made of Robertson Protected Metal (RPM), copper, galvanized steel, or any other material that may be specified. In cases where ventilators will be exposed to severe corrosive conditions, Robertson Protected Metal is the ideal material.

For ventilators made of Robertson Protected Metal are rust and corrosion proof and never require painting.

Dimensions, Gauges and Weights—As can be seen from the table below, Robertson Ventilators are made in all sizes used in standard practice. You will note, too, that the Robertson Protected Metal or galvanized iron used in each size is of a gauge which assures rigidity, strength and endurance.

Complete erection instructions are forwarded with each ventilator.



Dimensions, in.				Gauge, galv. and RPM	Approximate net weights, lb.		Shipping weights, lb.

Robertson Ventilator Bases

Bases can be furnished with Robertson Ventilators to meet the requirements of any kind of roof. The three types diagrammed below are most commonly used. Types 1 and 3 are made to fit roofs of any slope; in ordering specify roof pitch. Type 6 is made to fit over concrete curbs; in ordering give size of opening and curb. Round to square bases are strongest and are shipped unless special construction is ordered.

Typical Robertson Ventilator Bases

Prices and Complete Descriptions

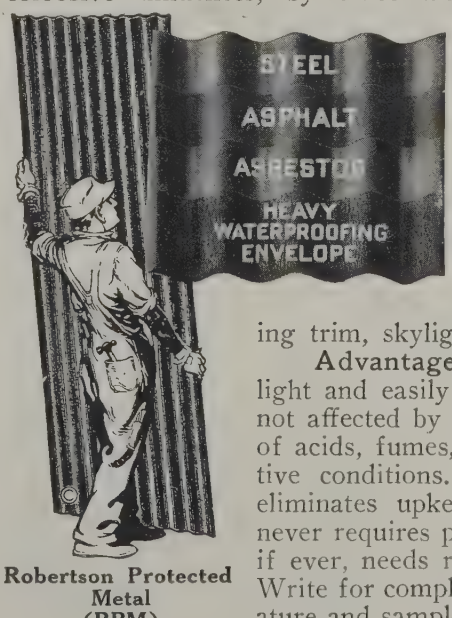
Prices, tables of capacities and complete descriptive data for Robertson Ventilators of all sizes will be sent on request.

Robertson Ventilation Data Book

The 5th Edition (52 pages) of the Robertson Ventilation Data Book contains a wealth of interesting and valuable data on ventilation. So far as we know, it is the first book that has ever been published containing data on ventilation exhaust capacities under every probable combination of severe conditions. An invaluable book for architects, engineers and plant operators. A copy is yours for the asking.

Robertson Protected Metal (RPM)

A metal building material with a steel core, which is fully protected from the most severe weather conditions, smoke, gases, fumes, condensation and all other corrosive influences, by three impervious protective coatings: (1) asphalt, (2) asbestos felt, (3) waterproofing, applied under heat and great pressure. It is made in sheets and bars for use as roofing, siding, downspouts, gutters, general building trim, skylights and ventilators.



Robertson Protected Metal (RPM)

Advantages—RPM sheets are light and easily erected. They are not affected by the corrosive action of acids, fumes, and other destructive conditions. RPM practically eliminates upkeep expense, for it never requires painting and seldom, if ever, needs repairs of any kind. Write for complete descriptive literature and sample of the product.

ROYAL VENTILATOR COMPANY

412 Locust Street
PHILADELPHIA, PA.

Products

Manufacturers of "ROYAL" VENTILATORS of Galvanized Steel, Copper, Toncan Metal, Armco Iron, etc.:

Glass Top Ventilators; Rectangular and Square Ventilators with fire retarding dampers; Smoke Jack and Combination Ventilators; Insectproof and Birdproof Ventilators.

The ROYAL TRADE-MARK (Reg. U. S. Pat. Off.)

Features of "Royal" Ventilators

Actual tests have developed the necessity of the following parts, in combination, for producing the greatest efficiency in ventilators:

The inverted cone
Tapered frustrums
Identical areas of neck and outlet

The above are standard features, embodied in every "Royal" Ventilator. It is not necessary to specify these in ordering; simply

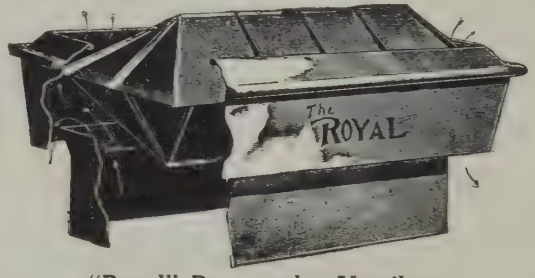
Specify—"Royal" Double Ventilators made by ROYAL VENTILATOR COMPANY, Philadelphia, Pa.

"Royal" Glass Top Ventilator

Contains a greater area of glass, reflects more light and gives more ventilation. Thus a 24-in. has a glass top 29 in. Full capacity of ventilation without interference with light

WITH FIRE DAMPER

Double Cone Ventilator

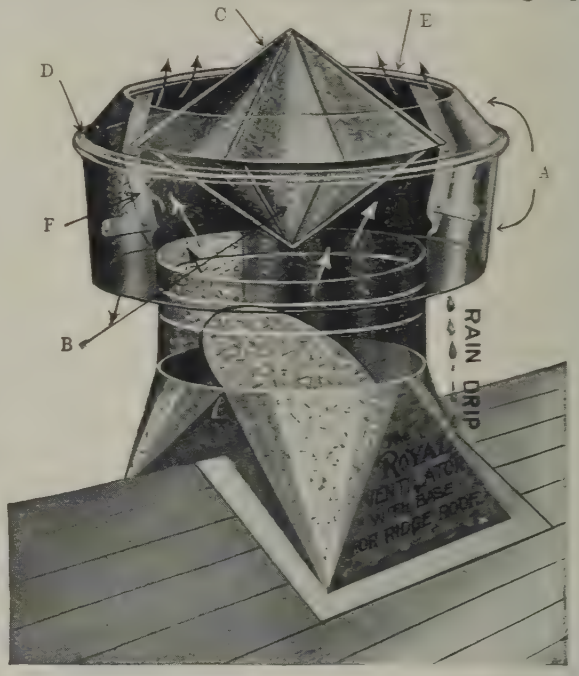


"Royal" Rectangular Ventilator

Designed to meet conditions where the maximum amount of ventilation is required at all times. Made in any desired size, with or without dampers, glass or metal top. Also made square

Construction and Operation of the "Royal" Double Cone Ventilator

The "Royal" is so designed that full advantage is taken of the wind to produce additional draft. Complete renewal of air is accomplished under the most difficult and unusual conditions by installing "Royal" Double Cone Ventilators. The many unique and original principles embodied in the design of the "Royal" make it 100% effective and insure positive ventilation under any weather condition. Tapered frustrums (A) deflect the outer air over and under the edges of the frustrums resulting in a powerful suction in the tube; this means maximum exhausting capacity.



"Royal" Principle, Double Cone Ventilator, 100% Efficient
Bases made to fit any type or pitch of roof

Foul gases, etc., will readily pass out even when no wind is blowing. The inverted or bottom cone (B) of the "Royal" avoids the creation of eddies, the outgoing air having free outlet unimpeded by excess friction. The upward moving foul air, etc., strikes the inverted cone and is drawn directly upward and outward. The "Royal" is not affected by down-drafts. It is adaptable to every type of building.

In the selection of materials and in the construction the greatest care is taken to maintain the highest standard.

Superior and exclusive construction features include lapped seams (D), giving three thicknesses of metal at joints, usually the weakest point. Edgewise braces (F) of malleable iron or copper running the complete length of the ventilator head, wired edges (E) of the deflectors and standing seams (C) in the cones all add strength and durability. The double cone has standing seams and gives two thicknesses of metal instead of one. Made in standard sizes 2 to 96 in.

ESTABLISHED 1909

STANDARD VENTILATOR COMPANY

Manufacturers of "Standard" Rotable Ventilators

LEWISBURG, PA.

DISTRIBUTERS IN ALL PRINCIPAL CITIES

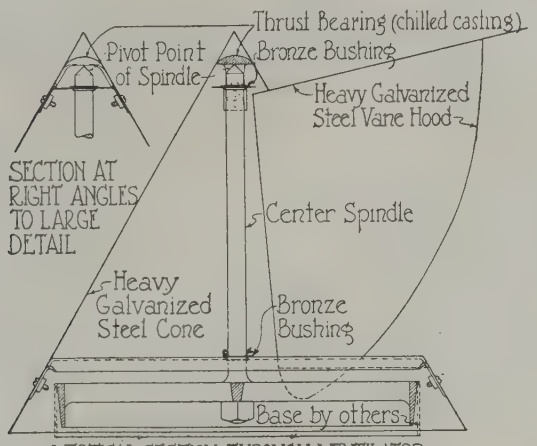
MANUFACTURED IN CANADA BY GEO. W. REED CO., LTD., MONTREAL

"Standard" Rotable Ventilator

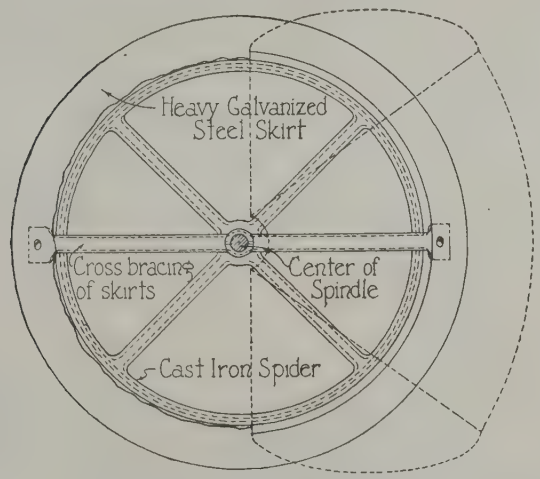
The "Standard" Rotable Ventilator is built in the form of a cone with a vane hooded opening. The cone shape offers least resistance to the wind and gives a greater ease of balance as the wind does not have a flat surface to strike.

The vane hooded opening keeps the mouth away from the wind. The wind passing the mouth induces a siphon effect causing a continual up-draught.

The operation is noiseless and as there are practically no wearing parts it is almost costless.



VERTICAL SECTION THROUGH VENTILATOR



PLAN SECTION THROUGH VENTILATOR

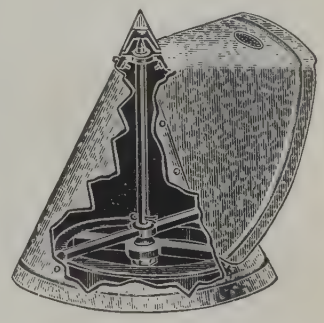
The "Standard" Rotable has been used extensively since 1909, giving complete satisfaction. During this time the manufacturer has been continually experimenting to produce, if possible, greater results and has introduced several new features. The new features, cone tip suspension, bronze bushings and cross bracing of skirt, have resulted in a highly improved ventilator in the following ways: greater durability, greater efficiency, quieter operation and better balance.

Uses—The ventilators are used by factories, schools, garages, public buildings, poultry houses, dairy barns, etc., to carry off gases, smoke, moisture, steam, vapor, foul air, odors, heat fumes and dust.

Body Material—The "Standard" is made of heavy armco ingot iron in gauges of Nos. 22, 24 and 26, according to size.

Pivot Point Spindle—The body of the ventilator turns on the simple pivot point spindle. The slightest current of air will move the ventilator.

Cone Tip Suspension—The entire weight of the ventilator body is carried on a concave thrust bearing nested in the apex of the conical body. This bearing turns upon the pivot point of the stationary center spindle.



Bronze Guide Bushings—Bushings are of non-corrosive bronze. They carry no weight and serve only to keep the body vertical under stress. They minimize the friction and reduce the tendency to screech.

Cross Braced Skirt—The skirt of the conical body is provided with cross brace to increase the rigidity. The lower guide bushing is carried in this cross bracing.

Method of Attachment—The "Standard" is made with round sleeve to slip over the permanent base, or exhaust pipe.

Sizes and Siphoning Rates—Made in flue diameter sizes from 4 to 24 in. and siphoning rates of 30 cu. ft. to 1110 cu. ft. as shown in table.

"STANDARD" ROTABLE VENTILATORS

Opening or flue diam., in.	Gauge iron	Weight, lb.	Minimum siphoning rate per min., cu. ft.*	Code word	List price
4	26	1¼	30	Ruddy	$ 2.20
5	26	1½	50	Rub	2.40
6	26	2½	68	Rotary	2.60
7	26	3	93	Rotate	2.80
8	26	3½	122	Rotula	3.20
9	26	4½	162	Rotund	3.50
10	24	6	201	Rouge	4.20
12	24	8½	272	Round	5.40
14	24	9½	373	Rouse	9.50
16	24	13½	488	Route	14.00
18	24	15	650	Rover	18.00
20	22	20½	804	Royal	23.50
24	22	28	1110	Rope	28.80

*In tests the ventilators invariably show a considerably greater siphoning capacity than the ratings here given. The figures presented here represent the minimum siphoning rate with a wind velocity of 5 miles per hour which is approximately one-half the average wind velocity of the United States.

AGENTS AND STOCKS IN MOST PRINCIPAL CITIES, INCLUDING THE PACIFIC COAST

Swartwout
Rotary Ball Bearing
Ventilators

Products

"SWARTWOUT" ROTARY BALL BEARING VENTILATORS.

Other products manufactured are Hydromatic Steam Traps, Low Pressure Traps, Cast Iron Exhaust Heads, Feed Water Regulators, Feed Water Heaters, Sediment Strainers, Industrial Ovens, Steam and Oil Separators, Air Separators.

Swartwout Principle and Operation

Swartwout principle is very simple. It actively compels the flow of air. Rotating on accurately machined ball bearings, the Swartwout Ventilator always faces away from the wind; the passing breeze continually creates an active suction above the mouth of the ventilator, thus pulling out a steady flow of used air from the room it is connected to.

The entire area of the opening is always efficient. As it responds to every change in wind direction made possible by perfect bearing, no part of the ventilator is ever inoperative. The wind always blows past, never into, the ventilator.

Swartwout Rotary Ball Bearing Ventilator

Standard Type—Made of rust resisting galvanized Armco ingot iron sheets or special metals, of ample gauge, on a framework of sturdy angle iron, coated after accurately forming and punching. Built for lasting resistance, it is practically indestructible.

Bearings on all ventilators are bronze, all large size to insure correct balance, and practically frictionless. No grease or oil is necessary, which is a valuable feature.

Operates easily and effectively. Only one right angle turn is required for air flow, which is accurately controlled by stormproof louvers or dampers operated simultaneously from within by means of rustproof chains over brass pulleys.

Louver-setting device permits setting of the louvers at open or closed positions. Distinctly efficient without sacrificing appearance and on account of its great capacity, fewer Swartwout ventilators are required.

Air-light Type—The standard construction, except for the substitution (on specification) of a full size, strong, wire glass top for the metal top, providing a combination skylight and ventilator. The top, steeply pitched, is self-cleaning. No obstruction of the direct passage of light is possible.

An Analysis of Ventilator Requirements

For those in whose mind there is still some confusion as to the fundamental requirements in the choice of an efficient ventilator, we offer the following:

(1) Gauge of material in regard to relative overall dimensions and weight.

(2) Quality of material. Select a factory assembled ventilator built to endure, one built of heavy rust resisting galvanized metal or copper sheets with coated interior bracing, non-corrosive bronze bearings and bronze balls.

(3) Completeness. The selection of a ventilator complete with dampers, without additional cost.

(4) Capacity and general design. The years of service given under unusual conditions and the greatest possible capacity consistent with good substantial and practical design must be compared.

(5) Complete, ready for erection.

Testing Ventilators and the Swartwout Ventilator Testing Room for the Use of Architects and Engineers

So many laboratory ventilator tests have been made on identical ventilators in various parts of the country and with such varying results, that we now maintain a testing room, installed under natural conditions, for the testing of ventilators. This room is for the use of architects, engineers and prospective customers.

It is located where the wind has free access to it which avoids unfavorable eddies and uncertain results. It is equipped with the most accurate and reliable instruments obtainable, the measuring instruments being similar to those used in the United States Weather Bureau.

Comparative tests will be made or the reports of various tests of the Swartwout with other ventilators will be given upon application to this company. These tests extend over a considerable length of time and are as accurate as it is possible to make tests of this nature.

Fresh Air Requirements for Various Services

Figures in cubic feet per person per hour from table prepared by Prof. John R. Allen, Department of Mechanical Engineering, University of Michigan:

Workshops and barracks	3000
Office rooms	1800
Schools	2400
Hospitals	3600
Churches and theaters	2000
Dining rooms	1800
Toilets and bathrooms	2400

Capacities and Sizes of Swartwout Rotary Ventilators

For capacities, sizes and data on Swartwout ventilators, see detail drawing on following page.

Standard Specifications for Swartwout Ventilators

All ventilators to be of the rotary ball bearing type [metal top] [glass top] of [galvanized] [copper] metal, all interior members of angle iron, coated *after* forming and punching. Ventilators to turn sensitively on accurately machined special hard bronze bearings, employing bronze balls, and counterweighted on outside. Ventilators to be equipped with outside louver dampers to throw accumulated dirt outside of building, louver to be operated from within by chains over brass pulleys.

Gauge of metal to be THE SWARTWOUT COMPANY, Cleveland, Ohio, standard, as furnished in Swartwout Rotary Ball Bearing Ventilators at regular prices. Top of collar and bottom of hood to be stiffened with cadmium coated angle iron rings. (If desired, give standard gauge for each size, as shown.)

Note: Specifications and data for both ventilators and

Continued on next page

bases will be gladly furnished, on request, in convenient card form to fit your card index.

When specifying, inquiring or ordering, state character and pitch of roof, and whether ventilator will rest on peak or slope of roof.

Determining Proper Ventilator Sizes

The volume of air handled by any roof ventilator is affected by many conditions. Among these conditions are wind velocity, direction of wind, location and sizes of surrounding buildings or other obstructions to free movement of air, inside and outside temperatures, location and size of open windows or doors, and methods of heating.

In planning an installation, it is essential to use a sufficient factor of safety to be certain of complete ventilation at all times. The cost of a few more or larger ventilators is insignificant when compared to the difference between satisfactory and unsatisfactory ventilation. The table in the lower right-hand column is for your guidance in determining ventilator sizes. The actual capacity will, in most cases, be much greater than that shown.

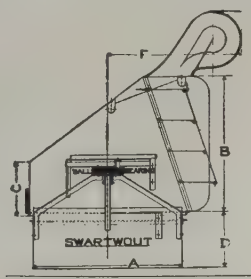
Specifications for Bases

Build each base individually for its job.

Ventilator bases to be of galvanized rust-resisting metal, two gauges heavier than ventilator, according to THE SWARTWOUT COMPANY standard for ventilator bases, and of sizes corresponding to nominal size of ventilators. Collars to be 5 in. high, grooved and riveted to body of base with 1-in. lap and 5-in. spacing. Body of base to be a square-to-round section with opening of the square 4 in. larger than the collar. Bases 18 in. and smaller to be 23 in. high over all, and larger sizes 27 in. high.

All bases to fit roof dimensions accurately with 5-in. flange, bent out, not sharp (if concrete roof, to fit detail shown), and must form an absolutely watertight juncture with the roofing material and be left so on completion. Seams at roofing line can not be allowed, except to fill in corners of base. Top of base to be absolutely level and round.

Note: For capacity, rigidity, tightness, economy, use square bases only.



DIMENSIONS, WEIGHTS AND GAUGES OF SWARTWOUT VENTILATORS

For dimensions, "A," "B," "C," "D," "F," in inches see table below. In ordering, only dimension "A" is required.

INSTALLATION

To insure proper installation and immediate satisfaction, complete directions for mounting are supplied on each ventilator.

A	B	C	D	F	Gauge iron	Wt. copper, oz.	Net wt., lb.	Crated wt., lb.

The Swartwout Standard Ventilator is constructed of heavy gauge galvanized armco ingot iron. Also copper, lead clad steel or special materials

All joints are double seamed. No bolts used

All interior members coated after forming and punching

Accurately machined bronze bearings revolving on bell-metal balls. No oiling necessary

Vane keeps ventilator in proper direction to wind, preventing back-draft and leakage of snow and rain

Full area opening; no restrictions

Adjustable louver damper with ratchet attachment and chain

THE V-W VENTILATOR COMPANY

Manufacturers of Roof and Window Ventilators

2834 A. I. U. Building, COLUMBUS, OHIO

REPRESENTATIVES

BOSTON, MASS., Ernest W. Lowell, 11 Beacon Street — PITTSBURGH, PA., B. A. Geier, 507 Larimer Avenue

DETROIT, MICH., F. T. Schreiner, Jr., 3772 West Euclid Avenue

V-W Siphon Roof Ventilator

Type "A" Ventilator—V-W Ventilators are designed on true siphon principle. They are effective in all buildings where it is necessary to draw out gases, such as foul air, fuels, steam and odors. Regardless of the direction or the velocity of the wind, they exhaust the air continuously.

There can be no back-pressure or down-draft. They have no moving parts; nothing to wear out, stick, rattle or get out of order. The first cost is the only cost.

It is significant that in certain places where the building codes prescribe fan or mechanical ventilation, some building inspectors will accept V-W Ventilators, stating that the latter are always effective, whereas the former are only effective when put into operation by the owner.

These ventilators are being installed on many prominent buildings, including schools, colleges, auditoriums, gymnasiums, libraries, factories, and industrial buildings of every kind.

V-W Ventilators are furnished separately or with the bases.

"WHICHEVER WAY THE WIND DOTH BLOW, SOME HEART IS GLAD TO HAVE IT SO."

Type "B" Ventilator—The regular type of V-W Ventilator has been modified somewhat to meet the requirements for paper and pulp manufacturers. This special type is designed to draw out steam and vapor without permitting condensation inside the building.

CAPACITIES OF V-W ROOF VENTILATORS

From tests performed by A. I. Brown, Professor of Heating and Ventilating Engineering, Ohio State University, and confirmed at Mellon Institute, Pittsburgh, Pa.

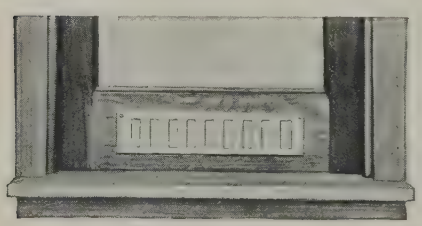
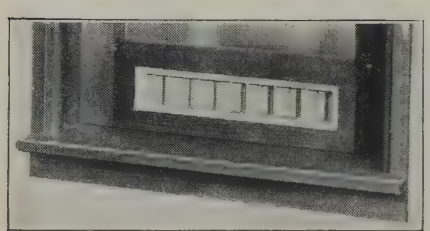
V-W Built-in Sash-rail and V-W Removable Window Ventilators

The V-W Built-in Sash-rail Ventilator—Is built into the lower or upper, or both, sash-rails of the window, with stationary ventilator outside and a sliding shutter on the inside. The ventilator is constructed of V-W patented R-shaped louvers mounted vertically in a frame. These louvers are designed to admit fresh air, without draught, and to keep out dirt, rain and snow.

Ventilation in the room can be controlled by a slight movement of the horizontal sliding shutter on inside of window.



Interior View



Exterior View

Horizontal Section

These ventilators have been found highly efficient in hospitals, hotels, schools, colleges, libraries and office buildings.

Opening sizes: 2 in. x 12 in. and 2 in. x 18 in.

Other sizes can be furnished when ordered in quantities.

The V-W Removable Window Ventilator—The same principle applies in the V-W Removable Type Ventilator as in the Built-in Sash-rail Type.

Palmer Memorial Hospital of the New England Deaconess Association
V-W Sash-rail Ventilators used throughout

This type is made 8 in. high and of various lengths to fit any window opening. Strong springs hold the ventilator in the window channel. The window operates independently of the ventilator.

Sold in hardware, department and office supply stores throughout the country.

For "Anchor-Bar" Rolled Steel, Puttyless Skylights, see page A602.

Van Noorden Vanco-Syphon Ventilator (Pat. Applied for)

The Van Noorden Vanco-Syphon Ventilator is a stationary type roof ventilator. It has an inner cone at the head and a group of scientifically designed syphons around the upper part of shaft. Air currents striking the shaft are sucked into the syphons, and due to the diminishing area of same are compressed so that a rapid syphonage is created. These currents do not enter the shaft. Their movement is up and out, causing a powerful acceleration around the mouth of the shaft. Other currents striking the flaring surface of the inner cone, are similarly compressed and cause an updraft in the center of the shaft.

The Vanco-Syphon Ventilator is stormproof and is equipped with a hinged damper.

Bases — Bases are provided with ventilators only when so required and stated.

Material — Made of sheet copper or genuine galvanized rust-resisting iron.

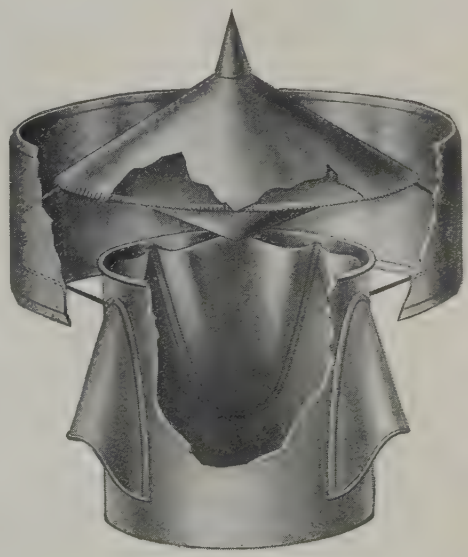
*Based on an average wind velocity of 5 miles per hour.



Vanco Steel Nail-To Buck (Pat. Applied for)

These new, time-saving steel bucks can be handled exactly as though they were wooden bucks. Wood frames and trim can be nailed in the same manner as wood buck. No drilling, tapping or bolting necessary. No shimming of trim.

Another feature is the movable lock anchors and perforated plaster flanges.

They do away with loose frames and wavy plaster lines and, what is very important, they minimize erection labor.

Western Rotary Ball Bearing Ventilators

Western Rotary Ventilators operate on windpower and are designed to revolve at an *effective* speed in a wind of two miles per hour. This means constant, effective operation twenty-four hours per day, as the average wind movement is about six miles per hour. These ventilators furnish a continual change of air, uninterrupted service, *without attention or operating costs.*

Operation—The centrifugal action of the revolving ventilator head, with its scientifically designed louvres, gives the Western Rotary Ventilator a positive, perpetual lift. Foul, hot air is constantly being drawn out, to be replaced through infiltration by cool, fresh air. As a result, there is set up a steady circulation, through which natural action is aided by the mechanical lift of the ventilator head. This produces a venting efficiency that cannot be secured by any stationary device.

Noiseless—There are no whirring fans or buzzing motors; the moving parts of the ventilator revolve on ball bearings, bathed in oil.

Stormproof—Western Rotary Ventilators are so designed that air, rain, sleet, snow and mist cannot enter the ventilator head.

Before installing Western Ventilators on its substation to cool most expensive automatic power equipment, the Pacific Electric Railway Co. made this exacting test: Blue print paper, which is most responsive to moisture, was placed in the base of a Western Rotary Ventilator. It was then left exposed to a driving rain for twelve hours. At the end of that period, not a trace of moisture was visible on the blue print paper.

Manufacturers of Gabelouvres for Attic Ventilation

First National Bank Building, BRIDGEPORT, CONN.

NEW YORK OFFICE, 280 Madison Avenue—Telephone, Caledonia 6644

For Panelouvres, see pages B1474-1476

Gabelouvre—The New Attic Ventilator

The Gabelouvre is a complete ventilating unit, ready for installation, used in the gable ends of any residence or building and assuring easily controlled ventilation for the attic. It admits light and air but excludes rain, snow, birds, insects, etc. The Gabelouvre is also extensively used for ventilating garages, sleeping porches, storage rooms, restaurants, kitchens, and similar places. It makes an ideal adjustable fresh air intake for hot air furnaces. Can be installed by any ordinary workman.

A Gabelouvre in the Gable Ends of a Cottage

The louvres are so designed and built that they pass ventilation equal *to eighty per cent* free area of opening, admit light, but exclude the elements. Is equipped with copper screening to prevent insects from passing through.

It is adjusted for opening and closing by means of pull chains. Standard chain length is 2 ft., but extension chains can be furnished for operation from the floor below.

Construction — The Gabelouvre is made of .050 gauge cold rolled steel with all corners spot-welded and flush. The unit is finished in a special rust preventive which is guaranteed to keep the device from rusting. Then two coats of baked enamel are applied over this, all of which guarantees that the Gabelouvre will last as long as the building.

Sizes—Gabelouvres are manufactured in one standard width, namely 13⅞ in. and in three standard heights, 23 11/32, 17 11/32 and 12 27/32 in.

Cost—The cost is less than an old-fashioned wood ventilator.

BERLOY STEEL CEILINGS and SIDEWALLS in wide variety of attractive designs to harmonize with various styles of architecture and furnishings.

For Floor Cores, see page A122; for Metal Building Material, see pages B1685-1689; for Lockers and Shelving, see pages C3798-3799.

Steel Ceiling Advantages

Briefly stated, the advantages of Berloy steel ceilings are beauty, safety, permanence, fire resistance, bacteriological cleanliness and ultimate economy.

Berloy steel ceilings offer the architect a wide range of styles and period designs suitable for use in residences, churches, theaters, schools, offices, restaurants, stores, lodge rooms, factories, showrooms, markets and other locations where ceilings and walls offering the above advantages are required.

By means of a special type of bead and button construction Berloy plates fit snugly and with absolute accuracy. As illustrated, the top of the nailing button is depressed or countersunk, and forms a self-centering and self-guiding nailing point that directs the nail to its proper position and prevents slipping while being driven. This is a feature of Berloy construction that gives extra strength and rigidity to the entire plate.

Berloy Bead and Button Construction

Berloy Modern Steel Ceilings

Berloy facilities and equipment for the production of steel ceilings are unsurpassed. The finest type of presses and other mechanical equipment contribute to the excellence of Berloy ceilings, and complete control of every manufacturing process from the time the iron ore enters the blast furnace to shipment of the finished product is in Berloy hands.

All Berloy ceiling units are produced on special draw-presses, each possessing a 900-ton pressure capacity. These presses give an accuracy, depth and sharpness of detail impossible to achieve with the ordinary drop hammer method of production. Each unit is an exact facsimile of all other units of the same style and design.

Back of the presses and other equipment that reproduce the beauty and character of Berloy designs are Berloy's own furnaces and rolling mills that aid in making the Berger plant one of the largest sheet metal works in the world.

This control of all steps in production enables Berloy to regulate its output according to market conditions and, further, serves as a guarantee of economical operation and the prompt filling of all orders, either from the main plant at Canton or the numerous branch warehouses throughout the country.

Berloy Designs

Berloy steel ceilings are made in beautiful and practical modern designs. These designs are made in wide variety to offer a range of choice for every service.

Various types of cornice border and field plates can be combined to form an endless variation of finished effects. Many of the best combinations are clearly illustrated in the big Berloy Catalogue D27 which will be sent to any architect on request to the nearest Berger Office.

Berloy Steel Sidewalls

Steel sidewalls are sometimes desirable and a variety of practical and attractive modern Berloy designs are available for the purpose.

Popular Priced Plates

For garages, lofts, basements, factory rooms and similar places where the more artistic designs are not required, Berloy popular priced ceiling and sidewall plates can be used with a considerable economy both in cost of ceiling material and in erection costs.

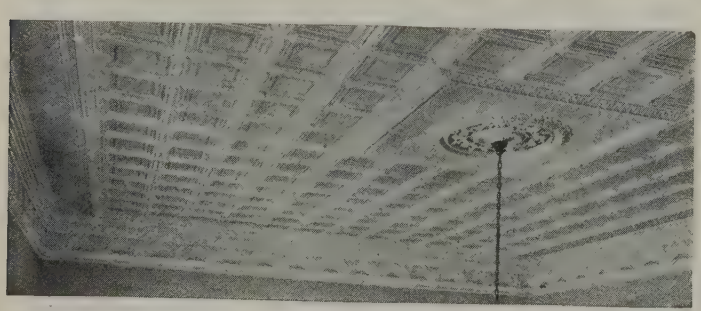
Directions for Applying Berloy Steel Ceiling and Sidewall

Before commencing the application of material, verify all measurements and study carefully the working plans.

Working Plans—Proper working plans are supplied, which are prepared from information and measurements furnished.

Our plans will show in detail the exact location of every piece of material. It is very important that the constructor carefully study the working drawings, and same should be thoroughly understood before commencing the work.

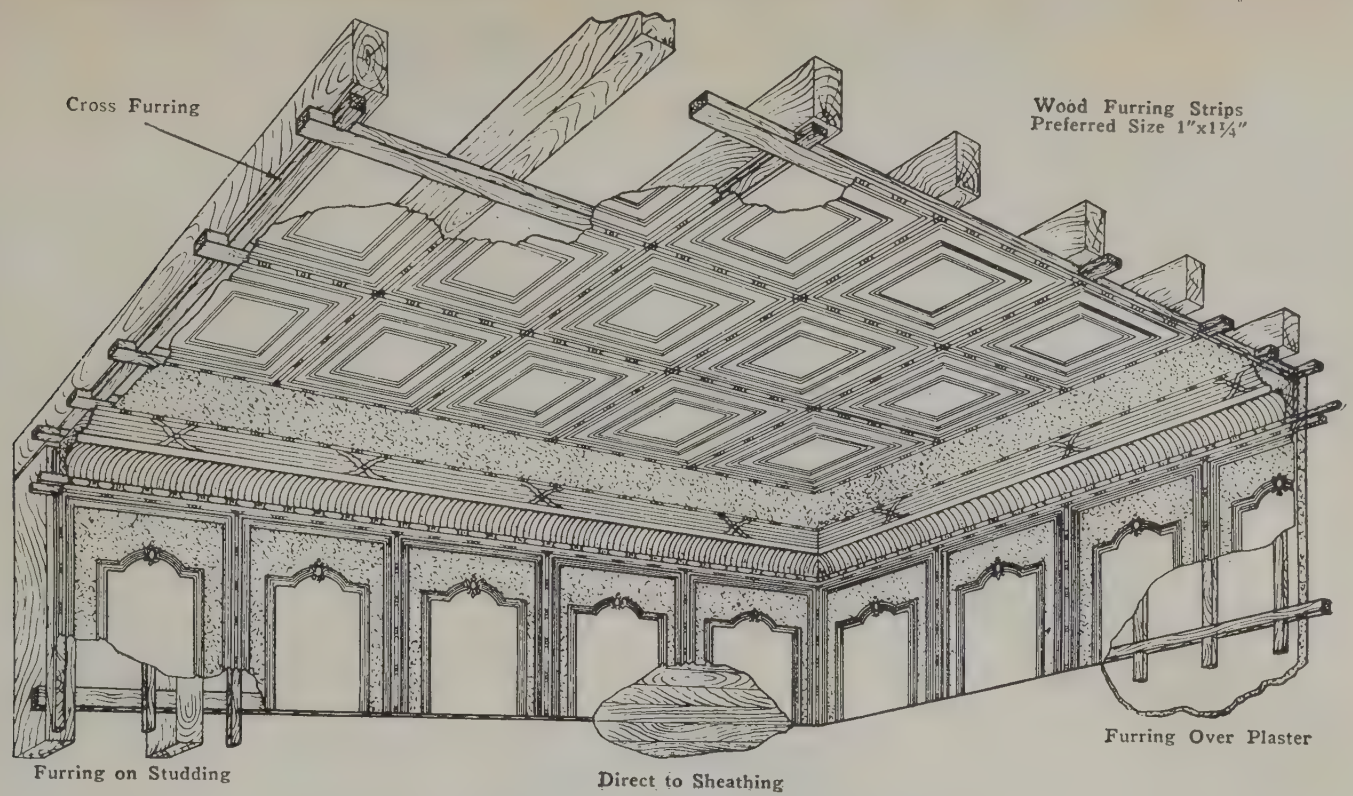
Leveling of Joists—With a straightedge it can be determined whether furring down or leveling is necessary. This may be accomplished by nailing to the side of joists a strip of necessary thickness, or by setting wedges, as may be required, after ceiling furring strips have been leveled.



Berloy Metal Ceiling in Masonic Temple, Wilmington, Ohio

Berloy Ceiling in St. Clement's Church, Minneapolis, Minn.

Continued on next page



Details of Application for Berloy Modern Steel Ceilings

It is absolutely essential that furring strips lengthwise and crosswise of the room are centered exactly to the center of nailing points on ceiling plates.

From both ends of the room at points indicated on working plan as "starting line," strike a chalk line; this establishes a starting line from which to work.

For Continuous Ceilings—Use the following rule for placing of wood furring strips: Place the first wood strip on starting line, and parallel to the same place additional strips 12 in. on centers for plates of 6 or 12-in. multiple, and for such 24-in. multiple plates which are not sufficiently rigid to carry their own weight without buckling or sagging. For all 24-in. multiple plates place strip 24 in. on centers. Cross furring or headers must be inserted at the end of each plate whether same be furnished in 2, 4, or 8-ft. lengths. This method of furring excels methods formerly practiced, because it provides a solid foundation or backing for all nailing points and requires a smaller quantity of strips; also reduces to a minimum the labor required in the application of the materials.

Furring should always be placed at right angle with joists; cross furring or headers parallel with joists.

Should wood strips be furnished in connection with metal ceilings, the necessary amount required will be based on the above method of construction.

For Panel Ceilings (Sunken Panels)—Parallel to the first strip placed on starting line through the room, place additional strips according to the width of panels used. Cross furring strips or headers must be placed at the end of each panel or last multiple thereof. For example, if the panels are in sheets 4 or 8 ft. long, cross furring is necessary at the end of sheet only. Furring strips lengthwise and crosswise the room are to be centered exactly on the center of nailing points in ceiling panels or plates.

Cornices and mouldings are to be applied with the use of wood brackets furnished for that purpose, as shown by working drawings; one wood bracket to every 4-ft. section of cornice or moulding, and extra brackets for miters and connections. Brackets are used under laps only.

All cornices and mouldings should be applied to a chalk line so that the finished work may be absolutely straight and accurate.

Nail the foot of the cornice in position before nailing the top edge, so as to provide for the underlapping of filler if necessary. Stamped miters for inside and outside corners are furnished for certain coves and cornices, and can be used for right-angle miters only. Stamped miter leaves for inside and outside corners are furnished for certain coves and cornices, and may be used for irregular-angle miters.

For certain coves and cornices both stamped miters and leaves are furnished. For all other coves and cornices the ceiling constructor will make or cope the necessary miters as the work proceeds. Working plans always indicate width of border, moulding, filler, and projection of cornice, and this will guide the constructor in spacing furring strips to receive same.

Strike a chalk line in center of strip or starting line for guidance in placing the plates or panels perfectly straight and true.

Always commence the application of material at rear of room and work forward, when possible.

Steel Sidewalls—The foregoing rules also govern in the application of steel sidewall material, for which furring strips are required when the work is done over plaster or studding; we, however, recommend the use of close sheathing for all continuous plates. When sunken panels are used, furring strips must be used of a size to carry the depth of panel.

If metal wainscoting is used, this should be applied first, then such other material as working plan calls for to make the finish above wainscoting.

Care should be taken to keep the work straight and true.

Sufficient allowance for cutting, underlapping, and wastage will be provided for.

Wood Furring Strips—Furring strips of ⅞x⅞-in. size are very satisfactory when working over plaster, but experienced ceiling constructors, when working over joists or studding, prefer ⅞x1¼-in. size; they are less liable to split, and provide a rigid foundation for the nailing of metal; especially is this true when toenailing headers or cross furring in position.

Wood furring strips are never provided for unless specifically ordered; then same are charged for extra, because users of this class of material can usually purchase in their own city or vicinity the necessary furring strips at satisfactory prices and save freight charges.

Wood furring strips of ⅞x1¼ in. weigh about 18 lb. per 100 lin. ft.

Estimates, Drawings and Literature

The corps of experienced Berloy Ceiling Draftsmen is at the service of any architect in planning the use of Berloy steel ceilings and sidewalls, with estimates of cost.

This service is free to architects. Send sketch and exact dimensions of room, state height of ceiling, indicate preference as to style or design of ornamentation desired, with any other information which will assist our ceiling experts in meeting your desires. Address nearest Berger Office for catalogues and any information desired.

Steel Ceiling Users

RIESNER VENTILATING BRICK. (Pat. Jan. 5, 1926.)

Riesner Ventilating Brick

Description—A ventilating brick, made of cast iron or bronze with galvanized iron flue, the size of a standard brick, having a louvered face with waterdrip at top and bottom.

Three Types—*"Type A"* transforms to a 3-in. diameter flue and has a 3-in. brass collar as inside of wall.

"Type B" carries through wall with a 2x8-in. duct and has a register face at inside of wall.

"Type C" transforms to a 6-in. diameter flue and has a 6-in. brass collar at inside of wall.

All types are 13 in. from louvered face to inside of wall. Ventilating bricks required longer or shorter than 13 in. can be made specially.

Construction—Made of cast iron with galvanized iron flue or bronze with copper flue.

Where Used—These ventilating bricks are especially suited for use in kitchens, kitchenettes, pantries, closets, hung ceilings, attics, cellars, mausoleums, bathrooms, utility rooms and clothes closets for schools.

Advantages—Does not take up any room, *it is bricked into the wall.*

Particularly useful in kitchens to remove gas fumes, steam cooking odors and foul air, where there is no room for vertical vent shafts and bulky ventilators.

When kitchens are properly ventilated and gas fumes, steam and cooking odors removed, the walls do not discolor and kitchens do not require painting as often.

Weatherproof, Durable, Economical—Riesner Ventilating Bricks are absolutely weatherproof by their design, durable because of the material used, and economical—for the first cost is the only cost.

Installation—The ventilating brick is "bricked" into the wall by the mason as the wall goes up, 6 in. below the ceiling line with the louvered face to the outer air and flue or register face in the room.

Specifications—Specify under masonry heading: "Install Ventilating Bricks as manufactured by BENJAMIN RIESNER, INC., 260 East 78th Street, New York, N. Y., in the wall 6 in. below bottom of ceiling beam." (Specify type, where brick is to be installed, and whether cast iron or bronze.)

Prices—***"Type A"***—Cast iron 13 in. long with 3-in. diameter brass collar, $5.50 each, net f.o.b. New York, N. Y.

"Type B"—Cast iron 13 in. long with 2x8-in. register face, $6.50 each, net f.o.b. New York, N. Y.

"Type C"—Cast iron 13 in. long with 6-in. diameter brass collar, $11.50 each, net f.o.b. New York, N. Y.

Note: Cast bronze prices on application.

BETHLEHEM STEEL EXPORT CORPORATION, 25 BROADWAY, NEW YORK, N. Y.
Sole Exporter of our Commercial Products

Products

BETHLEHEM WIDE-FLANGE STRUCTURAL SHAPES, including GIRDER BEAMS, I-BEAMS and H-COLUMNS; BETHLEHEM JOISTS and STANCHIONS.

Uses

Bethlehem Girder Beams and I-beams are used in buildings, short-span bridges and as bridge floor beams; H-columns, in all sizes of buildings and bridges; joists are used especially for floor construction in buildings designed for lighter floor loads; also in the roof construction of all types of buildings; stanchions are used as columns or posts in connection with Bethlehem Joists.

Advantages

Bethlehem Wide-Flange Structural Shapes, commonly known as Bethlehem Sections, are rolled on Bethlehem's Patented Grey Mills. These sections combine the advantages of economy in weight and cost of fabrication.

AMERICAN ROOF TRUSS COMPANY

WM. H. WADDINGTON, President

TELEPHONE
FRANKLIN 1720, 1721

Engineers and Constructors of Roof Trusses

5 North La Salle Street, CHICAGO, ILL.

NEW YORK OFFICE: 101 Park Avenue

Products

Manufacturers and erectors of AMERICAN WOOD BOWSTRING TRUSSES for public garages, service stations, machineshops, warehouses, schools, banks, gymnasiums, bowling alleys, aeroplane hangars, grandstands, dance halls, and other buildings requiring clear floor space.

Span and Spacing

Trusses designed for 25 to 150-foot spans. Spacing is usually 16 to 20 feet on centers, depending on length of building.

Height at Center and Ends

The standard height at the center on all spans is one-eighth of the length of the truss. The height of the ends is governed by the size of the lower chord timbers varying from 6 to 12 inches according to span and loading.

Service, Strength and Safety

Trusses are built on the job by us and erected in place as soon as pilasters are up, completely installed, ready for roof joists, anywhere in the United States. Designed according to local building requirements, material No. 1 yellow pine or structural fir of highest grade assuring strength and safety. All trusses guaranteed.

Information Required for Estimates

(1) Number of trusses required.
(2) Span out to out of walls or center of columns.
(3) Spacing between trusses.
(4) Loads. Regular roof load in pounds per square foot. State if any ceiling load. For unusual loading conditions send plan or photostat.
(5) Address of job, nature of building, owner's and architect's names.

Specifications

Roof trusses shall be American Wood Bowstring trusses furnished by AMERICAN ROOF TRUSS COMPANY, 5 North La Salle Street, Chicago.

Literature

Send for illustrated folder and valuable suggestions covering economical layout and brick saving features.

Our engineers will give fullest co-operation to architects.

ARCH ROOF CONSTRUCTION CO., INC.

TELEPHONE
WISCONSIN 5845

Engineers and Contractors
104 West 42nd Street, NEW YORK, N. Y.

Products and Service

Design, Construction and Erection of LONG SPAN ROOF ARCHES for public garages, auditoriums, convention, exhibition and fair buildings, warehouses, theaters, factories, airplane hangars, gymnasiums, bowling alleys, skating rinks, and all buildings where unobstructed space, maximum light and ventilation are desired.

ARCH ROOF CONSTRUCTION CO., INC., will design the arches, supply all materials and do the erection, or ordinary materials can be supplied and erection done by local contractors.

Construction and Materials

By using straight lengths of the usual structural materials combined with special connections, a practical way has been evolved of applying the arch principle with its beauty and great strength to the economical construction of buildings having spans up to *300 ft.* or more, where unobstructed space is desired.

Columns, posts and trusses are eliminated with this construction, and a clear interior giving a maximum amount of light and ventilation obtained.

Strength

Arch roof construction can be of timber or steel or a combination of both. Standard structural shapes and sizes are employed in a patented design with patented connections to produce a roof of unusual strength. It may be fireproof, fire-retarded or non-fireproof.

While designed for ordinary roof loads of 40 lb. per sq. ft., in a test by Columbia University it successfully carried a uniform load of 80 lb. per sq. ft. and then, for an unsymmetrical test, half of the sand on one-half of the arch was removed. This loading was considerably increased when the sand absorbed about 2 in. of rain, and also by the effect of wind at velocities from 48 to 70 miles per hour on this open structure. This test was made while building was in course of construction, unenclosed, with only part of roof in position.

Advantages of Arch Roof Construction

Maximum strength and long life. Unobstructed light and ventilation. Sidewalls of brick, wood sheathing, sheet iron, canvas, or folding or rolling doors. Full use of all floor space. Economy of material and labor. Temperature economically warm in winter and cool in summer. Reduced fire hazards, ease of controlling fires and low insurance rates. Added dignity, distinction and character to all long span buildings. Can be dismantled and erected with 100% salvage. Adaptable to practically every type, style and size of building.

Queens County Motor Vehicle Dealers' Association Exhibit
Arch roof construction permitted free use of all space for exhibition purposes and provided a place large enough for the complete display

Airplane Hangars

Arch Roof Construction is particularly suitable for use in airplane and dirigible hangars. We are in a position to design and/or construct hangars of all kinds.

Engineering Service

ARCH ROOF CONSTRUCTION CO., INC., will co-operate with architects, engineers and contractors in planning the most economical and efficient design for particular buildings.

A request will bring additional information.

Lamella Roof Construction

The Lamella unit system of roof construction has been developed to meet the widespread demand for a simple and reliable type of long span roof construction. which can be built at a reasonable price. It is especially suitable for garages, theaters, exhibition and fair buildings, churches, hangars, armories, and similar enclosures where high clearance or large areas of uninterrupted floor space must be housed. Single spans run as wide as 130 ft. and in any length desired.

Lamella Unit

The Lamella unit is an especially designed timber unit, with beveled ends, bored for bolted connections, and a top curve to suit the radius of the finished roof.

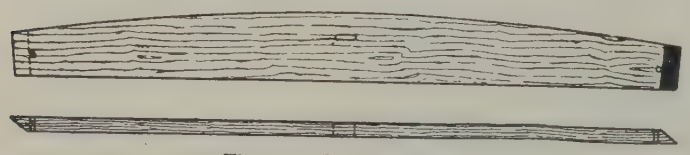

Fig. 1. Lamella Unit

Material

The quality of lumber used for Lamellas is No. 1 common. The strength and the price of the lumber control the kind to be selected, such as long leaf yellow pine, short leaf yellow pine, Douglas fir (Oregon pine) and others. The Lamellas can be manufactured at any planing mill equipped with a circular saw, a band saw and a boring machine.

Assembly

These units are assembled by bolting together, using standard machine bolts and nuts and special washers. It will be observed that lateral shrinkage of the timber after erection has no effect on the alignment of the joints. A netlike construction results, which may be developed into four principal types of arch roofs as follows:

(a) *The Flat Segmental Arch Roof, Fig. 2,* the thrust of which is taken up by tie rods. This is used largely for garages, factories, car barns, hangars and various kinds of industrial buildings. The rise of the arch is about one-sixth of its span.

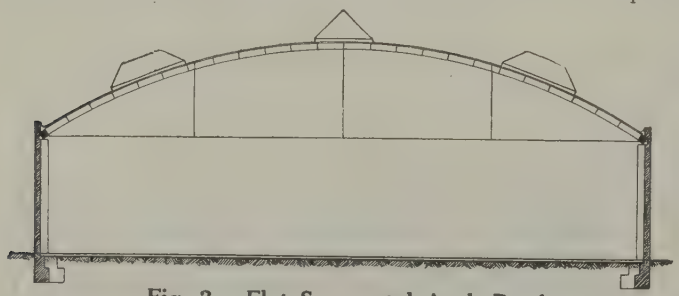

Fig. 2. Flat Segmental Arch Roof

(b) *The Segmental Arch Roof,* the thrust of which is taken up by buttresses, concrete piers or wooden bents (Fig. 3). This is especially suitable for warehouses and exhibition buildings.

(c) *The Gothic Arch,* especially suitable for churches, residences, barns and warehouses where goods are stored in bulk, such as grain, ore, etc. The Lamella roof construction may start at the ground.

(d) *The Broach or Circular Roof,* used principally for exhibition buildings where a particularly architectural design is desired.

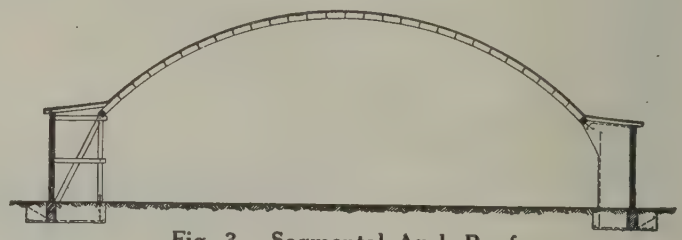

Fig. 3. Segmental Arch Roof

Economy

Lamella construction is built up from short length timber which can easily be obtained and handled. Due to its unique arrangement it takes care of all engineering requirements in an ingenious but simple manner. On account of its highly standardized nature the erection itself is merely an assembly proposition. All these factors co-operate in reducing the costs and inaccuracies of erection.

Safety

Accidental damage to Lamella members can readily be repaired, and even if units are destroyed the stresses will be carried by the surrounding network. The great flexibility of the system results in a particularly tenacious and enduring structure, which will absorb and distribute severe concentrations of loading.

Safe Loads

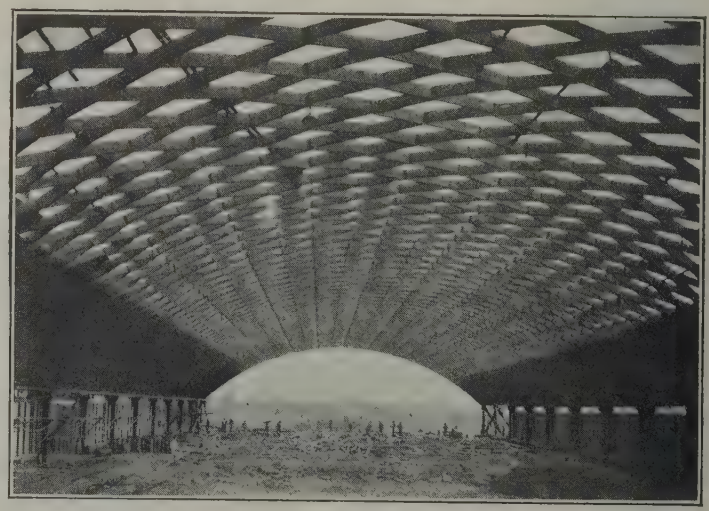
The safe loading of Lamella systems has been very carefully worked out, checked and confirmed by tests and practical construction throughout the United States and abroad. Any licensee of the company will make recommendations as to sizes and types of construction for any loading at any factor of safety. Extremely high wind loading may be carried and we have built structures carrying a 6-ft. snow load.

Fire Resisting Qualities

In Lamella construction there are no trusses, girders or columns to carry fire from the floor and distribute it along the roof. There are no trusses or ribs under concentrated load, the failure of which by fire might cause the collapse of the entire structure. The load carrying members are spread over a great area and are correspondingly hard to destroy.

Architectural Qualities

Lamella roofs allow a maximum utilization of the enclosed space. Distribution of light is not impeded by purlins and trusses. When sheathed on both sides a remarkable insulating



Riding Academy, St. Louis, Mo., 120-ft. Span

Continued on next page

Interior of National Democratic Convention Hall, Erected in Record Time to House More Than 20,000 People

When the city of Houston secured the National Democratic Convention, there were no facilities to house such a large audience. The problem the architects had to solve was to build a huge auditorium within a short time, which would provide a large floor area unobstructed by columns, of best acoustical qualities and pleasing appearance at a reasonable cost. They selected Lamella and twenty-seven days after receipt of the order, this construction was finished. The measurements are, center span 120 ft., side spans 76 ft. each, total height at center 60 ft., and spacing of columns 40 ft. 9 in.
Architects: Kenneth Franzheim, New York, and W. A. Dowdy, City Architect, Houston

quality results, as the air spaces are small in area and entirely separated, preventing the excessive heat transfer in the long channels between double sheathed purlins and joists.

Lamella roofs are symmetrical and of sweeping graceful design. They lend themselves to a wide range of architectural treatment.

Salvage Value

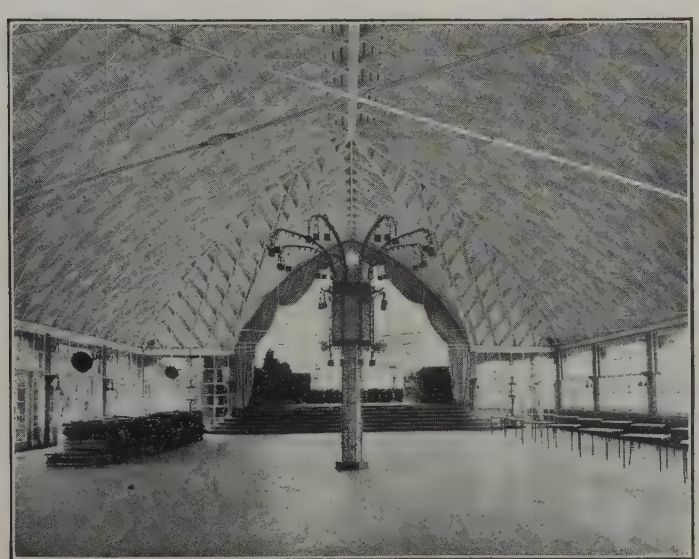
Unit construction of this type has unexcelled salvage value. Temporary buildings may be dismantled and re-erected with a minimum of loss—an unusual and most valuable feature for timber construction.

Data Required for Estimates

(1) Type of roof (a, b, c, or d).
(2) Outside measurements of building and exact information in case building is not rectangular.
(3) Height of springing line above ground or upper floor and rise of arch desired.
(4) Loading required in pounds per square foot; give required live and dead roof load (exclusive of Lamella construction); ceiling load if any. If roof carries any concentrated loads such as balconies or cranes, submit plans.
(5) Sizes and locations of skylights.
(6) Location of job.
(7) For roofs *without* tie rods (Types b, c, and d) give the following additional information:
(a) Kind of supports (buttresses, wooden or steel bents).
(b) Height, width and spacing of supports.
(c) Bearing capacity of soil and whether building is on property line.

Specifications

Roof construction shall be "Lamella Roof" to be built and erected or furnished by the Lamella Roof Syndicate, Inc., 45 West 45th Street, New York, N. Y., or a licensed agency.



Lamella Roof for Breakfast Club, Los Angeles, Cal.

THE MACOMBER STEEL COMPANY

Massillon Steel Building Products

901 Belden Avenue, CANTON, OHIO

Products

MASSILLON ROOF TRUSSES and TRUSS BRACING.
"H" COLUMNS and STEEL FRAMING.
STEEL DOORS and STEEL WINDOWS.
STRUCTURAL and REINFORCING STEEL.

For Massillon Bar Joists and Massillon Nailer Joists, see pages A672-673; for Massillon Vault Reinforcing, see page A1342.

Type of Products

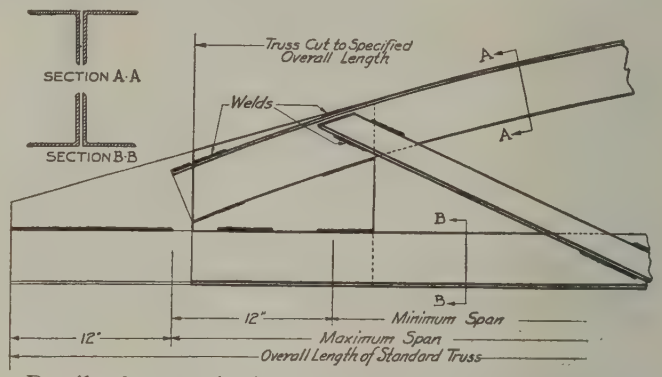
Through the use of patented Massillon features, structural building products are manufactured in standard stock sizes for prompt shipment on all orders. These products are readily designed into buildings by architects or engineers. Complete structural layouts for erection purposes are furnished as a part of the service and submitted for approval to the architect or engineer designing the building. Complete stocks of steel windows, metal lath and structural and reinforcing steel round out this service.

Bar Joists for fireproof floor and roof construction; Nailer Joists for semi-fireproof construction; and Vault Reinforcing for banks and financial institutions are covered in separate pages as noted. These products and the products covered here are widely used and specified as component parts of practically all types of buildings.

The full use of Massillon Service permits the architect to plan and design industrial buildings to meet the individual needs of his clients at costs competitive with the less desirable "Standard Buildings." Prompt shipment of Massillon materials and ease in designing with any type of wall and roof construction has resulted in an ever increasing demand for Massillon Products for this field.

Massillon Roof Trusses

The Massillon Roof Truss (U. S. Patent No. 1678738) is essentially a steel roof truss built up with double angle top and bottom chords and fabricated with modern electric arc welding. Loading Tables (A.I.S.C. Specifications) and overall dimensions for stock size curve chord trusses are listed in adjoining tables. "A" type trusses are handled in the same manner. These stock size trusses are designed into buildings as easily as simple beams. The trusses should be spaced to develop their full carrying capacity for maximum efficiency.



Detail of a standard truss end is shown above. Trusses may be cut to specified overall length to suit the framing conditions. Shorter trusses are shipped in one piece. Longer trusses are fabricated, match marked, and knocked down for shipment in sections for ease in handling and erecting on the job. Holes for field connections are reamed to $\frac{1}{64}$ in. clearance in fabricating and fitted with turned bolts. No metal less than $\frac{1}{4}$ in. in thickness is used.

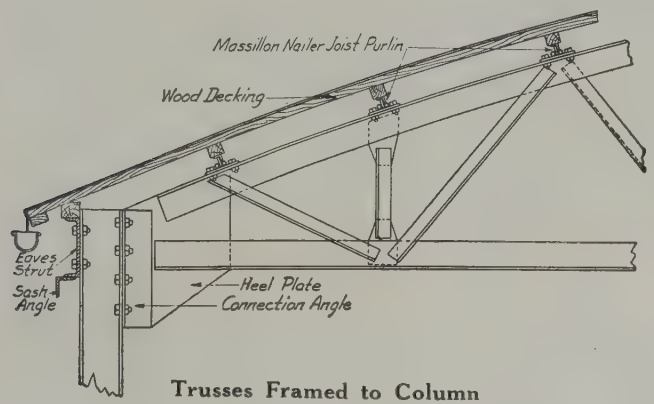
Truss Bracing

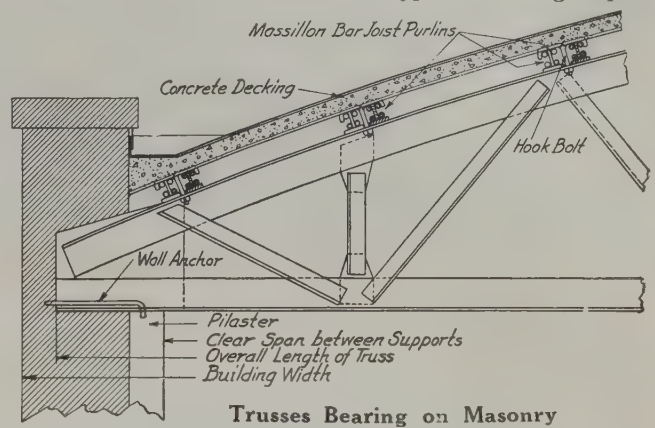
Good practice calls for truss bracing to line up and hold the trusses in place during the erection period. Trusses in buildings with longer spans should be braced to transmit and transfer wind stresses. Three standard forms of Massillon Bracing are provided to take care of practically every condition. Special bracing is provided for special conditions not covered by standard designs.

Truss Framing Details

Trusses may be framed into steel columns, or rest on steel columns or masonry pilasters. Where they are framed into steel columns, the trusses are cut to the clear span between columns and provided with special heel plates and connection angles. Trusses that rest on steel columns are punched for bolting or riveting to the column cap. Knee bracing is often required to stiffen the columns and the trusses are punched for this detail where specified. Trusses bearing on masonry pilasters are punched for insertion of wall anchors. Truss bracing connections are detailed to suit the type of bracing required.



Trusses Framed to Column

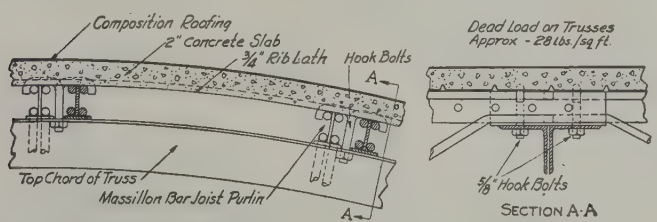


Trusses Bearing on Masonry

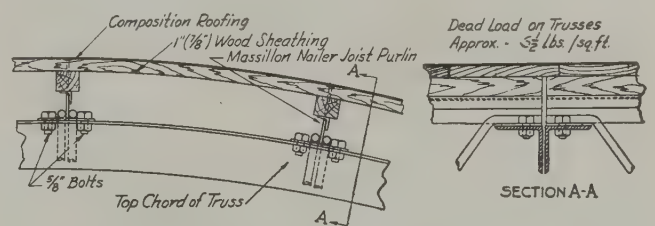
Roof Purlin Framing

Any type of purlin construction such as channels, wood rafters or Massillon Type Purlins may be framed to the trusses. The top chord angles of the trusses are punched standard with $\frac{11}{16}$ in. holes 2-6 in. on centers for attaching wood nailing strips where wood purlins are used. The exact punching of top chord angles for bolting other types of purlins is detailed to suit the spacing of the purlins.

Massillon Bar Joists are recommended where concrete or steel roof decking is specified. Massillon Nailer Joists provide an economical construction with 1-in. wood decking for all spacings of trusses. Massillon Roof Purlin Sections are Nailer Joists in a heavier and deeper form for efficiently carrying 2-in. wood decking. All of these products are bolted to the trusses. Where specified for roofs with steep pitch, sag rod plates and sag rod bracing are provided. Wire cross bridging is used on flat or curved roofs.



Concrete on Bar Joists



Wood on Roof Purlins

"H" Columns and Steel Framing

Steel, masonry or concrete columns may be used in the side wall construction for supporting the trusses. Massillon "H" Columns are built up from standard "H" sections with standard cap and base details. They take up less room and usually prove more economical. The proper size "H" section may be taken from any structural handbook. Standard details are provided for wall framing such as eave struts, girts, lintels and column bracing for skelton frame buildings. All are detailed to meet the requirements of the building.

Steel Doors and Steel Windows

Heavy type steel doors are built in standard sizes for airplane hangars and industrial buildings. This includes all hardware, guides and supporting frame work.

Steel windows are carried in stock sizes for prompt shipment. This includes all standard commercial, industrial and residential types.

Structural and Reinforcing Steel

Complete shop facilities are maintained for fabricating structural and reinforcing steel. This service is used to advantage in consolidating the responsibility and orders for requirements to be shipped with Massillon Trusses, Columns, Joists, Windows and our other standard products.

Metal Lath and Lath Accessories

All types and sizes of metal lath, lath accessories and reinforcing fabrics are carried in stock for prompt shipments for all requirements.

Typical Installations

Massillon Bar Joists are widely used for fireproof floor and roof construction; Nailer Joist for semi-fireproof floors and roofs.

Roof Trusses over school gymnasiums, in auditoriums, theatres, garages, etc.

The complete steel requirements, including the doors, are furnished for airplane hangars, garages and industrial buildings.

Scope of Service Available

A.I.A. designing data catalogues are printed on all standardized products. The products are marketed through engineering representatives in all principal cities. Recognizing the tax on an architect's time, no general sales calls are made except on invitation. However, Massillon Representatives are available in or near principal building centers to co-operate in preparing definite recommendations and estimates. Complete erection plans are regularly furnished on all orders as a part of our service.

ESTABLISHED 1894

McKEOWN BROS. COMPANY

Builders of Wooden Roof Trusses for All Types of Buildings

5235 South Keeler Avenue
CHICAGO, ILL.
TELEPHONE, VIRGINIA 2010

21 East Fortieth Street
NEW YORK, N. Y.
TELEPHONE, LEXINGTON 10400

Products

Builders of WOODEN ROOF TRUSSES and ARCHES of all types.

Experience

MCKEOWN BROS. COMPANY has been in continuous operation since 1894 designing and building roof trusses of wood.

Service

This company is not an architectural organization, but desires to assist architects, engineers, owners, builders and manufacturers in all matters related to the use of wooden roof trusses. Although we do not furnish building plans, we will gladly co-operate in securing economical and efficient layouts for all projects.

Our work in this line has given us experience in solving practically all questions attendant to the use of trusses. We invite inquiries of all kinds relative to their use and related problems, which will be promptly answered by our engineers. On special trusses we would be glad to furnish the architect with sketches of trusses upon receipt of information which would be required for making a design.

Construction

We contract for the construction and erection of trusses to be built upon the site of the job. In this case all material and labor is local, but one of our experienced superintendents directs the work.

We contract for the furnishing of trusses f.o.b. site of job. These trusses, after fabrication in the shop, are shipped in sections easily handled and assembled. Each section is marked to conform with markings on detailed drawing furnished so that they can be assembled by unskilled labor.

Data Required for Estimates

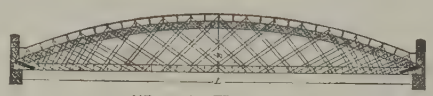
As all trusses are built to exact measurements, it is necessary that we be furnished with:

(1) Number of trusses required.
(2) Over-all length of trusses.
(3) Distance between trusses.
(4) Loading conditions, regular roof load, and ceiling load.

The above is all of the information needed to submit estimates on roof trusses for ordinary buildings. If the project requires trusses which are to serve a decorative, as well as a structural purpose, it is advisable that we be furnished with plans or sketches of the building showing the type of truss and the ornamental features desired.

Bowstring Trusses

Built to span from 25 to 150 ft. for any spacing and any loading. The material used is never less than 3 in. System of webbing is optional

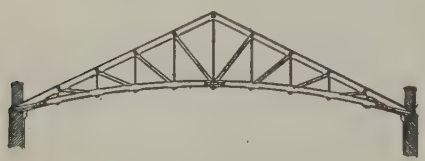


"Lattis-Trusses"

Built of materials having a minimum thickness of 2 in. The interlacing web system furnishes unusual strength and provides for stress reversals

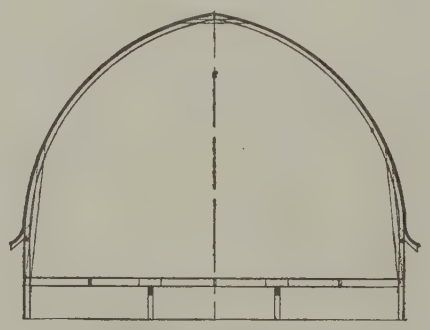
Crescent Trusses

Have a curved upper and lower chord, and are economical trusses for use in buildings where additional headroom is required without increasing wall height



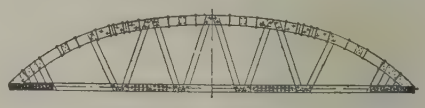
Howe Trusses

For buildings requiring mill type construction roofs, flat or pitched, can be had in ordinary construction, or mill sections



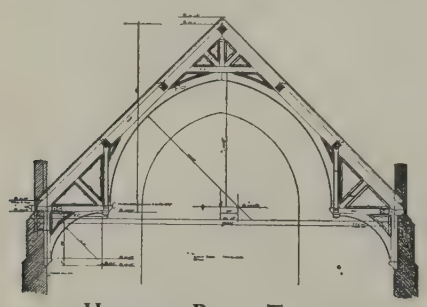
Ribs for Gothic Barns

Furnished with solid sections and built to exact curvatures



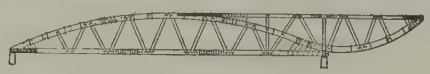
Multi-Radii Trusses

For centering of concrete arch bridges and similar structures, highly adaptable where it is not economical to use ordinary centering. Can be knocked down and saved for further use after they have served their purpose as centering



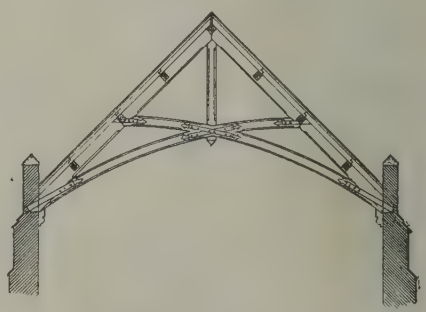
Hammer Beam Trusses with Gothic Arch

This type of truss is used extensively in churches. Can be furnished plain or paneled to suit



Grandstand Trusses

Have a cantilever portion which is the part of the truss projecting over the supporting columns, offering additional protection for the grandstand seats proper and covering the front row boxes. Especially attractive in appearance



Scissors Trusses

With straight or curved braces makes a simple, economical and attractive roof truss for churches, clubs, and residences

SUMMERBELL TRUSS COMPANY

Wood Roof Trusses

TELEPHONE
FRANKLIN 0590

30 North La Salle Street
CHICAGO, ILL.

Products

Manufacturers and erectors of WOOD ROOF TRUSSES.

Wood Roof Trusses

Spans designed from 30 to 125 ft. in accordance with best standard engineering practice and to comply with various local ordinances.

Trusses can be erected at the building site anywhere. No delays due to inability in obtaining materials; local lumber yards carry in stock all sizes of materials used in the construction of this truss.

Information Required for Estimates

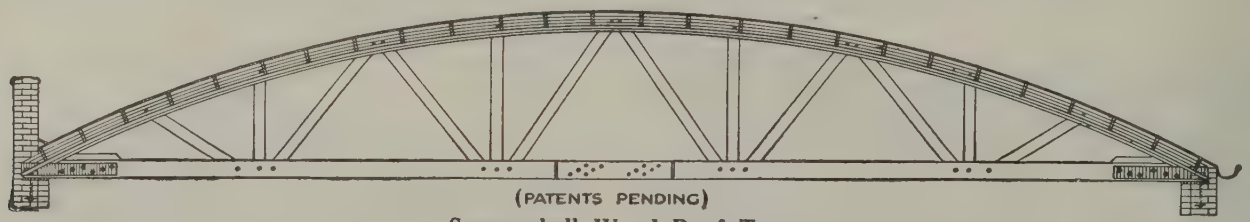
In requesting quotations the following information is necessary:

(1) Number of trusses required. (2) Span out-to-out of building walls. (3) Spacing of trusses. (4) Loads: roof, ceiling or special loadings. (5) Location of building, name of architect and owner's name.

Service

Estimates and details furnished on request.

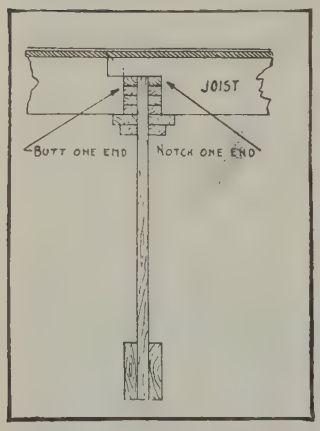
It is suggested that architects avail themselves of our engineering service in any design calling for special types of roof trusses.



(PATENTS PENDING)

Summerbell Wood Roof Truss

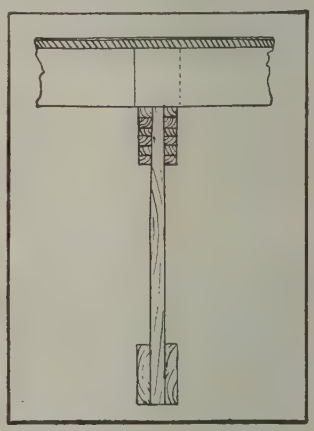
Large solid section web members spaced far apart assure maximum light distribution. Heavy laminated top chord and bottom chord of two large solid sections reduce fire hazard. Note that the arch of the top chord is uniform from end to end and that there are no sharp breaks which cause rain to carry gravel to the gutters, or allow tar melted by the sun to run down



Section Standard Summerbell "Rigid-roof" Construction

Summerbell trusses save several courses of brick wall on all sides of the building in addition to making a rigid roof

80-ft. Span Trusses at Chicago Airport



Section of Ordinary Construction

Roof joists set on top of top chord.

Trusses of this type can be furnished, if desired

100-ft. Span Trusses Carrying Shafting Load in Factory Building

BATES EXPANDED STEEL TRUSS CO.

Bates-Truss Joists

EAST CHICAGO, IND.

Product

BATES-TRUSS EXPANDED STEEL JOISTS.

Description

The Bates-Truss Joist is an expanded one-piece steel truss. In the expansion process, no material is cut from the web of the original section; the web is simply slitted and expanded. The expansion process transforms the web of the I-beam section into an open lattice truss web. The act of expanding increases the depth of the beam and materially increases its strength.

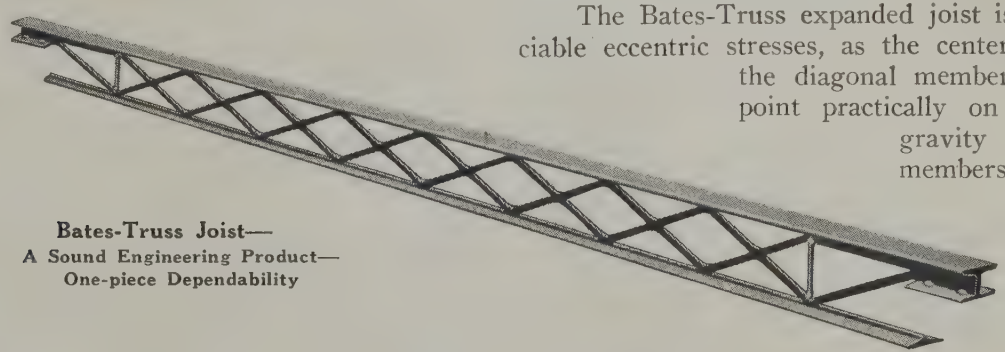
The Bates-Truss Joist functions as a steel truss. Its properties are readily calculable by standard formulae. Its strength is uniform. The process of manufacture automatically tests every joist for any possible defect in either material or workmanship. The human equation is eliminated.

Advantages

The Bates-Truss Joist lends itself readily to all types of joist floor construction. The open web of the expanded truss is an obvious advantage over a solid web, because it permits piping to be run easily through the joists.

The Bates-Truss expanded joist is a one-piece steel truss—neither rivets nor welds are relied upon in stress of shear or tension.

The Bates-Truss expanded joist is without appreciable eccentric stresses, as the centers of gravity of the diagonal members intersect at a point practically on the centers of gravity of the chord members.



Bates-Truss Joist—
A Sound Engineering Product—
One-piece Dependability

Specifications

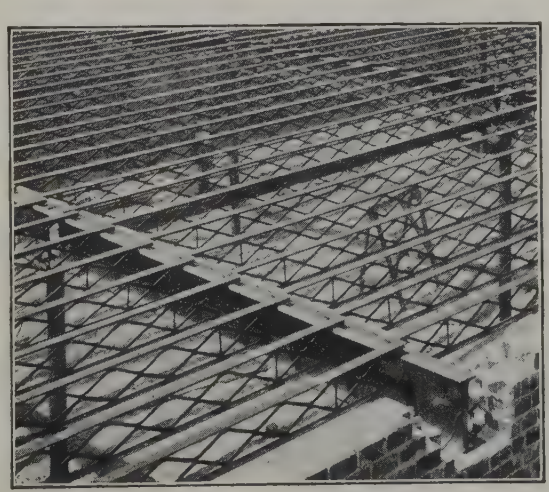
General Description—The system of floor construction will use Bates-Truss Joists of the sizes detailed. The joists shall be placed parallel to each other on spacings as detailed, and shall be supported at their ends on either structural beams or on masonry. Concrete shall be poured over the joists to form a slab .... inches thick, supported by .... *(either mesh lath or forms)* .... Diamond mesh lath is to be attached to the ceiling side of the joists, and .... inches of ceiling plaster applied.

Bates-Truss Joists—The joists shall conform to the standards established by the BATES EXPANDED STEEL TRUSS CO. and shall be made from structural grade steel expanded. All joists are to be of sizes specified on the plans. Where the sizes of the joists are not indicated, they shall be in accordance with the manufacturer's tables of safe loads.

Bearings—At least 4 inches of bearing shall be provided where the joists rest on masonry, and at least 3 inches of bearing shall be provided where the joists rest on steel supports.

Bridging—Bridging wire is to be placed at suitable intervals in the length of the joists. The wire is to be secured to the flanges of the joists, connecting each joist to its adjacent joist by a system of crisscross bracing. The end joists of each panel are to be suitably side anchored to the structural steel member or masonry.

Steel Lath—The steel lath for the floor shall be ... *(plain or rib)* ... lath weighing .... pounds per square yard. The steel lath for the ceiling shall be .... *(plain or rib, depth of rib)* .... weighing .... pounds per square yard. The lath is to be securely fastened to the joists with Bates lath clips. Rib lath is to be attached with the ribs up.



Temperature Rods—Temperature rods .... inches in diameter are to be placed on .... inch centers.

Note: The use of temperature rods or mesh reinforcing is not universally specified. It is, however, a valuable insurance in certain types of floor finishes to prevent cracks due to expansion and contraction.

Nailing Strips—Where wood floors are called for over the concrete, screed or nailing strips shall be embedded in the concrete slab. The nailing strips shall be 2 in. wide by 1 in. deep (or of greater depth) and shall be held in position by screed chairs, or by other suitable means, while the concrete is being poured. Screed strips shall be run (preferably at right angles) to the joists on .... inch spacings.

Concrete—Concrete for the floor slabs shall be *(usually 1)* part cement, *(usually 2)* parts sand and *(usually 4)* parts gravel. A comparatively dry mix is recommended to minimize dripping.

Loading Tables

Complete loading tables for Bates-Truss Joists are included in the Bates-Truss Joist general catalogue. The tables are prepared in both 16,000 and 18,000-pound stress values.

CONCRETE STEEL COMPANY

Havemeyer Truss

42 Broadway, NEW YORK, N. Y.

For Sales Offices, Warehouses and Fabricating Works, see page A144
For Havemeyer Concrete Reinforcement Bars, Devices, etc., see pages A144-146

Havemeyer Truss

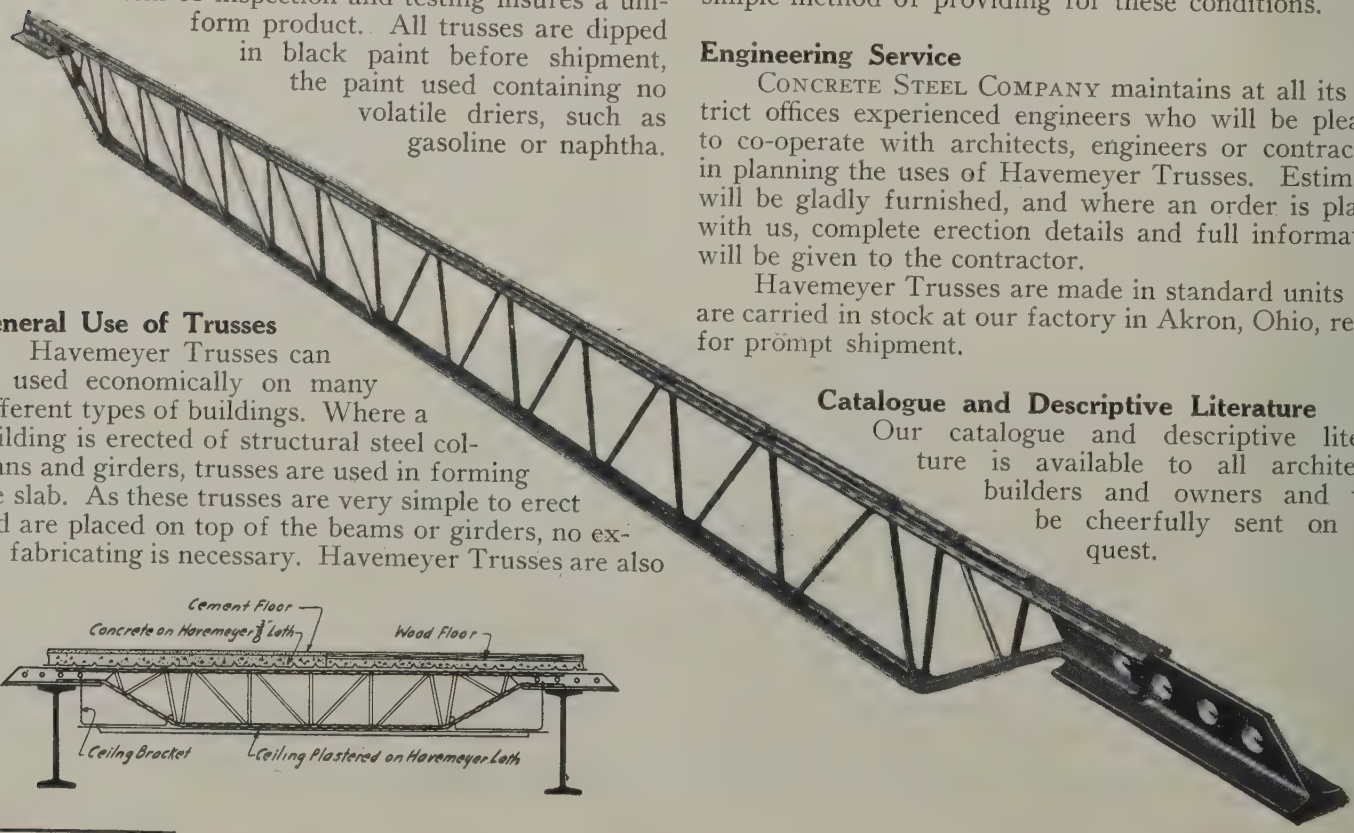
The Havemeyer Truss is a scientifically designed truss, of the Pratt type, electrically arc-welded, and when used in connection with a concrete floor slab and metal lath ceiling, makes an economical fireproof construction which can be erected quickly and requires no form work.

General Description

Havemeyer Trusses are made up of five bars, four being chord members and one being used as a web member. The upper and lower chords consist of two steel bars of structural grade joined together with struts made of similar bar stock. These five bars are formed in the shape of a Pratt truss and electrically arc-welded at all intersections. The ends of the truss are connected by welding to a tee section, which acts as a bearing plate for the truss. Actual tests made have shown that the Pratt type of truss is particularly well adapted for this construction. Special attention has been given to the design and arrangement of end web members, which are so arranged as to provide for additional stresses at that point—the result of extensive laboratory tests.

The holes in the web of the Tee at each end provide best means of anchorage when used on masonry or concrete walls.

All steel used is made from highest quality open hearth structural grade steel, with a minimum ultimate tensile strength of 55,000 lb. All welds are carefully made by experienced welders and a rigid system of inspection and testing insures a uniform product. All trusses are dipped in black paint before shipment, the paint used containing no volatile driers, such as gasoline or naphtha.



General Use of Trusses

Havemeyer Trusses can be used economically on many different types of buildings. Where a building is erected of structural steel columns and girders, trusses are used in forming the slab. As these trusses are very simple to erect and are placed on top of the beams or girders, no extra fabricating is necessary. Havemeyer Trusses are also used on structural concrete buildings for carrying the floor slabs, the columns and girders being reinforced concrete. They are used on residence work and are particularly recommended for the first floor even if the house is to be built of frame, and when properly put in place in connection with concrete slabs, they form an effective fire-stop for fires originating in the basement or cellar. The trusses are particularly suited for use in such buildings as hospitals, schools, apartment houses, hotels, institutions, garages, etc., built for light loads.

Havemeyer Trusses, with open webs, allow space for running pipes, electrical conduits, etc. This has been found of great advantage in most types of buildings.

These trusses are made to fit all spans from 4 to 31 ft.

Where a truss is laid on steel beams or girders, a clip is driven over the end of the truss and the upper flange of the structural support to hold the truss firmly in place.

A metal lath ceiling can be readily attached to the underside of the truss.

Metal Lath and Specialties

In making bids, our estimate includes furnishing of trusses, rib lath for floor slabs, ceiling brackets, anchors, clips for fastening trusses to girders in the case of steel buildings, sleeper clips, lath wedges, and annealed wire for bridging, also metal lath for ceilings when it is required.

Where small openings are required in the floor, we furnish headers which are easily attached and form a simple method of providing for these conditions.

Engineering Service

Concrete Steel Company maintains at all its district offices experienced engineers who will be pleased to co-operate with architects, engineers or contractors in planning the uses of Havemeyer Trusses. Estimates will be gladly furnished, and where an order is placed with us, complete erection details and full information will be given to the contractor.

Havemeyer Trusses are made in standard units and are carried in stock at our factory in Akron, Ohio, ready for prompt shipment.

Catalogue and Descriptive Literature

Our catalogue and descriptive literature is available to all architects, builders and owners and will be cheerfully sent on request.

GABRIEL STEEL COMPANY

Manufacturers of Steel Joists

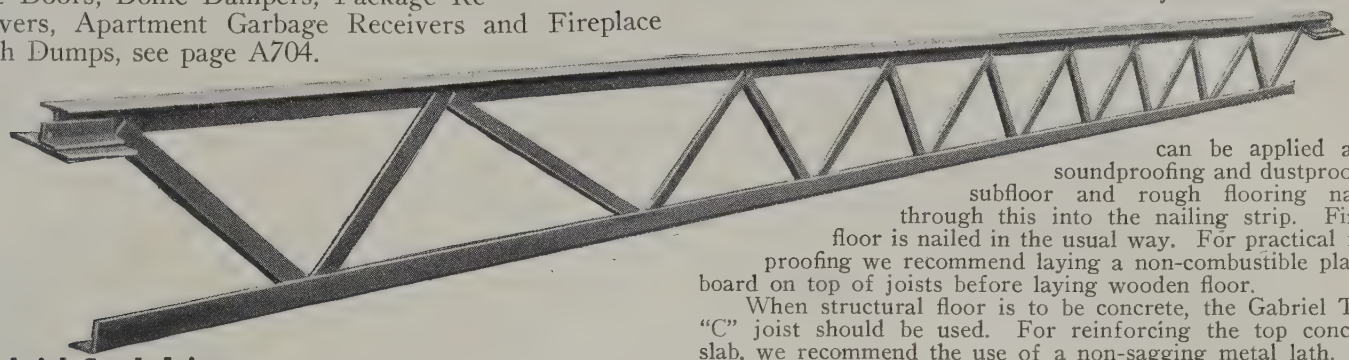
2441 Bellevue Avenue, DETROIT, MICH.

Products

GABRIEL STEEL TRUSS JOISTS.

Also Scaffold Brackets, Horse Legs, Reinforcing Bars and Chairs.

For Rolled Steel Coal Chutes, Ash Pit Doors, Dome Dampers, Package Receivers, Apartment Garbage Receivers and Fireplace Ash Dumps, see page A704.



Gabriel Steel Joists

Gabriel steel joists are designed especially for floor construction in all types of light occupancy buildings. They are adaptable to either wood or concrete flooring and insure practical fireproof construction without the delays coincident with reinforced concrete construction. Fabricated from rolled steel sections, they are really steel trusses in miniature. They weigh approximately only half as much per foot as wooden joists of equal strength. Top chord of specially designed section affords maximum rigidity both vertically and horizontally.

Advantages of Use

Their advantages of usage, aside from their natural reduction of fire hazard, lie in their strength and the ease, speed and economy with which they can be installed. Framing of openings is properly taken care of. Individual joist capacity warrants a comparatively wide spacing which gives economy in installation of plumbing, heating and electrical work. No cutting is necessary. Plaster cracks due to wood joist shrinkage are entirely eliminated.

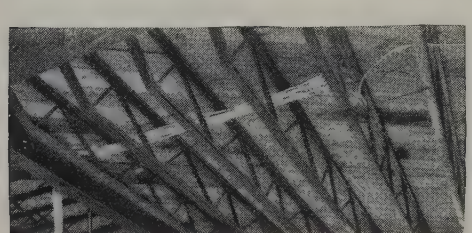
Sizes and Capacities

Gabriel steel truss joists are furnished in two types: Type "W" joist for use with wood floors, Type "C" joist for use with concrete floors. Gabriel Type "W" joists have a capacity of from 100 to 130 lb. per ft. of joist. Gabriel Type "C" joists, 170 to 200 lb. per ft. of joist. Variations in length of both "W" and "C" type joists are closely graded. A bearing plate is attached to all joists.

In design a complete analysis of all main and secondary stresses has been made. In the case of each joist, all stresses in every joist member have been carefully computed by analytical methods, and checked by graphical solution. We will gladly send loading tables upon request.

Joist Installation

Gabriel steel truss joists are adequately supported on wide plates rigidly attached and of sufficient length to assure safe bearing conditions. Since the joists are built to fit the span for which they are used, the truss is carried—full length—to the bearings, thus insuring maximum rigidity. The center of gravity of the joist is below the bearing plate. This greatly simplifies the work of erection, since it is merely necessary to place the joist in position, and it will automatically remain in a vertical position. This low center of gravity, together with the wide bearing plates used, makes the joist very stable during the erection operation, eliminating any danger of joist rotation.



Lateral bracing of the top chord and diagonal bridging are of great importance. Special fittings are furnished for these two purposes.

Floor Construction

Gabriel Type "W" joists are designed to replace wood joists where a wood floor is desired. A wood nailing strip, rigidly attached to the side of the top chord, permits nailing the rough subfloor directly to the joist in the same manner as to a wooden joist. Plaster board can be applied as a soundproofing and dustproofing subfloor and rough flooring nailed through this into the nailing strip. Finish floor is nailed in the usual way. For practical fireproofing we recommend laying a non-combustible plaster board on top of joists before laying wooden floor.

When structural floor is to be concrete, the Gabriel Type "C" joist should be used. For reinforcing the top concrete slab, we recommend the use of a non-sagging metal lath. An important Gabriel feature is the ease and economy of attaching top lath rigidly to steel joist. Note from the illustration above that no separate furring channel is required at the end of the joist for the support of ceiling lath.

Metal Lath Quickly Attached

Metal top lath is easily and quickly attached by wire clips, which are furnished with each shipment of joists. Illustration shows how lath is securely held in position. Short pieces of standard pipe are furnished as a tool for attaching lath clips.

Pipe and Conduit Installations

Because of the design of the top chord member, it has been possible to provide a relatively wide spacing of panel points and give ample space for the installation of pipes, conduit, etc., concealed between the floor and the ceiling. The illustrations below show this factor clearly.

Erection Drawings

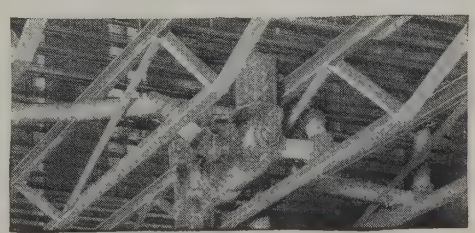
A steel joist layout showing location and mark of all joists is made by our engineering department. In preparing architectural or structural drawings, it is only necessary to specify the type of Gabriel joist required and the center to center spacing. The Gabriel nomenclature gives the depth of the joist, the type of joist and the over-all length. Mark numbers simplify the spotting and placing of joists on the job. Indestructible metal tags upon which the mark is clearly stamped are attached to every joist.

Shipping

Gabriel joists are always carefully loaded and securely braced against movement in transit. The number of joists, joist mark and over-all length are carefully checked. Every care is taken to insure joists being delivered to the building site in perfect condition.

Send for Catalogue

Complete catalogue containing typical details, properties and calculations; safe load tables for both Types "W" and "C" joists; and other information will be sent upon request.



Illustrations Show How Easily Conduit and Pipes Can Be Installed

INGALLS STEEL PRODUCTS COMPANY

BIRMINGHAM, ALA.

SALES REPRESENTATIVES AT PRINCIPAL CENTERS

The Ingalls Electrically Welded Pratt Type Deck Truss

The Ingalls Truss is not just another steel joist or truss, but is the result of accumulated knowledge and experience with all that has gone before. The type is the conventional Pratt deck truss, designed in strict accordance with accepted standards of truss analysis. The eccentric and bending stresses at the ends are fully resisted by properly proportioned and solidly welded end panels and seats which act as a single unit at each end.

The joints are fastened by metallic arc welding process. This method of welding is recognized by authorities as the only efficient and certain means of fastening joints of this character. No tack welds or butt welds are used. The number of welds is the minimum that can be used, thus reducing the possibility of faulty joints. Each weld is formed of continuous beading of proper length and cross section to adequately resist the imposed stress. Each joint is reinforced with additional metal from the electrode and, being fully fused with the parent metal, produces a section stronger than the bars. Each weld of each truss is rigidly inspected and tested so that broken welds or joints are avoided.

The *anchorage,* an Ingalls development, insures a rigid fastening for the truss, a positive lateral support for the carrying beams, and a thorough tie for the floor system as a whole. This anchorage results in a rigid floor without spring, and by thus relieving the concrete slab of undue stress, prevents excessive cracking.

Specifications for Ingalls Trusses

Floor and Roof Construction—(1) The floor system shall consist of steel trusses or joists as hereinafter specified, over which a 2-in. concrete slab will be placed. The ceiling under these trusses or joists will be installed by others. The trusses or joists as manufactured by the INGALLS STEEL PRODUCTS COMPANY of Birmingham, Ala., have been taken as the standard and are approved for this work.

Materials—(2) All steel shall conform strictly to the standard specifications of the American Society for Testing Materials, Serial Designation A-15-14 of medium grade.

Design—(3) All steel floor trusses or joists must be of conventional design and subject to a rational analysis as applied to trusses. Complete details and calculations for these members shall be submitted to the architect, and his approval obtained, before bidding on the work.

(4) The unit stresses shall not exceed those given in the specifications of the American Institute of Steel Construction adopted June 1923. The sections to resist bending at the ends shall be taken as the areas of the top and bottom chords and the gusset plate, where bending exists due to multiple points of support. The areas of the bearing plate shall be neglected.

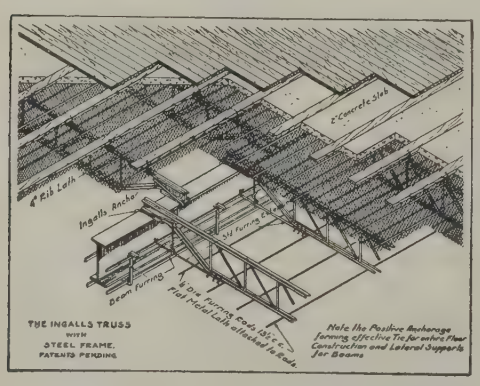
Calculations of stress submitted shall show the resistance to bending for each inch of length of the end seat and the resistance of the chord members to eccentricity due to the heel joint.

Welding—(5) Only metallic arc welding shall be used in the fastening of the joints of this truss. This welding shall be in the form of continuous beads of sufficient length and cross section to develop the strength of the joint or section. The end seat section shall be welded with beads of sufficient length and cross section to develop the full strength of the section and to insure that it will act as a unit. All welding shall be such that proper penetration is secured without burning, the parent and the deposited metal shall be fully fused. All welded joints shall be free from indents and cut-outs caused by the arc and the full section of the parent metal maintained.

Details—(6) The spacing and depth of these trusses or joists as shown on the drawings are the maximum allowable for this work. Bearing on masonry walls shall be not less than 4 in. Bearing on steel beams or girders shall not be less than 3 in., measured parallel to the long axis of the joist. Chord members shall be of uniform cross section for entire length. Splices to increase the size or length of any member, will not be permitted. Welding web members to a single chord member producing an eccentric joint will not be permitted.

Painting—(7) Each truss shall be painted before shipment with a standard paint acceptable to the architect. This paint shall contain no volatile dryers such as naphtha or gasoline.

Testing—(8) Each joint of each truss shall be fully tested by methods as approved by the architect and a certificate of such tests furnished with each shipment. If deemed advisable, a loading test shall be made at the site of the work. This loading test shall consist of a uniform load applied to two or more of these trusses or joists, selected from those shipped to the job, and set to a span equal to that used. The load applied shall equal twice the total designed load and the trusses or joists shall have a deflection not exceeding 1/360 of the clear span.



Anchorage—(9) All trusses shall be properly anchored as outlined herein. Where these trusses are supported by masonry walls these anchors shall be placed at each end of every second truss, or not more than 4 ft. apart and shall consist of a horizontal steel rod or bar with tee end and extending at least 8 in. into the wall.

These anchors shall be firmly attached to the truss by means of a proper hook or bolted thereto.

(10) With concrete tee beams, having an effective depth from the top of the slab, these trusses or joists shall have anchorage formed by the extension of the section into the concrete. The end of the chord section shall project a distance of not less than 3 in. inside of the vertical face of the stem of the beam. The ends of this extension shall be joined by welding an anchor as shown or approved to form the anchorage for the truss. The gusset or bearing plate shall project not more than 3 in. into the concrete. This anchorage shall be such that it will not separate the concrete mass composing the beam and must provide positive and combined action of the beam and the truss.

(11) Where these trusses bear on steel beams or girders, they shall be effectively fastened to the beams as shown or approved. The anchors provided must be fastened to the trusses and the beams in a manner that will anchor the truss end, provide lateral support for the beams and tie the floor system through as a whole. The use of friction or spring clips or loose anchors as anchorage will not be permitted.

Lateral Bracing—(12) The lateral bracing for these trusses shall consist of a crossed bracing or bridging consisting of not less than 14 gauge galvanized wire firmly attached to the top and bottom chord members, crossed and twisted tight at the center point between the trusses. This bridging must be tight and hold the trusses in a truly vertical plane. This bridging shall extend the full length of the panel. The trusses at the ends of the panels must be laterally braced or tied to the wall or beams by means of a continuation of the wire bridging, or a special rod or bar anchor fastened to both the top and bottom chords. This bridging shall be spaced not less than 4 ft. apart.

Erection—(13) The trusses are to be set on the supports and spaced in accordance with the setting plans. Immediately after setting in place, the bridging and anchors are to be installed. The reinforcing for the floor should not be placed until ready for concrete. Lath placed on the top of the trusses shall have the ribs up and securely fastened to the trusses at sufficient intervals to prevent undue sag.

Spacing of Trusses—(14) No truss or joint shall be spaced a distance exceeding 24 in. center to center for any floor panel, and not exceeding 30 in. center to center for any roof panel.

Note: The following should be specified under concrete work:

Floor and Roof Construction—(15) The floor (and roof) construction will consist of steel trusses or joists, over which this contractor shall pour a 2-in. concrete slab reinforced with.....

Note: Either a metal lath or a combined steel fabric reinforcement and form should be specified. If metal lath is specified it should be as follows:

(a) For a truss spacing not exceeding 18¾ in. use metal lath having not less than ⅜-in. ribs and weighing not less than 3.4 lb. per sq. yd. For a truss spacing of 19 to 24 in. use a metal lath having not less than ⅜-in. ribs and weighing not less than 4.0 lb. per sq. yd. For a truss spacing exceeding 24 in. use a metal lath having not less than ¾-in. ribs weighing not less than 5.4 lb. per sq. yd.

(b) In lieu of metal lath as reinforcing for this slab, a combined form and reinforcing, consisting of wire mesh having a paper backing as a form, of not less than 12 gauge wires, spaced not exceeding 3 in. center to center at right angles to the trusses and 4 in. center to center parallel thereto and electrically welded at their intersections. The area of this reinforcement shall not be less than .034 sq. in. per ft. width of span.

(c) The metal lath or fabric reinforcement should be stretched tight over the top of the trusses and fastened securely in an approved manner to the top chord member of the truss.

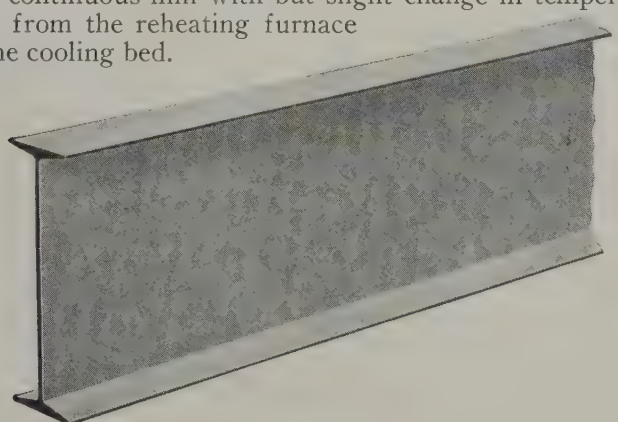
J&L JUNIOR BEAMS

Junior Beams—Description

The J & L Junior Beam is a structural steel section made from structural grade basic open hearth, copper-bearing steel, rolled from the billet to the full I-section, in a continuous mill with but slight change in temperature from the reheating furnace to the cooling bed.



The process by which it is possible to obtain a section having the dimensions of the J & L Junior Beam, combined with its very light weight, is of recent development—the result of advanced engineering and mill practice. After leaving the finishing rolls no straightening is required. There is no warping during cooling and tests show that the internal structure of the Junior Beam is free from stresses.

The function of the J & L Junior Beam as a floor beam is to carry the live and dead floor loads and transfer them to the heavier main carrying members of the framework or to the supporting walls. The success of the Junior Beam is based upon its simplicity of design and ease of installation; its adaptability, durability, light weight, rapidity of erection, and economy.

Rust Resistance

All J & L Junior Beams are rolled of copper-bearing steel, a positive defense against atmospheric corrosion.

Weathering tests made through many years by American Society for Testing Materials have proved the surprising resistance of copper-bearing steel to the inroads of corrosion. The results have indicated that the addition of copper even in small proportions will more than double the useful life of a roofing sheet. Experiments with structural shapes in which the content conforms to standard mill practice for copper-bearing steel have fully confirmed this conclusion.

Corrosion is arrested, and if the surface is painted the paint sticks and does not flake off.

Originators of Junior Beams have been forward looking in supplying the need for light structural shapes. They have also taken care to make them out of the most durable metal, by adding copper content to the steel in the proportions called for by the American Society of Testing Materials.

J & L Service

Jones & Laughlin District Sales Offices are located in all important centers. J & L Engineers familiar with J & L Junior Beams and their uses are available in these offices for advice and assistance.

When you desire to have detailed information in connection with the design of J & L Junior Beams, please ask the nearest office for Bulletin which contains all such data. (See addresses and telephone numbers above.)

The Jones & Laughlin Steel Corporation offers also, the aid of skilled field engineers to service any particular building operation in which Junior Beams are used.

Official Classification of Junior Beams

Junior Beams are extensively used throughout the United States and Canada in floor systems, the carrying capacity of the Junior Beams being based on the same fiber stress as that of standard weight structural steel sections. They have been thoroughly tested for the building commissioners of the larger cities of the country by eminent engineering authorities. As a result of rigid tests conducted by Prof. W. J. Krefeld in the Columbia University Testing Laboratories, Junior Beams were granted structural steel rating in the five boroughs composing New York City. A similar rating was accorded the Junior Beam in Boston in consequence of tests conducted by Prof. H. W. Hayward of the Massachusetts Institute of Technology.

These, together with other tests, have served to confirm and substantiate the conclusion reached by Prof. Milo S. Ketchum after his tests at the University of Illinois that Junior Beams should be classed as structural steel and they are so classified throughout the United States and Canada.

J & L Junior Beams are rated as structural steel by the American Institute of Steel Construction and their properties and dimensions are included in the handbook of information published by the Institute, pages 298-299.

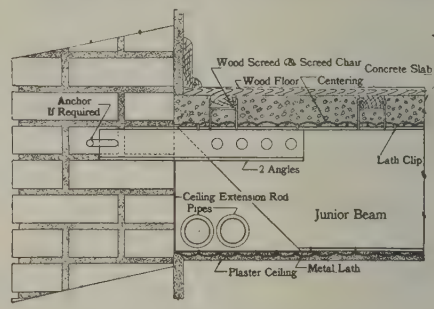
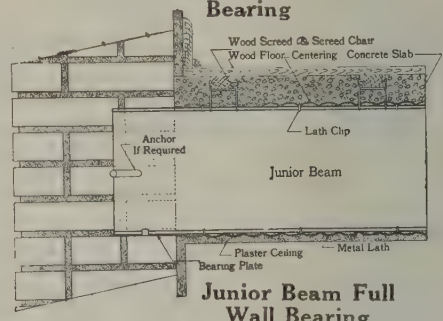
Standard End Connection on Steel



Standard End Connection Wall Bearing



Junior Beam Full Wall Bearing

Uses for Junior Beams

Since Junior Beams are essentially hot rolled structural shapes, they afford the building public additional sections for various uses.

Their chief use is as secondary members in floor and roof panels in all classes of buildings. They are being adapted in constantly increasing quantities as purlins and girts for mill buildings, hangars for airplanes and dirigibles, in protection sheds over side walks used during building construction, as monorails, supports for mechanical and conveying equipment.

Junior Beams should not be confused with the various types and designs of steel joists which are now on the market. Occasionally Junior Beams are specified by architects with steel joist alternates and vice versa. This practice is not recommended due to the inherent dissimilarity of the products.

Junior Beams are homogeneous steel I-beams in their original symmetrical form as rolled, and as such can be used in structural design up to their full value, by employing the simplest of engineering formulae and without empirical assumptions.

The adaptability of Junior Beams in floors materially increases the economy of the many systems now used, chiefly due to their simplicity of fabrication, lightness and ease in erection, efficiency and dependability.

Floor and roof systems in which the carrying members consist of rolled steel intermediate beams, or secondary members, are limited in their use only by the character and disposition of the fireproofing.

Due to the fact that building codes vary in their fireproofing requirements, the relative arrangement of steel and fireproofing materials must of necessity vary in different parts of the country.

On the following page will be found certain suggested floor designs which will meet any building code fireproofing requirements.

Erecting J & L Junior Beams with Standard End Connections

Specifications

Architects and engineers should include Junior Beams in the structural steel section of specifications, as they are an integral part of the structural framework of the building, to be supplied by the structural steel contractor. This procedure insures proper co-ordination of design and detail under one engineering control, and also proper timing of arrival of all structural material to the site and erection by the same erector.

The following specifications have been developed with the idea that they will aid designers in properly specifying J & L Junior Beams. Specifications may be used either in whole or in part with absolute confidence; they represent the best thought and standard practice at the present time.

Description—The floor system shall consist of Jones & Laughlin Junior Beams, serving as secondary floor beams, of the sizes and at the spacings shown on drawings. The J & L Junior Beams shall be supported (by standard end connections), (by hangers), (by shelf angles), (on top of structural beams), (on bearing walls). Before shipment all J & L Junior Beams shall be given a coat of oxide paint. Paint with a coal tar base shall not be permitted. If a second coat of paint is to be applied by the erector in the field, mention of it should be made here. Paint that will flow at high temperatures should be barred.

LIVE LOADS

	Corridors	Rooms	Loads
First floor			
Second floor			
Intermediate floors			
Roof			

Additional Pieces—An additional J & L Junior Beam shall be used under each partition running parallel with the Junior Beams. For cross partitions, where necessary, due allowance should be made in figuring dead loads.

Bridging—The J & L Junior Beams shall be bridged where lateral support is not otherwise provided continuously at distances not to exceed 6 ft. with No. 12½ galvanized wire. The end Junior Beam in each panel shall be fastened to bridging anchors set in outside wall, or to parallel structural steel and bridging twisted taut. Tie rods or other types of bridging may be substituted for continuous wire bridging if required to meet special conditions.

Continued on next page

Coping—Where tops of Junior Beams are to be level with tops of supporting structural steel, and supported on shelf angles, the tops of Junior Beams shall be coped to allow full bearing on shelf angle.

Clamps—Clamp shall be used to fasten bottoms of Junior Beams to top of structural steel when the Junior Beams bear on top of flange of the main carrying members. When tops of Junior Beams are coped, a special clamp shall be used to attach Junior Beams to top flange of main beam.

Wall Plates—Plates shall be used under the ends of Junior Beams resting on bearing walls.

Hangers—Where it is desired to support the Junior Beams by hangers, these hangers shall provide a bearing for the Junior Beams not less than 3 in. and be supported over top flange of main beam by at least 1½x1½x$\frac{3}{16}$-in. angles.

Anchors—Where Junior Beams rest on masonry walls, a ½x8 in. round anchor shall be used in (such Junior Beams as the local building code requires) or wall ties ¾x12 in. corrugated and galvanized, laid on lath before concreting and anchored in wall.

Screeds—Where wood floors on top of concrete slabs are specified, they shall be nailed to screed or nailing strips, preferably of hardwood, imbedded in the slab. Screed strips shall be 2 in. wide by 1½ in. deep (or greater depth) nominal dimensions, and shall be attached to the top of Junior Beams by means of proper chairs. Screed strips shall run (at right angles to the Junior Beams and be spaced .... in. apart) (parallel and on same centers with the Junior Beams), (diagonally to the Junior Beams). Substitution may be made for the following dependent upon the type of floor system under consideration.

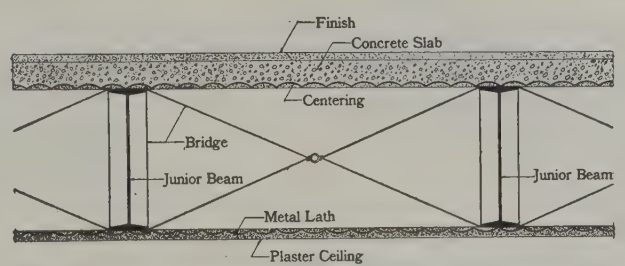
Centering—For specifications for centering on top of the J & L Junior Beams, the designer should refer to details covering same as found in the Junior Beam Bulletin obtainable on request. Lath shall be applied with sheets running at right angles to the Junior Beams. Metal lath shall be securely fastened to the tops of the Junior Beams with lath clips at 12-in. centers, except at ends of sheets where lath clips shall be at 6-in. centers, and applied with a special tool furnished by the manufacturers of the J & L Junior Beams. Lath sheets shall be securely wired together along the side laps midway between Junior Beams. Any approved form of metal lath or backed floor fabric may be used. Any and all clips, ties, or other accessories necessary for the proper application of each particular type of centering shall be used in accordance with these specifications or the specifications of the manufacturer of the respective centering materials. *The writer of the specifications shall define the type and quality of the centering to meet the particular requirements.*

Floor Slabs—Concrete for floor slabs shall be composed of one part cement and a graded mixture consisting of not more than seven parts of fine and coarse aggregate, mixed sufficiently dry to prevent dripping through the metal lath or wire mesh. Where the spacing of Junior Beams is greater than 30 in. a proper reinforcing shall be provided to conform to local building code requirements.

Temperature Rods—When finished floors are made of composition, terrazzo or materials other than wood, temperature rods shall be used, spaced not over 18 in. apart.

Ceiling Lath—Ceiling lath (covered elsewhere under the plastering specifications) shall be firmly wired to pencil rods, which shall be, in turn, securely fastened by means of approved clips, to the lower flanges of the Junior Beams. Where the spacings of the Junior Beams are narrow, flat or ribbed lath may be fastened directly, by means of an approved clip, to the lower flanges of the Junior Beams. Ribbed lath shall be applied so that the ribs are at right angles to the direction of the pencil rods, or, when pencil rods are omitted, to the Junior Beams.

The J & L Lath Clips and Lath Clip Tool can be obtained directly from the manufacturers, fabricators and hardware dealers.

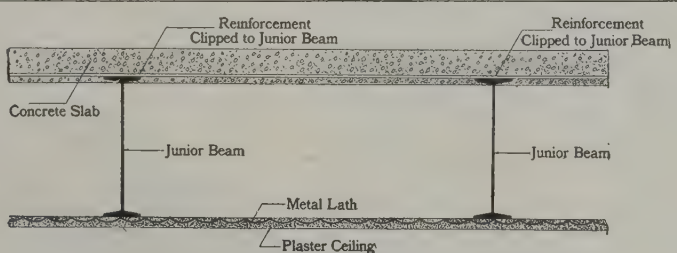


Concrete Slab on Permanent Centering

This is the most common and cheapest arrangement of Junior Beams and companion materials. The top slab consists of concrete poured in place on permanent centering.

The ceiling consists of gypsum or Portland cement plaster on metal lath.

In order to insure ease in application, pencil rods and flat ceiling lath are recommended.

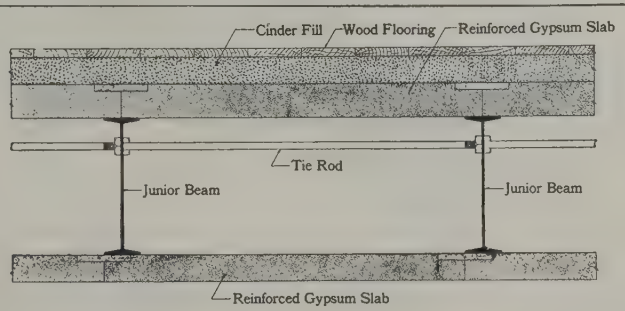


Concrete Slab on Removable Forms

Additional stiffness is obtainable by this method which is adaptable to tall slender buildings. The top slab is poured in place on wood or metal forms.

The ceiling consists of gypsum or Portland cement plaster on metal lath.

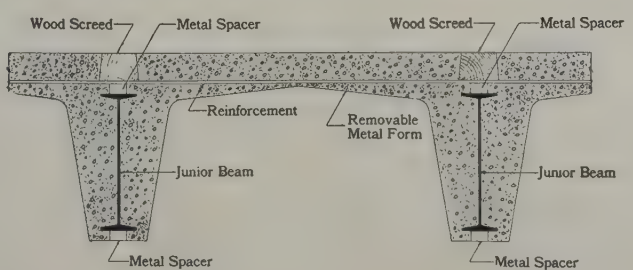
In order to insure ease in application, pencil rods and flat ceiling lath are recommended.



Gypsum Slabs

The lightest common type of floor providing four hour fire protection to the room above, or below, is obtained by means of precast reinforced gypsum floor and ceiling slabs securely fastened, by various types of clips or hangers, to the Junior Beams.

An alternative method to the above is the pouring in place of similar slabs, on removable or permanent centering.



Junior Beams Totally Incased

By the use of removable "tin pans" and various types of clips and hangers, four hour fire protection is secured and is permissible under the strictest building codes.

KALMAN STEEL COMPANY

Manufacturers of Kalmantruss Joists

CHICAGO, ILL.

For Offices, see page B1698

Products

KALMANTRUSS JOISTS.

Also Wall Anchors, Beam Anchors, Masonry Bearing Plates, Bridging Anchors, Sleeper Anchors, Furring Extension Rods, Adjustable Floor Lath Clips, Header Angles.

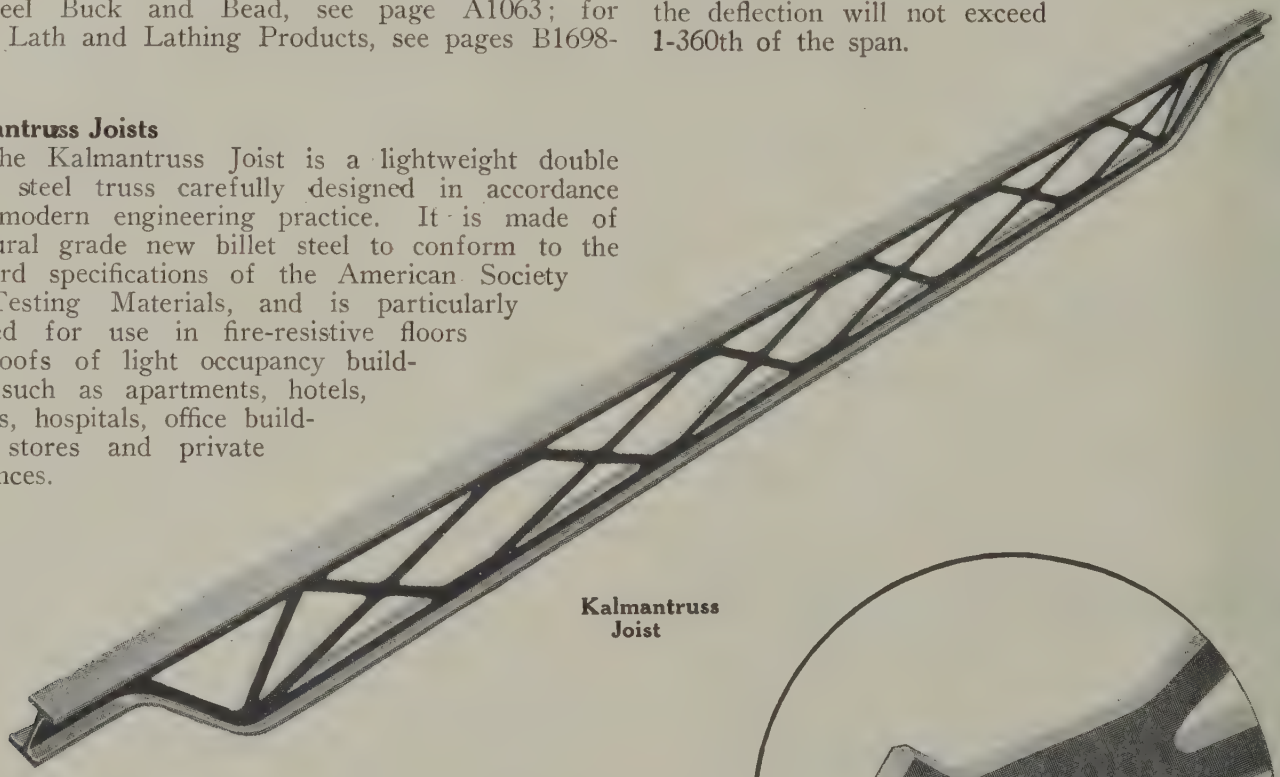
For Concrete Reinforcement, see page A149; for Steel Buck and Bead, see page A1063; for Metal Lath and Lathing Products, see pages B1698-1699.

Kalmantruss Joists

The Kalmantruss Joist is a lightweight double lattice steel truss carefully designed in accordance with modern engineering practice. It is made of structural grade new billet steel to conform to the standard specifications of the American Society for Testing Materials, and is particularly adapted for use in fire-resistive floors and roofs of light occupancy buildings, such as apartments, hotels, schools, hospitals, office buildings, stores and private residences.

Safety Insured

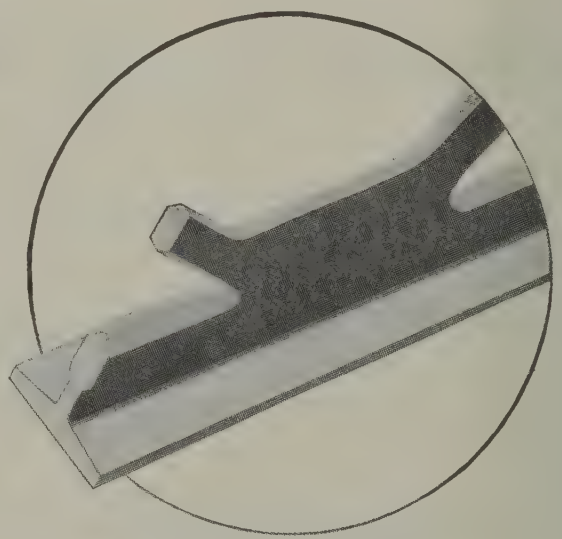
When the Kalmantruss Joist is properly installed and braced as in standard floor construction, it will in all cases carry a uniformly distributed live load greater than twice its rated live load capacity. And when subjected to a load equal to its rated capacity, the deflection will not exceed 1-360th of the span.



Kalmantruss Joist

One-piece Joints

The Kalmantruss Joist is not an assembly of individual parts. It does not depend upon welds, rivets or bolts to hold it together. The chords and inclined web members are formed from the same piece of steel. These members are so designed that their center of gravity lines meet at a point, thereby eliminating eccentricity at the joints. The joints are in all cases capable of developing the ultimate strength of the web members.



Kalmantruss Joist Formation

Uniform Strength Throughout

The chords and web members are continuous and are of constant cross-section throughout the length of the joist. Because the members do not change in size, the joist is equally strong at every point. This feature enables Kalmantruss Joists to carry safely partition or other concentrated loads that may occur at any point in the span. The ends of the truss are additionally strengthened by means of vertical compression members electrically arc welded in place.

Catalogue

Complete catalogue and descriptive literature is available, showing details of joist construction, specifications, and safe loading tables. With the Kalmantruss Joist, Kalman offers a newly-designed, and most efficient line of anchors and accessories. Kalman also offers a specially designed metal lath for floors and ceilings in joist construction. Write for catalogues to cover these products.

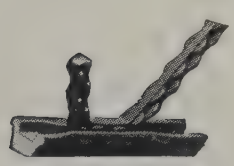
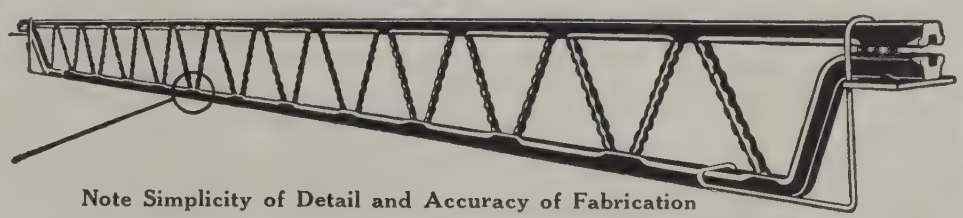
Uses

Rivet-Grip Steel Joists are used for fire-safe floor and roof construction, or wherever a rigid, permanent, fire resisting and economical type of construction is desired in light occupancy buildings.

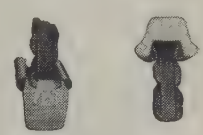
Rivet-Grip Steel Joists have been in the market for five years and have been used in several hundred buildings, which include apartment houses, banks, office buildings, schools, churches, libraries, theaters, hotels, garages, stores and residences.



Patent No. 1013608
Other patents pending



Note Simplicity of Detail and Accuracy of Fabrication



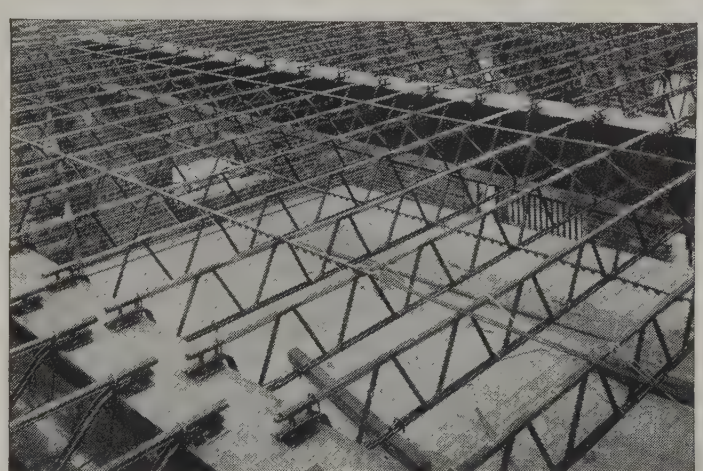
Section through the Rivet-Grip

Design

Rivet-Grip Steel Joists are fabricated from specially rolled, heavy steel sections. The truss construction gives light weight with the greatest possible carrying strength. The top and bottom chords consist of heavy rolled flange sections and the lightest web members are ⅜ in. thick. The web members are joined to the chord members by the Rivet-Grip process, which produces a uniform and positive mechanical connection and develops the full strength of component members of the truss.

These joints are so rugged and completely encased by the chord sections, that they are positively protected from damage in shipment or rough handling in the field. There are no welded connections except on bearing plates and no thin metal members subject to corrosion. All joists are painted with rustproof paint before shipment.

Our special continuous notched angle and double diagonal galvanized wire bridging is always furnished with our Rivet-Grip Steel Joists. This bridging not only serves to hold the joists in place before concreting, but also acts as a series of transverse trusses for distributing concentrated loads, which come on the completed floor.



Rivet-Grip Steel Joists in Place Ready for Top Lath

Note that joists are simply dropped into position with ends resting on top of beams or walls. Also note the two rows of notched angle and double diagonal bridging at the third points of the joists

Advantages

Rivet-Grip Steel Joists are lighter, unit for unit, than ordinary structural members of equal strength. They are easily handled by workmen, as individual units or in bundles by cranes, as they allow chains or ropes to be inserted through the open webs, eliminating all danger of individual joists slipping out.

The open webs of the joists allow ample space for the running of pipes and conduits, and eliminate cutting and boring of webs and the expense of excessive fills, raised floors or special furred ceilings to conceal pipes.

Less concrete or plaster is required with Rivet-Grip Joists because the lath is held so rigidly, when attached by wiring, that it will not deflect excessively when concrete is poured on top or plaster is applied from below.

Rivet-Grip Steel Joists are fabricated for each individual job, insuring joists with adequate end bearing and enabling the designer to select uniform depth of joists for varying spans, thus eliminating furring in order to obtain uniform ceiling heights. They are delivered complete with erection marks on metal tags fastened to each joist.

Designing and Estimating Service

The Rivet-Grip Steel Co. or nearest representative will gladly submit estimates upon request. The following items can be included in the estimate: Rib lath for floor slabs, temperature steel, furring rods, beam clips for fastening joists to steel beams and screed or sleeper clips and metal lath for ceilings, in addition to our standard notched angles and galvanized wire bridging.

Assistance in preparing the most efficient and economical layout for any building will be given without incurring any obligation.

THE MACOMBER STEEL COMPANY

Massillon Bar Joists and Massillon Nailer Joists

901 Belden Avenue, CANTON, OHIO

For Massillon Steel Building Products, see pages A658-659; for Massillon Vault Reinforcing, see pages A1342

Steel Joist Products

Two distinct types of steel joists (U. S. Patents No. 1651032, No. 1614248, No. 1614247, No. 1614249) are manufactured. The Massillon Bar Joist is built up from steel bars and steel plates. It is designed to carry concrete floor decking, and concrete or steel roof decking. The Massillon Nailer Joist is built up from steel bars and steel plates, with a steel angle and wood strip forming the top member of the joist. It is designed for nailing wood flooring and wood roof decking directly to this top member.

Characteristics of Massillon Joists

Both joists are manufactured in a series of standard stock sizes for all spans met with in building construction. Accessories for all framing conditions are handled in the same manner. Prompt shipment is made on all orders. Each joist is fabricated with structural arc welding into a solid structural unit that will withstand the abuse of rough handling. Detailed dimensions of all joists are printed in A. I. A. Catalogs.

The illustrations below show typical details of both joists. Those on the opposite page illustrate construction details and joist accessories. The A. I. A. Catalogs contain safe loading tables, complete specifications and designing data. The loading tables show total safe loads in pounds per square foot for various center to center spacings of joists.

Bar Joist Floor and Roof Construction

Concrete Decking—Two to three inches of concrete is poured on ribbed metal lath secured to the top bars of the joists. Any type of finish flooring or roofing is laid on top of this slab.

Steel Roof Decking—Corrugated sheets or manufactured steel decking may be used in place of the concrete slab for roof construction. This is secured to the top bars with straps riveted to the sheets or with clips furnished by the decking manufacturer.

Ceiling Construction—A cement or hard finish plaster on metal lath ceiling completes the construction. A ⅜-in. rib lath is usually used with the ribs turned up to act as furring. A metal lath suspended ceiling is used below joists in panels pitched for roof slope or where shallower joists are used for short spans in irregular panels.

Massillon Bar Joists provide a decidedly economical, fireproof floor and roof construction.

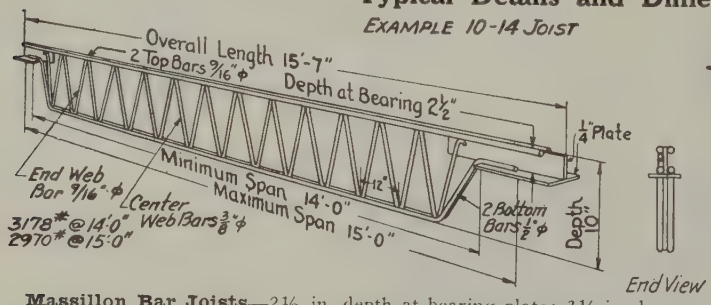
Evidence of the quality of the construction may be found in thousands of fine buildings in all parts of the United States and Canada.

Massillon Nailer Joist Construction

Nailer Joists eliminate the concrete slab that is a component part of bar joist construction. Wood flooring or roof decking is nailed directly to the top member of the joists. In other respects the construction is identical with bar joist construction.

Nailer Joists provide a floor or roof with a high degree of fire resistance when built with metal lath and plaster ceiling. This results in a construction that is firesafe for many conditions at a cost that closely approaches that of ordinary construction. Nailer Joists are frequently used for roofs of otherwise strictly fireproof buildings.

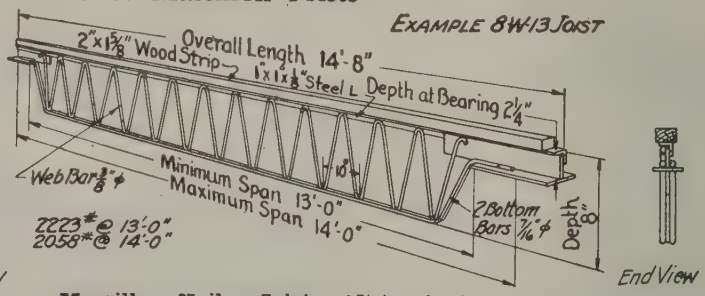
Typical Details and Dimensions of Massillon Joists



Massillon Bar Joists—2½ in. depth at bearing plate; 3½-in. bearing along joist at maximum span; maximum span one foot more than minimum span; standard joists available in following depths:

8-in. depth for spans of	4 to 16 ft.
10-in. depth for spans of	14 to 20 ft.
12-in. depth for spans of	18 to 24 ft.
14-in. depth for spans of	21 to 27 ft.
16-in. depth for spans of	25 to 31 ft.

Note: The deeper joist is more efficient for any given span.



Massillon Nailer Joists—3⅞-in. depth (including 1⅝-in. wood strip) at bearing plate; 4-in. bearing along joist at maximum span; maximum span one foot more than minimum span; standard joists available in following depths:

8-in. depth for spans of	4 to 18 ft.
10-in. depth for spans of	15 to 22 ft.
12-in. depth for spans of	18 to 26 ft.

Note: Nailer type roof purlin sections are provided in 12, 14 and 16-in. depths for spans up to 26 ft. for wide spacings of purlins with 2-in. wood decking.

Joist Specifications for Floors and Roofs

Note: The following specifications will fully protect the client's interests and insure good construction. The responsibility for preparing detailed erection plans is properly placed on the manufacturer.

Where indicated in the drawings the floors (and roof) shall be constructed with Massillon Bar Joists (Massillon Nailer Joists) as manufactured by the MACOMBER STEEL COMPANY, Canton, Ohio. Joists shall be provided of the proper size and spacing to carry the specified floor (and roof) loads. The depth of joists shall not exceed the depths indicated for the various floor (or roof) panels. In no case shall joists be spaced over ..... inches c-c in the floor construction (or over ..... inches c-c in the roof construction). Joists shall be provided alongside and parallel to the end walls in the floor (and roof) panels. Extra joists shall be provided as specified under partitions running parallel to and over the joists. Detailed erection plans shall be furnished by the manufacturer showing the location and placing of joists. The American Institute of Steel Construction Specifications shall govern.

The joists shall be placed on the supporting walls and beams in accordance with the erection plans. At least 3½ in. of bearing measured along the length of the joists shall be provided on masonry walls and every third joist end anchored to the wall with Massillon End Anchors. At least 2 in. of bearing shall be provided on steel framing and the joist ends clipped to the framing with Massillon Beam Clips.

The end joists in each panel shall be anchored to the parallel wall or beam and all joists braced laterally as indicated in the plans. The anchors and bridging shall be placed at the center, third or quarter points to provide lines of bridging approximately 6 ft. on centers.

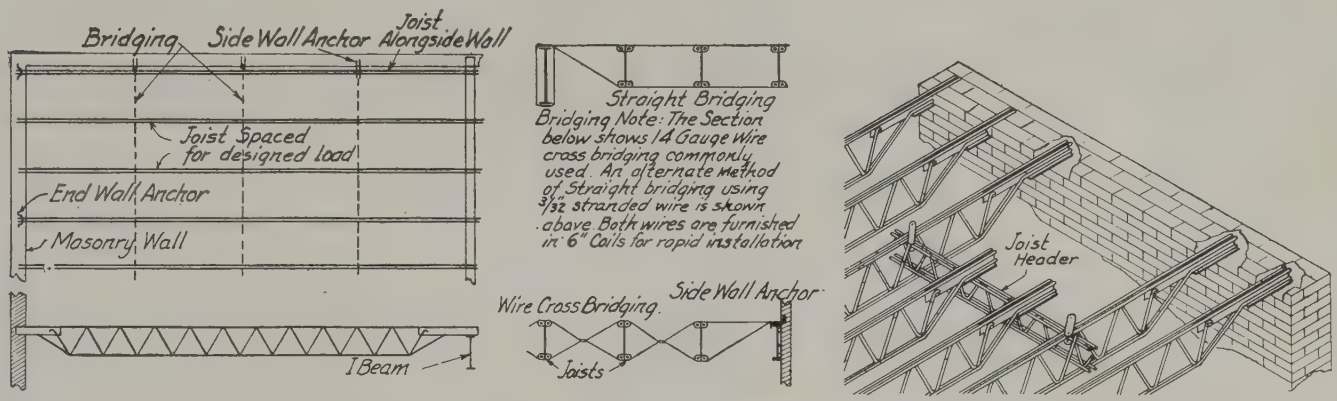
Where concrete slabs are specified the slab shall be poured on rib lath secured to the top bars of the joists with Massillon Lath Wedges. A ⅜-in rib lath weighing not less than 4 lb. per sq. yd. shall be used for all floor slabs. (A ¾-in. rib lath weighing not less than 4.5 lb. per sq. yd. shall be used for roof slabs with joists spacing over 25 in.)

Where plastered ceilings are specified a three coat ¾-in. cement or gypsum (hard wall) plaster shall be applied on ⅜-in. rib lath. The lath shall be wired to the bottom bars of the joists with the ribs turned up to act as furring. The lath shall be suspended on furring channels to provide a level ceiling where different depth joists are used in irregular panels and under pitched roof panels.

Note: Where bar joists are to carry a concrete slab, the spacing of joists should not exceed 19 in. for garage floors, 25 in. for office, hotel and residential floors or 32 in. for roofs. The spacing of bar joists for steel roof decking depends on the strength of the decking and should not exceed 5 ft. Nailer joist spacings should not exceed 18 in. in floors or 32 in. in roofs.

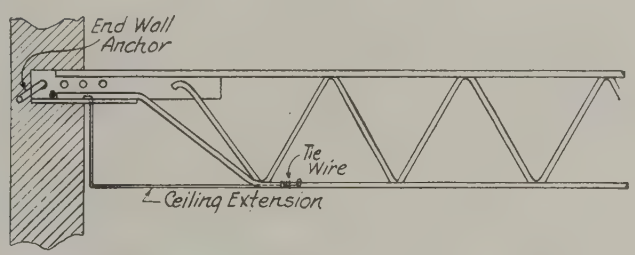
Continued on next page

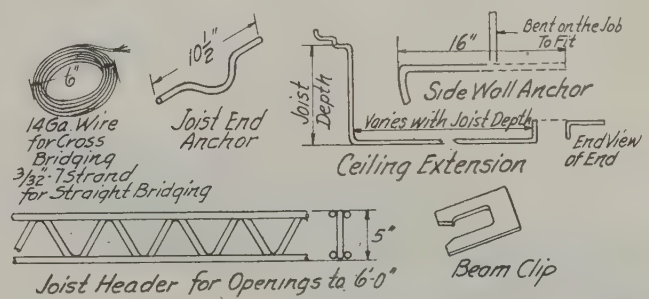
Floor & Roof Construction Details



Framing Massillon Bar Joists—Massillon Nailer Joists

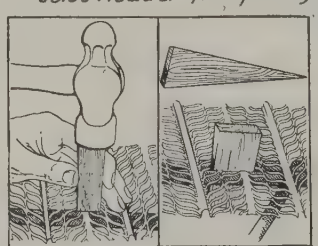
The joists are placed on supporting beams or walls in accordance with erection drawings. These drawings show the joist symbol numbers and exact spacing of joists to carry the designed floor load. Simple beam clips hold the joists in position on steel beams. An end wall anchor is inserted through every third joist end to serve as a tie where the joists bear on masonry. The joists are bridged with one or more lines of bridging. Where the end joist in a panel is alongside a masonry wall, this joist is anchored at the points of bridging with side wall anchors. Where the end joist is parallel to a beam the bridging wire is wrapped around the beam. Either straight or cross bridging may be used as illustrated above. Rough 2-in. planks can then be laid on the joists to carry construction loads equal to the designed floor loads. Smaller openings are framed with joist headers as illustrated. Larger openings such as stair wells are usually framed with structural steel.



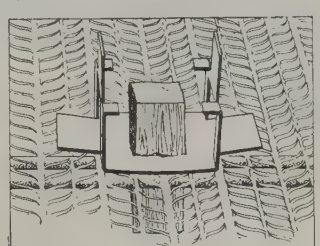


Massillon Joist Accessories

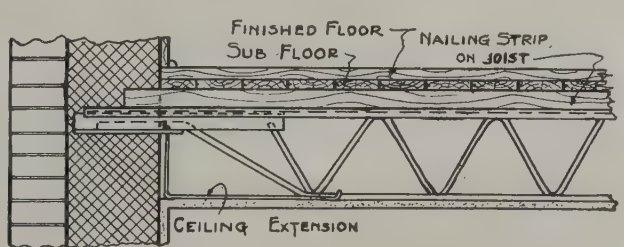
Every detail in the accessories for Massillon Joists has been proven through years of experience. The Massillon Lath Wedge and Screed Clip illustrated at the right are used only with a concrete slab on bar joists. The lath wedge is the most rapid positive and economical method of securing floor lath to the top members of the joists. The screed clip is a positive method of lining up and holding wood nailing strips above the joists. It provides for one inch of concrete fireproofing below the strip.



Massillon Lath Wedge



Massillon Screed Clip



Typical Floor Sections

A typical section of a Nailer Joist Floor is shown above. A typical section of a Bar Joist Floor taken through the joists is shown to the right. A cement floor finish such as is used in garage or porch floor is shown on top of the bar joist at the left. A wood floor finish nailed to a wood strip embedded in the slab is shown on top of the bar joists at the right. A plaster or metal lath ceiling is shown in both sections.

TRADE-MARK

Truscon Service

Truscon's organization of Sales Offices completely covers the country. Through any of these offices you can obtain the services of a competent engineering force thoroughly acquainted with the most economical practice in the application of Truscon Steel Joists.

Truscon P-G (Plate Girder) Type Steel Joists

The Truscon P-G (Plate Girder) Joist is made of structural shapes, combining utmost efficiency of design with economy of material. This joist is a combination of the most perfect grade of structural steel angles welded by the high pressure electric welding method to a rolled strip, the whole forming a plate girder of great strength. Being made in depths from 6 to 14 in., inclusive, they give the engineer considerable leeway in arriving at the most efficient design.

*Maximum stresses used 16,000 lb. per sq. in.

Truscon O-T (Open Truss) Type Steel Joists

The Truscon O-T (Open Truss) Steel Joist is a Warren truss in which the top and bottom chords are specially rolled "tee-shaped" members providing the greatest resistance to buckling strains.

The web member is continuous from end to end to positively transmit the stresses, and is carefully welded to the top and bottom chords.

The entire design is efficient and exceptionally economical of materials.

These joists can be furnished in depths varying from 8 to 16 in., inclusive.

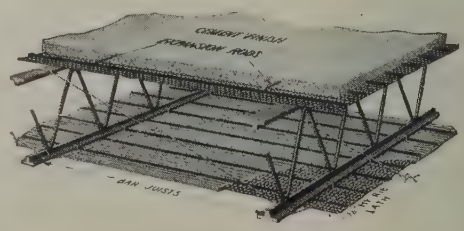
Wood Finish

Floor Finishes

Truscon Steel Joist Construction adapts itself readily to any type of floor finish. Wood nailing screeds, embedded in the concrete fill, simplify the laying of wood floors; while a cement topping over the concrete fill makes an ideal base for linoleum, carpets, or composition floors.



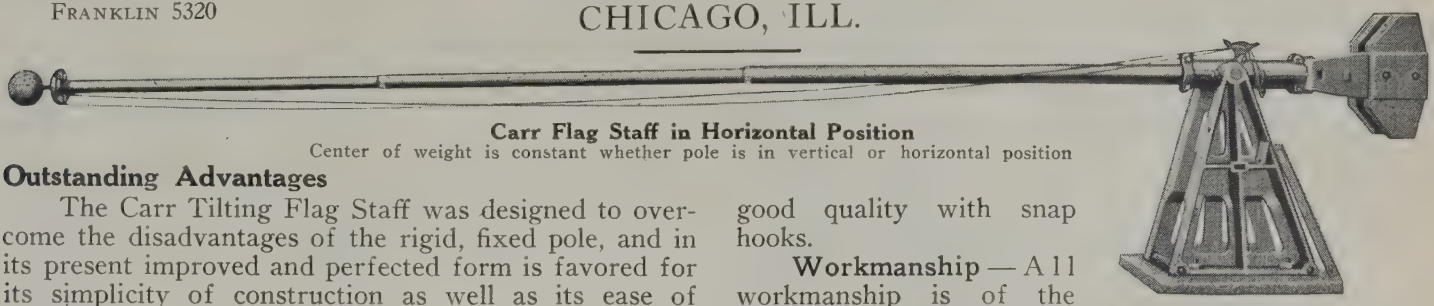
Cement Finish

ELMER E. CARR

Manufacturer of the Carr Tilting Flag Staff

TELEPHONE
FRANKLIN 5320

228 North La Salle Street
CHICAGO, ILL.



Carr Flag Staff in Horizontal Position
Center of weight is constant whether pole is in vertical or horizontal position

Outstanding Advantages

The Carr Tilting Flag Staff was designed to overcome the disadvantages of the rigid, fixed pole, and in its present improved and perfected form is favored for its simplicity of construction as well as its ease of operation and maintenance.

Counterbalanced—Each unit is provided with adequate counterweight to balance the pole proper, which is secured in a substantial socket provided with steel trunnions to engage in the standard or supporting brackets, the brackets being permanently attached to the roof or foundation. When the pole is lowered or raised the roof load is unchanged.

Repainting, inserting new halyards, etc., are accomplished with the utmost ease and economy. There are no mechanical parts, no gearing or levers to fail. One man can lower the pole by removing the key and locking bar, exerting slight pressure against the counterweight, and bringing the pole (always under control) with little effort to the horizontal. It is returned to the vertical with equal facility.

Simple Pole Support Construction—Due to the low point of gravity, only an ordinary foundation to receive the anchor bolts is necessary and a roof construction adequate to carry the weight of the unit. The supporting castings provide a rigid and sturdy anchorage without the usual "pull and tug" effect of an ordinary pole attached to the roof with structural shapes.

Economy of Erection—Erection is simply and inexpensively accomplished. After the supporting castings are set on the foundation bolts and the pole socket castings in place and shored in a horizontal position, the pole is inserted and bolted in the socket, the counterweights are then bolted in position and the trimmings attached to the top of the pole; the shoring is then removed and the counterweighted pole is easily raised to a vertical position and the locking bar inserted and keyed in place.

The parts are raised to the roof with the usual facilities provided for construction work. Once on the roof, the unit, according to size, can be erected complete by two or three men in one and one-half to three hours.

Construction

Base—The supporting structure is of cast iron, which is recognized as better able to withstand the elements than structural shapes.

Socket—The pole socket is of cast iron, with steel trunnions cast in position, and the counterweights also are of cast iron.

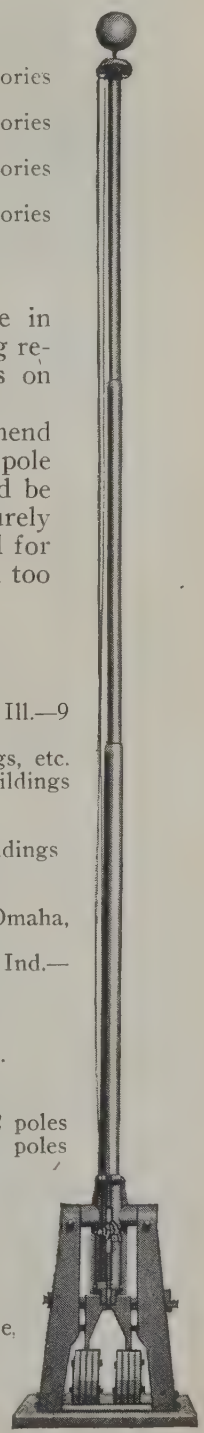
Locking Bar—The locking bar and key are of heavy steel.

Pole—The pole is made up of suitable lengths of steel tubing with lap joints welded.

Pole Trimmings—The pole trimmings consist of a seamless copper ball covered with gold leaf; a truck with two bronze pulleys; a brass nipple for connecting ball to truck; a cleat; and a halyard of good quality with snap hooks.

Workmanship — All workmanship is of the highest character. The castings are clean and free of defects.

Painting—All steel and cast iron are given one shop coat of paint.



Sizes

No. 0—20 ft.—for buildings 1 to 3 stories high.

No. 1—25 ft.—for buildings up to 10 stories high.

No. 2—32½ ft.—for buildings up to 16 stories high.

No. 3—40 ft.—for buildings up to 24 stories and higher.

Service

The manufacturer will co-operate in planning settings to suit various building requirements and will furnish drawings on request.

The manufacturer does not recommend extending roof pole over the street. A pole to extend over the thoroughfare should be attached to the face of the wall, securely anchored. A pole on the roof, designed for the height of the building, is considered too long for such a purpose.

ESTABLISHED 1909

BABCOCK-DAVIS CORPORATION

Manufacturers of Steel Flagpoles

474 Dorchester Avenue, BOSTON, MASS.

Product

B-D Easy Access Pole, Tubular Steel or Wood as preferred (patented).

For Precast Concrete Stairs, see page A728.

Design

Can be used for either flag or antenna pole.

Eliminates the expense and difficulty of repairing and replacing fouled or broken halyards. The B-D pole has many advantages. It is easy to erect, paint and inspect at all times. One man can raise or lower the pole in a few minutes. Every pole should be thoroughly inspected at least once a year. No steeplejack is required to do this with B-D Easy Access pole.

A notable feature is that the base and braces are integral. The base is drilled to be bolted to roof beams and is galvanized so that the roofer can easily solder his flashing to it. This will, in all cases, give an absolutely *tight roof* and does away with all slip-shod bracing ordinarily used, and leaky roofs. All poles can be equipped so that the flag can be flown over the parapet at any angle desired at a slight increase in cost. This advantage is appreciated on high buildings on narrow streets.

Construction

Poles are constructed of steel tubing, in graduating sizes shrunk and welded to make *watertight joints.*

Stock Lengths

Stock lengths of poles are 20, 25, 30, 35, 40 and 50 ft. Other lengths are made to order.

Erection on Building

Erection is very simple, pole is hoisted in place by building derrick, base bolted and pole raised.

Grade Installation

Base is bolted to concrete foundation furnished by others.

Economy

The saving in erection and one yearly inspection or painting will offset the additional cost of the B-D pole over the plainest type of pole that can be purchased.

Specification Form

Furnish and erect B-D Easy Access Vertical [canted .... degrees] Steel Flagpole .... high, equipped with 6-in. or 8-in. Gold Leaf Copper Ball and Ball Bearing Swivel Top, Halyards, Cleat and Hoisting Wrench, manufactured by Babcock-Davis Corporation, 474 Dorchester Avenue, Boston, Mass.

CONTINUOUS TAPERED FLAGPOLES FOR GROUND SETTING OR ROOF SETTING

Several prominent architects in preparing plans for memorials, monuments, plazas and buildings of exceptional architectural value have given thought to a flagpole installation which would properly harmonize with the architectural design of the project and have considered our continuous tapered poles which meet these requirements. Continuous tapered flagpoles are of an entirely different construction from the swaged sectional poles and are more costly. These poles are produced in either steel or bronze and may be tapered conically or with entasis. They have a smooth uninterrupted exterior surface throughout without visible joints or offsets and resemble in contour the obsolete wood flagpoles.

Continuous tapered flagpoles are not carried in stock and are made to order only. They are, however, now standardized in accordance with the accompanying table of dimensions but may also be proportioned to the architect's individual conception. The lower one-third of the visible height of these poles is cylindrical, the diameter of which corresponds to a standard pipe size and the tapered section is confined to the remaining visible height.

When continuous tapered poles are used as flagpole monuments or memorials, the architect generally designs a special bronze base and special stonework. We gladly offer our services to architects by assisting them in properly designing the necessary foundation, so that no damage may result from vibration, water or by the water freezing.

Continuous tapered flagpoles, regardless of length, are usually shipped in one piece each, without field joints, but where handling and shipping will not permit, the poles are shipped in two sections each and assembled at the erection site by means of a special field joint. This assembling, however, cannot be accomplished by inexperienced men and we will not ship continuous tapered poles in sections unless the assembling in the field is accomplished by our own men. This tends to enhance the cost slightly but insures the purchaser a first class installation which might be marred through the neglect and inexperience of others doing this work.

We respectfully request architects to consult us before specifying continuous tapered flagpoles for any of their major projects.

SMALL CONTINUOUS TAPERED OUTRIGGER FLAGPOLES

Metal flagpoles of the continuous tapered construction are being used as outrigger or window poles in place of the frequently unsafe wood poles. Continuous tapered outrigger poles are made in either steel or *bronze* and are suitable for banks, office buildings, etc., where it is desirable to fly a flag at lower levels than a flagpole located on the roof. These poles are extended out from the face of the building at an angle of 45 degrees above the horizontal plane and vary in length from 16 to 30 ft. The minimum top diameter is 1½ in. with a wall thickness of approximately $\frac{8}{16}$ in. increasing downward to the butt. They can be tapered conically or with entasis as selected by the architect. For details of these poles see drawing B-12 above.

Continuous tapered outrigger flagpoles are also constructed with *hinged* arrangement, as shown on drawing B-14 below, which permits righting the poles for repainting or repairs at a minimum cost. The *hinged* arrangement eliminates the risky and expensive operation with a boatswain's chair from the roof and saves the expense of scaffolding or dismantling.

However, poles with the *hinged* arrangement do not have the dignified appearance of the fixed outrigger poles shown on drawing B-12 above, but for economical maintenance and easy accessibility, we recommend the outrigger poles with the *hinged* arrangement shown on drawing B-14 below.

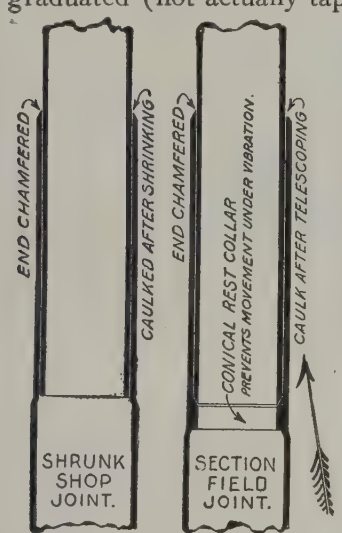
Two Types of Poles

Two distinct types of poles, dissimilar in construction and greatly varying in cost, are available. To avoid confusion and unfair bidding they should be distinctly specified as either Steel Tubular Poles or as Taper Welded Poles as may be the case. Terms such as Taper Poles with Welded Joints or Taper Welded Steel are ambiguous.

(Taper Welded Poles are described under separate heading further on).

Steel Tubular Poles

The usual, commercial Steel Tubular Poles are graduated (not actually tapered) by joining consecutive, diminishing diameters of standard steel pipe; the joints being either *shop* type, swaged, telescoped and shrunk, or of the *field* type, similarly swaged; to be telescoped in the field. Field joints are inevitable for transportation of poles in excess of railroad car lengths and for economical trucking. The field joints are self-aligning (conical rest collar), without pins, bolts, lead, cements and calked steel to steel with only a hand hammer and a common plumber's calking tool.



In all our steel tubular poles the following *outside diameters* of pipe in consecutive rotation (without skipping any one size) are employed as follows:

TABLE "A." OUTSIDE DIAMETERS OF PIPE

16, 15, 14, 12¾, 11¾, 10¾, 9⅝, 8⅝, 7⅝, 6⅝, 5⅛, 5, 4½, 4, 3½, 2⅞, 2⅜, and 1⅞ in.

Standard Poles—For ground or roof setting.

The bending resistance at the uppermost support (brace collar or roof tube or ground line) is calculated to a formula accepted in conservative engineering and all building departments.

The following table gives the safe diameter (bend-resistance) for standard tubular poles at their *uppermost* support:

TABLE "B." SIZES OF STANDARD POLES

Exposed or unsupported height of pole—ft.	15	20	25	30	40	50	60	70	75	80	90	100	125
Standard diameter at uppermost support—in.	3½	4	4½	5	5⅝	6⅝	7⅝	8⅝	9⅝	10¾	11¾	12¾	14
Tip diameter—in.	2⅜	2⅜	2⅜	2⅞	2⅞	2⅞	2⅞	2⅞	2⅞	2⅞	2⅞	2⅞	2⅞

Light Pattern Poles—Lighter than Standard and designed for ground setting *only,* therefore subject to lesser stresses of handling.

TABLE "C." LIGHT PATTERN POLES

*Height above ground—ft.	17	25	33	41	49½	57½	65½	73	80	90	100
Light Pattern diameter at ground—in.	3½	4	4½	5	5⅝	6⅝	7⅝	7⅝	8⅝	9⅝	10¾
Diameter at tip—in.	2⅜	2⅜	2⅜	2⅜	2⅜	2⅜	2⅜	2⅜	2⅜	2⅜	2⅜

*Not alterable in this type.

For full specification of light pattern and standard poles fully trimmed for ground setting see catalogue page two in A.I.A.14F folder in your file or sent on request.

Extra Heavy Poles—Made to meet the demand for poles of larger than Standard diameter to resemble proportions of wooden poles.

TABLE "D." EXTRA HEAVY POLES

*Unsupported or exposed height—not **less** than—ft.	20	25	30	35	43	51	59	67	75
Extra Heavy pole, diameter—in.	5	5⅝	6⅝	7⅝	8⅝	9⅝	10¾	11¾	12¾
Practical tip, diameter—in.	2⅞	2⅞	3½	3½	3½	3½	3½	3½	3½

*Keep above this minimum height to avoid an unreasonable multitude of joints.

Additional Butts—All steel tubular poles are standardized on the basis of their exposed or unsupported height, to which we add necessary *additional butt* to meet requirements. Thus a pole 45 ft. above roof braced 5 ft. up should be specified as a standard steel tubular pole 40x45 ft. (5$\frac{9}{16}$-in. diameter). A pole 70 ft. above roof and set on top floor 10 ft. below roof should be specified as 70x80 ft. (8⅝-in. diameter). A call for a 30-ft. pole would result in a 5-in. diameter, but if braced above roof can be specified as 25x30 ft. (4½ in. diameter).

Taper Welded Poles

These are an artcraft product, welded up from rolled plates; are actually *tapered* either conically or with the Venetian entasis, have a perfectly smooth exterior surface unbroken by visible joints.

The tip diameter is limited to a minimum of 4¾ in. while the largest visible diameter can be chosen from any of these given for steel tubular poles (see Table "A"); but must be proportionate to the selected tip and the visible height by assuming a taper of from ⅛ to ¼ in. per foot of exposure and then compromising to the nearest Table "A" diameter.

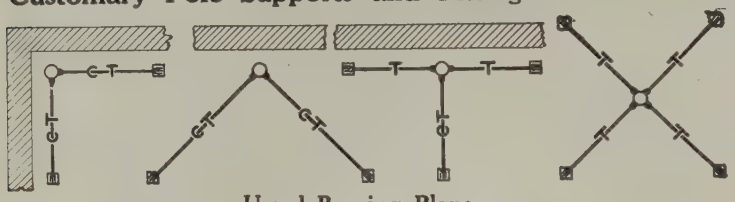
The majority of architects prefer the Venetian entasis. This curve leaves the lower one-fifth to two-fifths of the visible height almost cylindrical, therefore we employ pipe for this portion, and the more costly taper construction to the balance of the height. We suggest that architects so visualize this type of pole and preferably consult us before specifying.

Taper welded poles have been used occasionally on roofs of buildings of outstanding prominence (Morrison Hotel; Chicago Tribune Tower; A. T. & T. Building, New York; Newark Chamber of Commerce; and twenty or more others) but are more usually accepted for flag pole monuments. The taper portion of these poles in steel costs approximately $16.00 to $20.00 per running foot.

Continued on next page

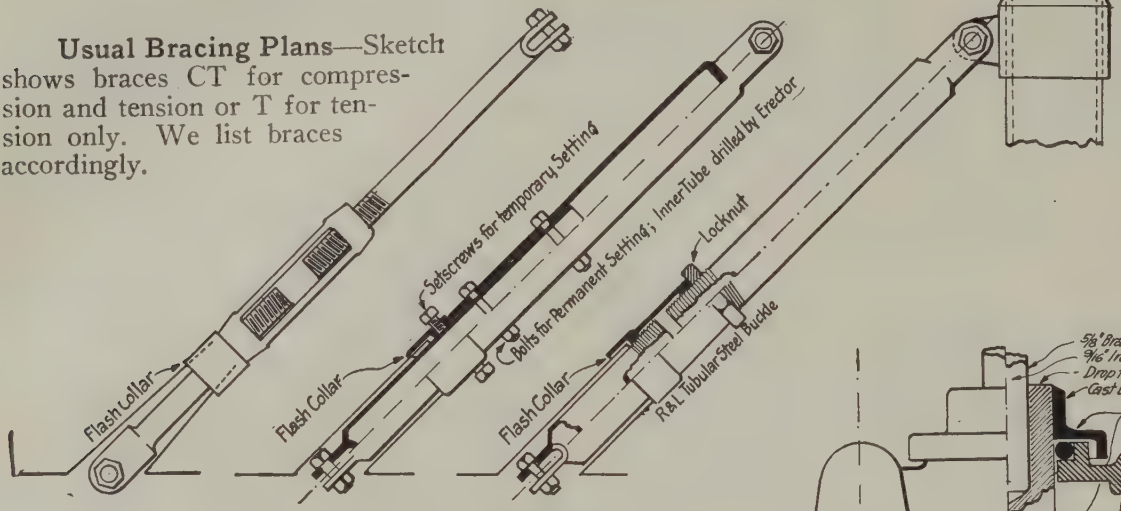
Bronze Poles—Taper welded poles are also produced by us now in *bronze* at reasonable prices, considering their evident imperishability without painting.

Customary Pole Supports and Fittings



Usual Bracing Plans

Usual Bracing Plans—Sketch shows braces CT for compression and tension or T for tension only. We list braces accordingly.



Tension Brace | Telescope Brace | Standard Brace

Braces—Three types of braces are available as illustrated.

Typical Brace Collar—Calked to pole prevents corrosion unavoidable with the old style of forged and bolted clamp bands.

Bottom Forks—Bottom forks of all braces fitted to various brace anchors, as shown in illustrations.

Suggestion—In the interest of efficiency, installation and simplicity of specification we suggest that you call upon us for proposal of "Standard Construction" which we will gladly submit *without obligation on your part.*

We will invariably suggest bracing best suited to your individual project and yet the least costly. Injudicious selection of braces frequently causes unreasonable costs without adequate superiority of installation. Ask us first—then specify, and avoid costly, sometimes irreparable errors.

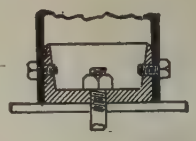
Brace Anchors

Pole Socket and Rest Plate—See Brace Anchors for various forms of securing to various types of roof structures.



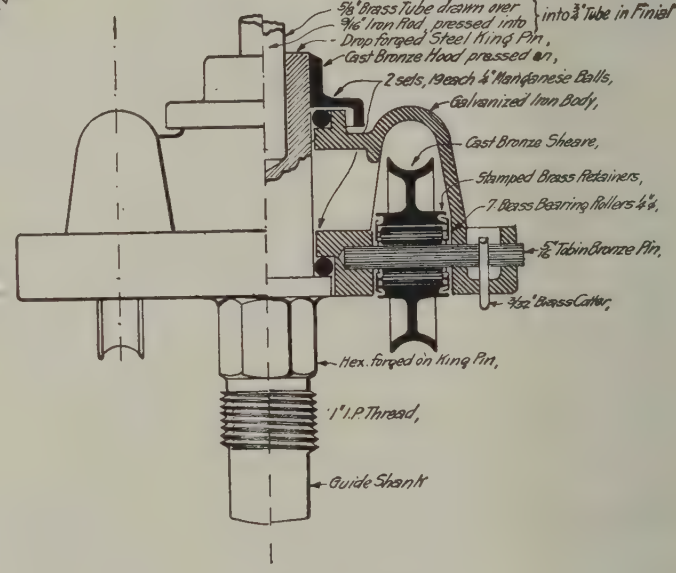
Customary Pole Trimmings

Gilt Ball Finials—20-oz. spun copper and finished in 23-kt. gold leaf over weatherproof sizing, mounted on ¾-in. brass tube. Stock sizes: 4, 5, 6, 8, 10, 12, 14, 16, 18 and 24 in.

Trucks—Poletube truck for poles up to 3½-in. tip (not applicable to taper welded poles.)

Similar Simmons truck for poles up to 5½-in. tip. Similar Giant truck for poles up to 10-in. tip.

Weathervanes—See catalogue page 5 in A.I.A.14F folder.



Poletube Truck

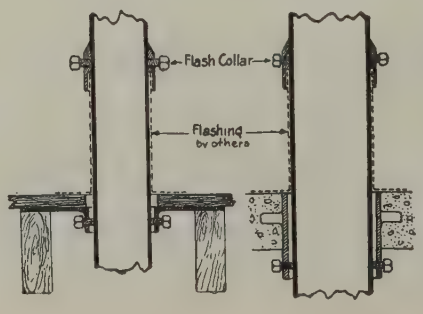
Cleats—9-in. galvanized, attached to poles with two $\frac{5}{16}$-in. cap screws.

Halyards—⅜-in. diameter bolt rope or Silver Lake No. 10. We furnish no metallic (wire rope or chain) halyards under any circumstances, because they are impractical, dangerous and injurious to the pole.

Cleat Covers, Flash Collars—See catalogue page 5 and 8, in your folder A.I.A.14F.

Guide Flange

For wood or steel roof construction. Can be screwed either to bottom or top of rafters.



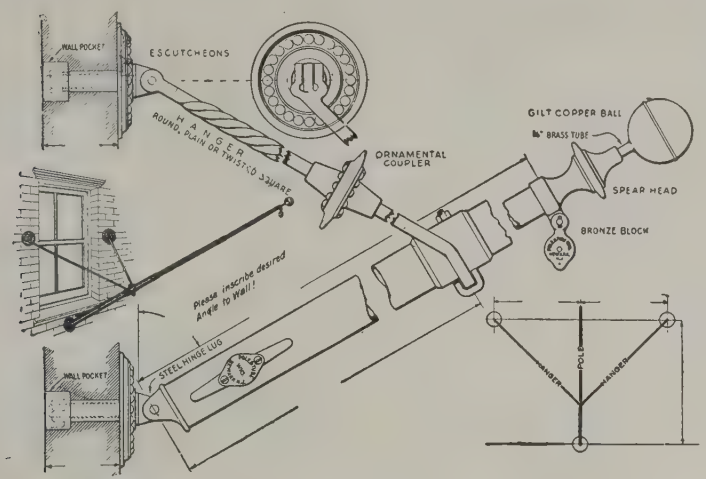
Roof Tube

For concrete roof construction. Can be moulded into new concrete roofs or grouted into existing ones. One inch larger than pole diameter.

Continued on next page

Window and Outrigger Poles

Steel poles of tubular construction, as well as Continuous Taper Welded poles, have been largely adopted as window or outrigger poles. They offer the advantages of our *hinged* construction, which permits righting the poles for repainting or repairs at a minimum cost. It avoids the risk of climbing out and saves the expense



WINDOW POLES—TUBULAR STEEL CONSTRUCTION (TELESCOPED JOINTS)

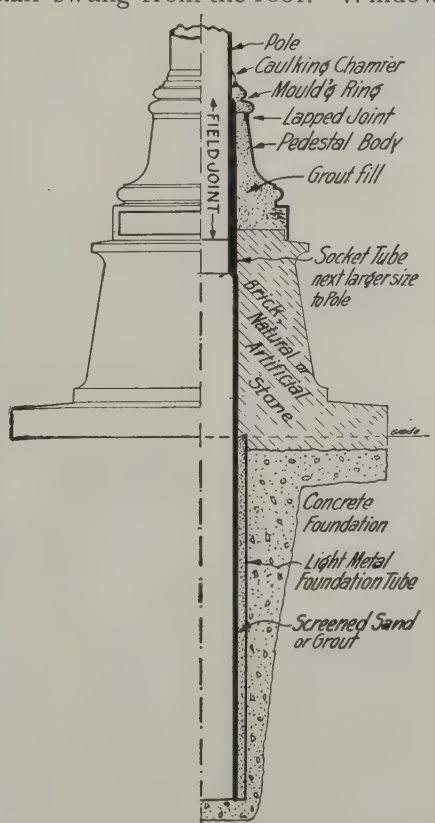
Length, ft.	Light diameters	Medium diameters, in.	Heavy diameter, in.
12	2⅜x1⅞	.....	2⅞x2⅜
14	2⅞x1⅞	.....	3½x2⅜
16	2⅞x1⅞	3½x2⅜	4 x2⅞
18	2⅞x1⅞	3½x2⅜	4 x2⅞
20	2⅞x1⅞	3½x2⅜	4 x2⅜
22	3½x2⅜	4 x2⅞	4½x2⅞
25	4½x2⅜	4½x2⅞	5 x2⅞
30	4½x2⅜	5 x2⅞	5 9/16 x2⅞

of scaffolding or dismantling, or the expensive operation with a boatswain's chair swung from the roof. Window poles are fitted with a special shackled, heavy cast bronze block (the usual truck is impracticable).

These poles are *galvanized* all over after fabrication.

Ask for plates WP-50*a* and WP-5*a*.

Monument Flag Pole Construction—Practical for flag pole monuments facilitating erection and protecting against corrosion and damage by freezing, vibration, etc.



Pole Pedestals

We have patterns for a variety of iron or bronze castings; ask for circular.

Taper Welded Steel Flag Pole—War Memorial at Plainfield, N. J.

HELMLE & CORBETT, Architects — L. L. MANNING & SON, Contractors
GAETANO CECERE, Sculptor — MOREHOUSE CO., Bronze Founders
80 ft. above grade, 16-in. butt x 5-in. tip, entasis taper

Typical Installation Plates

Consult "Typical Installation Plates" in your folder A.I.A.14F sent (or yours for the asking).

Service

If you will send us a rough sketch showing setting conditions we will gladly submit suggestions for installations, saving your time and assuring first class work and lowest consistent prices.

Product

Manufacturers of CREX PATENT COLUMNS.

Construction

Crex Patent columns consist of an outer shell of steel filled with concrete, and only the best materials are employed in their manufacture.

Especial care is taken in filling these columns so that the concrete filling shall be perfectly solid and uniform throughout, thus obtaining the full strength of a solid concrete interior.

The caps and connections are made of steel, of sufficient strength to receive the superimposed loads.

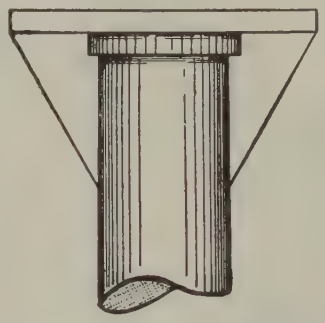
CREX PATENT COLUMN CO. holds the original patent for an all-steel cap. The cap being entirely of steel, its strength can be reliably computed.

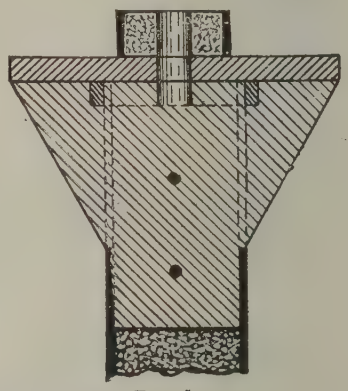
The connections are made in such a manner that only a steel plate separates the shaft of the lower column from the one above, securing the full strength of the column at the connection. Crex columns can be furnished in about one-fifth the time required for other columns.

CREX PATENT COLUMN CO. was formed for the purpose of supplying the increased demand for this class of columns with the best that can be made, both as regards strength and appearance.

Safe Loads

Tables of safe loads in thousands of pounds for Crex light weight and heavy weight Patent columns are shown below.





Crex Patent All-steel Two-way Brackets

LIGHT WEIGHT CREX COLUMNS

Outside diam. pipe, in.	Radius of gyration, in.	Thickness of steel shell, in.	Area of steel shell, sq. in.	Wgt. of steel shell, per ft., lb.	Area of concrete, sq. in.	Weight of column per ft., lb.	Safe load in thousands of pounds for unbraced length of column, ft.								Maximum length of column

12¾	3.187	.375	14.58	49.56	113.10	167.36	421.7	408.7	396.0	382.8	369.8	356.9	343.9	330.7	42′-6″

Safe loads shown above are derived from the formula:

$$\text{Safe Load} = \left(\frac{Ac}{12} + As\right)\left(19200 - 72\frac{L}{R}\right)$$

Where Ac = Sectional area of concrete in sq. ins.
As = Sectional area of steel pipe in sq. ins.
L = Length of column in ins.
R = Radius of gyration of combined sections
$\frac{L}{R}$ is never to be greater than 160
Weight of concrete to be 150 lb. cu. ft.

Approval

Crex Patent columns are approved by the building departments of all large cities.

Adaptability

Crex Patent columns are used extensively in factories, apartment buildings, stores, etc.

Prices, etc.

Quotations and any additional information furnished on request.

Installations

Crex columns have been installed in thousands of buildings in various parts of the United States. This fact gives proof of the economy, reliability and fine appearance of Crex columns.

ESTABLISHED 1897

LALLY COLUMN CO.

Manufacturers of Concrete Filled Columns

CAMBRIDGE, MASS.

FACTORIES

CHICAGO, ILL., 4001 Wentworth Avenue CAMBRIDGE, MASS., Erie and Albany Streets BROOKLYN, N. Y., 211-249 Lombardy Street

Products

LALLY COLUMNS with patented Steel Connections and Bracketed Caps securely fastened, making a rigid tie between beams and columns.

Patents

Various improvements on Lally columns are covered by numerous patents under different dates extending from 1898 to the present time.

Infringements will be prosecuted.

Manufacturing Process

LALLY COLUMNS are manufactured by the LALLY COLUMN CO., INC., of New York, the LALLY COLUMN CO., Cambridge, Mass,, and the LALLY COLUMN CO. of Chicago, representing an annual production of hundreds of thousands of columns.

The column is a *shop-made* unit manufactured under the most thorough and careful supervision and inspection, and is shipped to the job ready for erection.

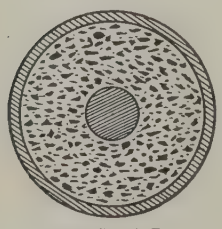
Standard tested mild steel pipes, 3½ to 12¾ inches outside diameter, are cut to the lengths required by plans and specifications, slotted to receive beam connections and splice plates, set up perpendicular on level bases and held in a vertical position by lateral supports. A machine-mixed stone concrete fill is deposited in the shell and, to insure dense concrete, shaft is agitated before initial set takes place by an electric hammer operated on exterior of pipe. The vibration compacts the concrete, liberates the confined air and eliminates all air holes and cavities in the aggregate. The resulting material is of considerably greater compressive strength than ordinary cast-in-the-field concrete. When seasoned, the column is lifted out of position, sandpapered on the exterior surface to remove all cement, and then painted.

Reinforcements for Lally Columns

To meet various requirements, including the amount of load to be carried, Lally columns can be reinforced as shown in the accompanying illustrations.

In all cases the concrete is *compressed,* eliminating all air voids (Fig. 1).

Outer Shell Filled with Compressed Concrete



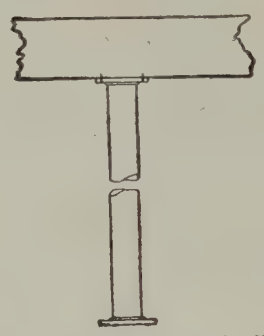
Single Steel Bar Reinforcement

Pipe Reinforcement

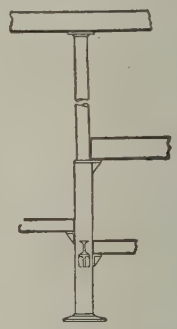
Four Angle Iron Reinforcement

Fig. 1. Sectional Views Showing Manner of Reinforcement of Lally Columns

Note: The angle iron reinforcement above makes a compact fireproof column; column is designed so that load is carried by the four angle irons and concrete within radius of same; outer shell and outer concrete act as fireproofing, making a column practically indestructible



Plain, with Ordinary Plate for Wood Beam Connection



With Beam Supports at Different Elevations

Fig. 2. Types of Lally Columns

Bracket and Beam Support

Where one column sets over the other, our latest construction of bracket and beam support is used, as shown in Fig. 3. This style of cap consists of crown plate and steel bracket inserted through slots in column shaft and firmly affixed thereto.

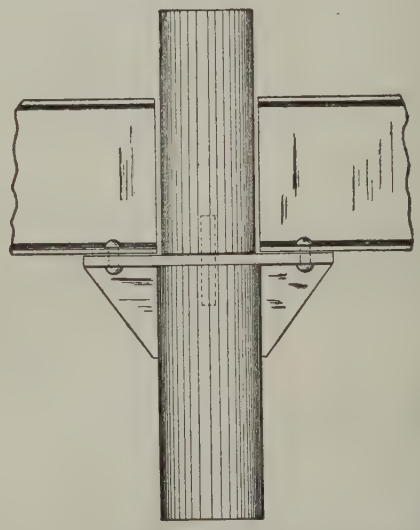


Fig. 3. Steel Bracket and Beam Support

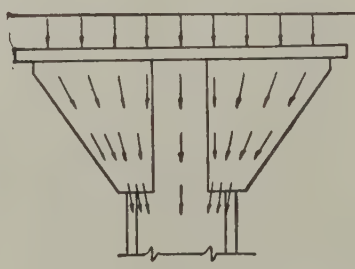

Fig. 4. Steel

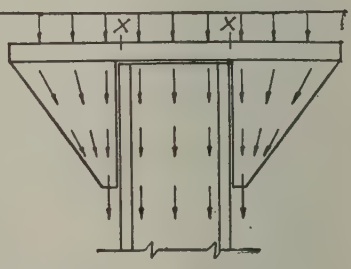

Fig. 5. Cast Iron

Bracket Caps

Fig. 4. Cross section of a typical Lally steel bracket cap showing diagrammatically with arrows how all the load on the cap plate is distributed to the column, eliminating the chance of failure due to improper distribution of the load

Fig. 5. Cross section of a typical loose cast iron cap showing by means of arrows that only part of the load is distributed directly to the column, thereby causing failure by shear at the points marked "x." Load between points "x—x" is the only load carried by the column

Continued on next page

Approvals

The Lally column is endorsed by engineers throughout the country, and approvals have been granted for its use by all the leading city building departments after extensive tests and investigations. Its adaptability to all forms of building construction, its economy in first cost and in floor space occupied, its speed of erection, as well as its strength, durability and practical performance, have been demonstrated by successful and uniformly satisfactory use under especially severe conditions.

Fire Resistance

The value of the Lally column in fire resisting construction has been frequently demonstrated both in actual fires and scientifically conducted fire tests. This type of column section, without additional exterior protection, has withstood the flames and high temperatures of some of the greatest fires; such as the Chelsea conflagration in April, 1908, the Salem fire in June, 1914, the Standard Oil fire at Greenpoint, N. Y., in September, 1919, and the fire in the Edison Phonograph Works at West Orange, N. J., in December, 1914. In this latter fire, large pieces of steel and cast iron melted in the same building in which concrete-filled pipe columns were used and there were evidences of exposed concrete having been fused. The defect produced on the concrete-filled steel pipe columns was a slight lateral bend which was generally less than 1 inch. A complete report on the fire in the Edison Phonograph Works was prepared under the joint auspices of the National Fire Protection Association and the National Board of Fire Underwriters and gives in detail the effects of fire on the various materials which entered into the construction.

In the Underwriters' Laboratories at Chicago, Ill., 1917-1919, two types of Lally columns were tested in a series of fire tests of structural steel, reinforced concrete, steel pipe and cast iron columns. The Lally columns were unprotected on the exterior surface. These columns were tested under Standard time-temperature fire curve conditions while supporting loads in excess of the recommended design loads. As a result of the tests, the comparative fire resisting ratings of Lally columns were determined as 25 minutes for the unreinforced, which was 11% overloaded during the test, and 45 minutes for the reinforced section, which was 3% overloaded during the test. Actual test runs were 36 minutes and 1 hour 11¾ minutes, respectively. Compared to these ratings, unprotected structural steel and round cast iron columns were granted tentative ratings of only 10 and 20 minutes, respectively. Lally column ratings would probably have been still further increased if the test loads had not exceeded the safe working values recommended.

Safe Loads

We call attention to a material change in the safe loads, as shown in the table below, increasing the accepted safe loads for Lally columns. Please bear in mind that when a project is designed for Lally columns according to this strength list *they* should be specified, and no other concrete filled column substituted unless the sizes are increased to a diameter that will be equal in carrying capacity to the genuine Lally columns.

References

The names and addresses of the principal purchasers and satisfied users of Lally columns will be furnished on request.

SAFE LOADS FOR LALLY CONCRETE FILLED COLUMNS IN THOUSANDS OF POUNDS

CLEVELAND, OHIO

BRANCH OFFICES

NEW YORK, N. Y., 16 Warren Street
PHILADELPHIA, PA., 2216 W. Columbia Avenue
NEW ORLEANS, LA., 1508 Masonic Temple Building
BOSTON, MASS., 88 Broad Street

Products

"DUPLEX" JOIST, WALL, CONCRETE BLOCK and I-BEAM HANGER; "DUPLEX" POST CAPS, POST BASES, WALL PLATES and WALL BOXES, for warehouses, factories, heavy mill construction and all other wood constructed buildings.

For Incinerators, see page C4085.

Specifications

"Duplex" hangers and post caps are designed with a large factor of safety to carry the timbers for which they are intended. If architects and engineers will, when using hangers and post caps, specify "Duplex," the proper hangers and post caps for the timbers will be furnished.

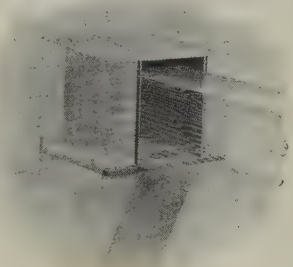
"Duplex" Hangers

"Duplex" Joist Hanger

Single Joist Hangers—Are made of malleable iron and every hanger is thoroughly tested.

The best and most economical hangers for timber framing.

"Duplex" Joist Hangers reduce the shrinkage of joists to a minimum.



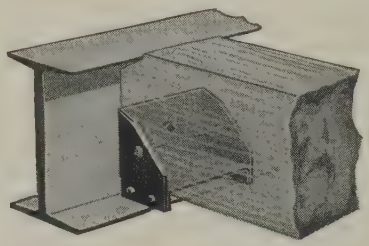
"Duplex" Wall Joist Box

"Duplex" Concrete Block Joist Hanger—The best hanger for concrete block construction. It is made with a larger bearing plate than our ordinary wall hangers so as to distribute the load over a greater area of the concrete block. Very practical where it becomes necessary to frame joists into old brick walls or party walls. Avoids the cutting of a large hole.

"Duplex" Concrete Block Wall Joist Hanger

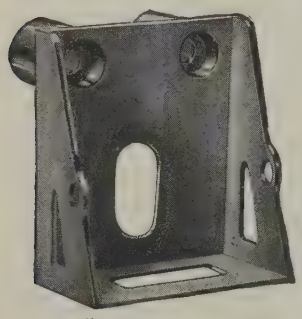
R & L Joist Hangers—The best hangers for the heaviest type of mill construction. By using this type of hanger, the entire building is tied together laterally. No other method of construction does this. Made in two parts and can be adjusted to fit the various timbers for which they are intended.

R & L Joist Hanger



"Duplex" I-beam Shelf Hanger

I-beam Box and I-beam Shelf Hangers—Are noted for being one of the most economical devices for framing wood joists to I-beams. All of the load is carried on the lower flange of the I-beam, this being the only correct method.



For Very Heavy Mill Construction

Heavy Duty R & L Joist Hangers—This hanger combines all the features of the R & L hangers, but is made in one piece, instead of pairs.

Wall Hangers—Embody every established requirement for good construction. Superior in design. Do not break the bond in masonry walls. Self-releasing in case of fire.

"Duplex" Wall Joist Hanger

"Duplex" Steel Post Caps

The "Duplex" Post Caps are made of mild, open hearth steel and consist of three pieces; a bearing bracket and two side plates bolted together with four heavy bolts. All engineers who have investigated and used this cap are unanimous in declaring it to be the best design for rigid construction. Tests have fully proven the great strength of this design and that it is not possible to break the cap when even more than six times the ultimate safe load of the timber is applied.

These caps are furnished for 1-way, 2-way, 3-way and 4-way construction and may be had for timbers larger than the post.

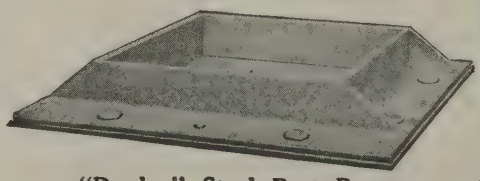
Four-way Construction

"Duplex" Wall Hanger, Extra Heavy
"Underwriters' Type." For heavy mill construction

Steel Wall Hangers—Have no equal in carrying timbers clear of the wall. Distribute the load perfectly over the bearing surface of the masonry. Furnished for standard and extra heavy construction.

"Duplex" Steel Post Bases

Are made of steel plates and angles to fit the post. More economical than cast iron plates.



"Duplex" Steel Post Base

Girder Same Size as Post Below

THE IDEAL HANGER COMPANY

1270 East 53d Street
CLEVELAND, OHIO

Products

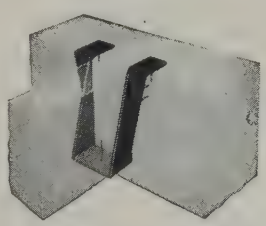
IDEAL JOIST HANGERS (Wall Hangers, Wall Boxes and Metal Lumber Hangers); POST CAPS; POST BASES.

Also Barn Framing Fittings.

Ideal Joist Hangers

Introduction—Ideal hangers are made of the best grade open hearth steel bars and are formed so the hanger fits flat against the timber, increasing the carrying capacity of the hanger. This hanger fitting close on all sides does not interfere with furring and permits the use of spikes or lag screws to fasten the hanger to the girder.

No costly framing. Easily applied and neat in appearance. The same section of bar is used throughout, giving the strongest construction at an economical cost.



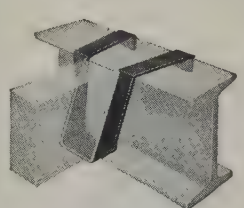
Ideal Single Hanger, Style "A"

Single Hanger, Style "A"—These hangers are standard construction and are carried in stock for every size timber.

Ideal Double Hanger, Style "B"

Double Hanger, Style "B"—For use where joists frame opposite each other on wood or I-beam girders. The double hanger consists of two single hangers, each riveted to strap connections to hang over the wood or I-beam girder. Unquestionably, the strongest construction.

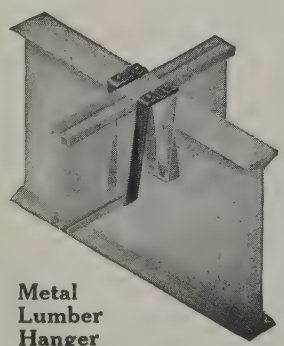
Directions for Ordering—Give size of joists and also width of girder over which hanger must span, or, in case of an I-beam, exact width of flange, or if more convenient, height of I-beam and weight per foot, so that flange width can be obtained.



Ideal Single Hanger, Style "C"

Single Hanger, Style "C"—Used where a single joist frames against an I-beam channel or wood girder, the arms of the joist hanger running over the top.

Directions for Ordering—Give size of joist and dimensions over which hanger arms must go, namely: width of timber header, or, in case of I-beams or channels, width of flange or height and weight per foot so flange width can be obtained.



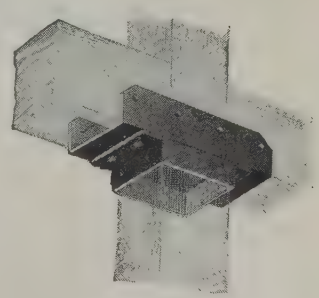
Metal Lumber Hanger

Metal Lumber Hangers—Are the most economical and satisfactory method of framing steel I-joists and save from 60 to 75% of the cost of shelf angles. Being a shop-fabricated product of known strength and integrity, the use of Ideal metal lumber hangers follows the simplest possible design. Easily placed, safe, strong and secure. Send plans for estimate.

Ideal Steel Post Caps

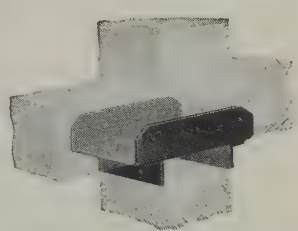
Cap No. 2—Combines all the features necessary to strength in construction. Easily installed, no framing being necessary. The angles on the bottom of the cap are bent to form a socket into which the post fits, preventing any twisting of the cap. Channel is of open hearth plate steel riveted to the socket. Brackets are riveted to channel to carry beams framing on the side. Girders and beams will be flush unless otherwise noted.

Directions for Ordering—In ordering 3 or 4-way construction, give the following information: size post below; size post above; width and height of main girder; width and height of beams on side of cap.



Ideal Steel Post Cap No. 2

Cap No. 3—Forms a complete bearing channel for the girder. Heavy angles underneath give necessary strength for lighter type of construction. Holes are punched in the cap for tying the girders and post to the cap. This cap permits the use of wider or smaller girders than the post. Furnished in any size from warehouse stock.

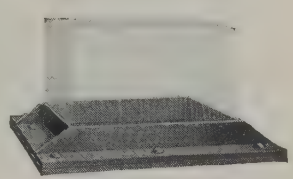


Ideal Steel Post Cap No. 3

Directions for Ordering—Always give size of post on which cap is placed, size of post which rests on top of cap and size of girder.

Ideal Post Bases

Made of heavy steel plates with angles riveted on to form a socket for the post, providing necessary spread for standard construction.



Ideal Post Base

Service

Ideal post caps, Ideal hangers and other Ideal products are made of the best material obtainable by competent workmen on modern machines. Prompt shipments are made from stock. Estimates and quotations cheerfully furnished and designs submitted by engineers who are specialists in timber construction.

THE SAMUEL J. CRESWELL IRON WORKS

Twenty-third and Cherry Streets
PHILADELPHIA, PA.

Products

ARCHITECTURAL WROUGHT and CAST IRON WORK, and GENERAL FOUNDRY WORK, including Columns, Stairways (straight and spiral), Wheel Guards, Standards, Manhole Doors and Frames, Fenders, Roadway Drain Grates and Frames, Vault Plates and Frames, Ash Pit Doors and Frames, Cleanout Doors and Frames, Trench Covers and Frames, Cesspools, Drain Gutters, Pavement Doors, Gates and Grilles, Post Caps, Railings, etc.

Facilities

THE SAMUEL J. CRESWELL IRON WORKS is one of the largest and best equipped plants in the vicinity of Philadelphia for the production of the various kinds of architectural wrought and cast iron work mentioned above. Further, this company is prepared to submit estimates, or designs and estimates, for any ornamental work for large or small buildings, etc., on short notice.

General Foundry Work

In addition to architectural work, a fully equipped foundry is prepared to produce special castings and do general foundry work, including cast iron ornamental or plain columns from stock designs (sent on request) or to architects' designs.

Stock Specialties

The accompanying illustrations show a few specialties regularly carried in stock. The prices quoted are f. o. b. Philadelphia.

ESTABLISHED 1882

FLOCKHART FOUNDRY CO.

Engineers and Manufacturers of Standardized Constructors' Castings

MAIN OFFICE

87 Polk Street, NEWARK, N. J.

Products

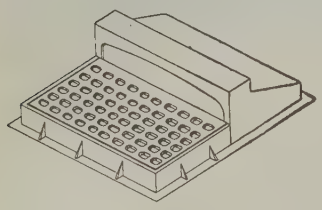
A complete line of CONTRACTORS' CASTINGS adapted for construction of highways, water works, storm and sanitary sewers, sewage disposal works, docks, gas and electric plants, etc.

Engineering Service

We maintain a specialized engineering service for the solution of particular problems. Service is rendered without charge to customers.

Data Sheets

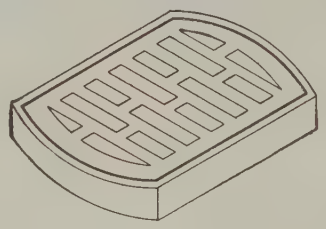
Data sheets are issued for all our products. These show all detail dimensions and other necessary information for ordering and installing. Write for them by number and description of product.



No. 25128

Large Curb Inlet

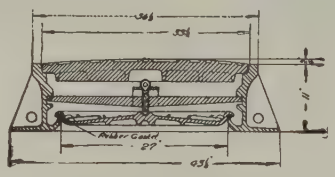
Strong design with heavily reinforced grating. Curb piece any height or radius. Grating, 48x22 in. Same type with grating 34½x21 and 29½x49 in.



No. 25277

Frame and Grating for Park Use

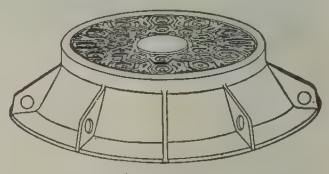
Size, 25x18 in. Depth, 2 in.



No. 26287

Waterproof Type of Manhole Frame and Cover

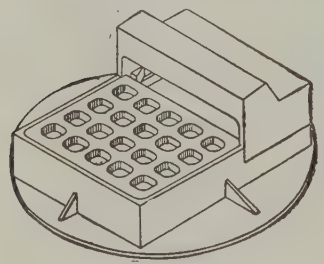
With rubber gasket and lock. Flange diameter, 46½ in. Minimum opening, 30 and 27 in. Also with high flange. Circular or square flange



No. 26293

Heavy Frame and Cover for Electrical Subways

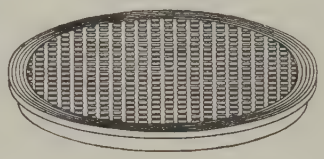
Flange diameter, 43 in. Minimum opening, 24 in. Depth, 10 in. Also 27 and 30-in. diameter openings



No. 25263

Small Curb Inlet

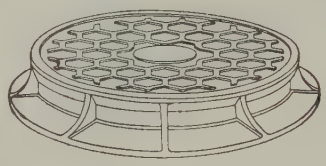
Curb piece any height or radius. Grating, 22¾x19¼ in. Plane or concave grating



No. 25054

Ring and Cover

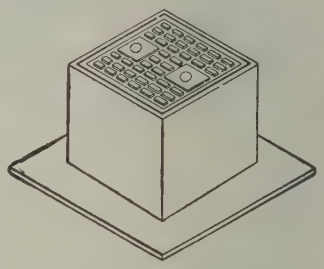
Diameter, 16, 18, 20, 22, 24, 30, 36 and 42 in. Made for light or heavy traffic



No. 25206

Heavy Manhole Frame and Cover

Flange diameter, 48⅜ in. Minimum opening, 36 in. Depth, 8 in. Also with minimum opening of 24, 30 and 42 in. The 36 and 42-in. sizes made with double concentric covers



No. 25403

Heavy Monument Box or Protection for Water or Gas Line Valves

Flange, 17 in. square. Minimum opening, 8⅝ in. Depth, 9 in. Also in light type

DICKINSON CAST IRON EXHAUST HEADS.

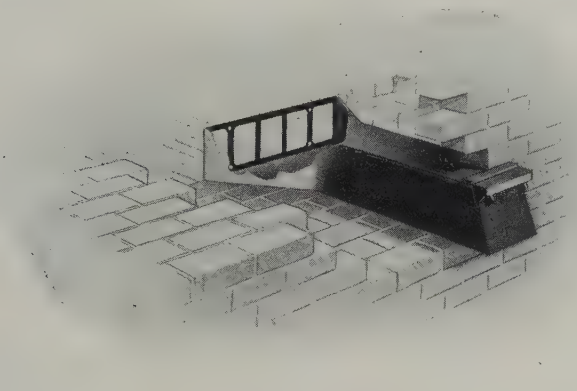
For "Æolus" Ventilators and Dickinson Floor Vents, Mushroom Type, see page A614.

Dickinson Cast Iron Scuppers

Reduce insurance rates 2% to 5% on contents of buildings to which applied.

They are constructed of light gray cast iron and are simple, effective, durable and easily installed.

The portion which protrudes beyond the wall is covered by a hinged flap which is held in place by a hinge pin of bronze to prevent corrosion and consequent sticking.



Cast Iron Scupper

Inside grating prevents clogging with papers, etc.
Outside grating prevents birds from building nests to block the purpose of the scupper

Size—Underwriters' requirements call for 15 sq. in. for each 1000 sq. ft. drained. Dickinson scuppers have a capacity of 16 sq. in. at the smallest point. The outside or smaller end is 4x4 in.

List Price—Dickinson scuppers may be had for the following thicknesses of wall:

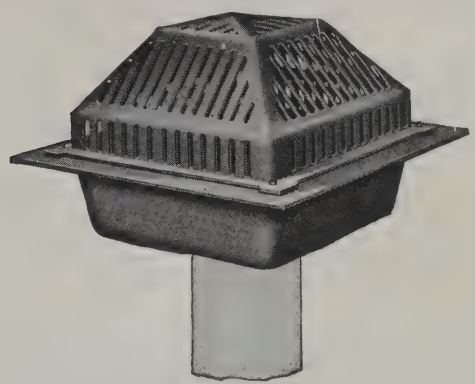
9-in. wall	$3.30
13-in. wall	4.40
17-in. wall	5.50
22-in. wall	6.60
24-in. wall	7.70

Prices are f.o.b. Chicago.

Specifications—Furnish and install where shown on plans gray cast iron scuppers which are to have outlet of 4x4 in., as manufactured by ÆOLUS DICKINSON, 3324-3354 South Artesian Ave., Chicago, Ill. Inlet to have a protective grating and outside to have a flap hinged on a bronze pin. The bottom edge of the inside end shall be set at the level of the floor or slightly below it so that water will drain clear. Scuppers must have a pitch of from 2 to 2½ in. to the foot. Upon completion of the building and before being turned over to the owners, the contractor shall see that all scuppers are clear of all material, are clean and that the hinged flap moves freely and is in perfect working order.

Dickinson Cast Iron Roof Drains

Constructed of light gray cast iron.
All sizes for threaded and cast iron pipe.



Cast Iron Roof Drain

Top: 12 in. square, 6 in. high.
Bottom section: 16½ in. square, 4 in. deep.
Roofing felt is brought over flange

Dickinson Cast Iron Exhaust Heads

Dickinson exhaust heads are the only make constructed entirely of cast iron. They are simple in design, yet none the less effective in operation. On entering the head the gradually expanding steam strikes the concave surface of an inner shell which quickly reverses its direction. Then the steam flows upward along the sides until it strikes the top, where it is again deflected and is permitted to exhaust into the outside air. Constantly impinged against these inner surfaces, the particles of oil and water are separated from the steam vapor leaving nothing but the dry vapor to escape.

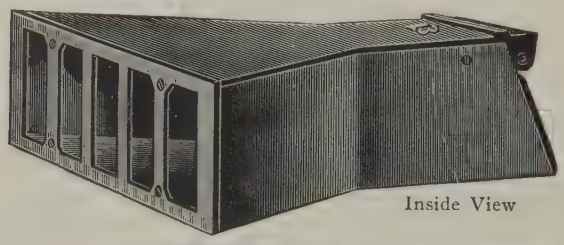
Also Reinforcing Steel, Wire Mesh, Beam Wrapping, Spirals, Spacers, Griptite Sleeper Anchors.

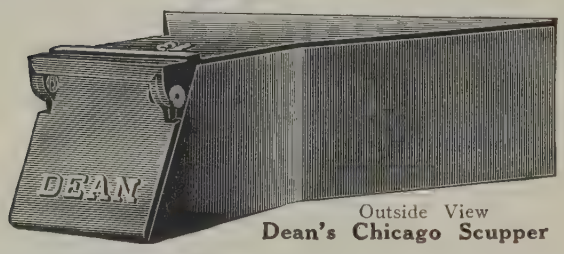
Dean's Chicago Scuppers

Advantages—Windproof and rainproof, designed to meet the requirements of the National Board of Fire Underwriters. Reduce insurance rates 3 to 5 per cent. Initial cost low in comparison to this annual saving. Reduce water losses and interruption to business in case of fire by draining the water directly to the outside of the building. Protect goods on the floor in case of breaks in water or sprinkler system. Protect wood floors from standing water.

Therefore use scuppers in every building.



Inside View



Outside View

Dean's Chicago Scupper

Construction—Our Chicago scupper has 48-sq. in. capacity at the inlet and 16-sq. in. capacity at the outlet.

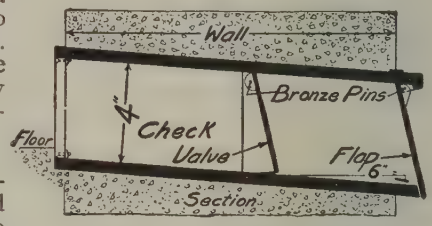
The wide inlet increases the water pressure on the flap at the outlet. This flap is hung on bronze pins at such an angle that its weight holds it snug against the walls of the scupper making it windtight and watertight, but a very small flow of water from within will open it. A small shelf projecting from the outside of the scupper protects the hinges and valve from clogging with mortar, dirt or ice. The grating within prevents clogging from the inside of the building and allows a clear inspection of the interior of the scupper at all times.

Check Valve—While the careful fitting of the outer flap makes the Chicago scupper windproof, we can, if desired, insert an additional check valve in the box.

Fender

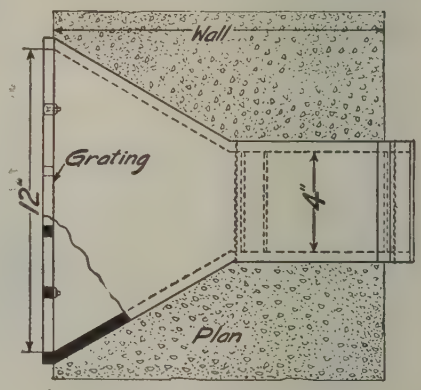
For certain building contents the Underwriters recommend a projection on the inside face of the scupper to prevent close stock piling. In such cases we equip our scupper with a grating carrying such a projection.

Installation—The National Fire Protection Association recommends under ordinary conditions, one scupper having an outlet area of 16 sq. in. to every 1000 sq. ft. of floor, or, in a building equipped with a sprinkler system, one to every 500 sq. ft. of floor. The Dean Chicago Type Scupper complies fully with this recommendation.



Specification—

The mason contractor shall furnish and set one Dean Chicago Type Scupper in each bay of the exterior wall as shown on plans. The scuppers are to meet the recommendations of the National Board of Fire Underwriters, having well fitted and non-clogging outside flaps hung on bronze pins and removable inside gratings. They shall have inlets at least 12 in. wide and outlet areas of at least 16 sq. in. Care must be taken in setting the scuppers to see that the pitch is not less than 2 in. in 12 in., that the lower inside edges of scuppers are set 1 in. below finished floor line, and that scuppers are set true to wall lines and are not sprung or broken during construction work.



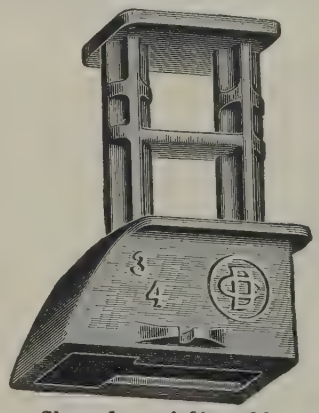
Section and Plan of Dean's Chicago Scupper

On completion of the job, flaps must be cleaned and left in perfect working order and all exposed parts of scuppers are to be cleaned and given a heavy coat of paint.

Service

A complete stock of all sizes of scuppers is kept in the Chicago warehouse.

Chicago being centrally located with exceptionally good package car service on all railroads, delivery can be made within a few days' time to all points. This is an important consideration in regard to scuppers, as they are very often forgotten until actually needed on the job.



Slotted or Adjustable

DEAN'S CONCRETE INSERTS

WATERTITE DRAIN & SCUPPER CO., INC.

Windproof Hooded Scuppers

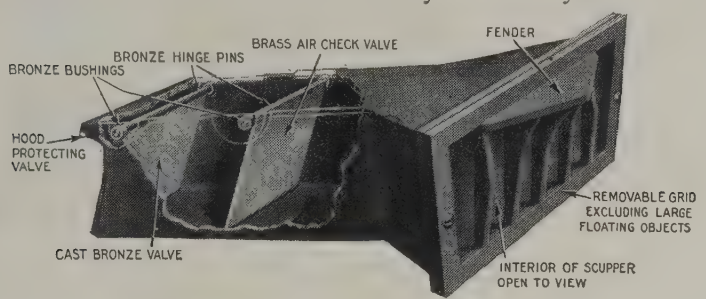
243 East 44th Street, NEW YORK, N. Y.

AGENTS IN MANY CITIES

Purpose of Scuppers

It is a well-known fact that water damage often exceeds the fire damage and also causes large losses through disruption of business. A small fire on an upper floor may cause enormous damage to goods, machinery, etc., by flooding the floors below. Scuppers allow this water to escape outside the building and save this enormous and unnecessary loss.

Underwriters recommend the use of scuppers (especially in sprinklered buildings) and the insurance rate for both owner and tenants is favorably affected by their use.



Type R Windproof Hooded Scupper with Double Air Check, Removable Grid and Fender

Underwriters' Approval Is Your Guarantee

Our scuppers have been tested, approved and listed as standard by the Chicago Laboratories of the National Board of Fire Underwriters. This secures their acceptance by all local exchanges and the maximum allowance in the rate.

The Factory Mutual Laboratories have also approved our scupper when provided with a large hood enclosing the valve on the three sides ("complete hood").

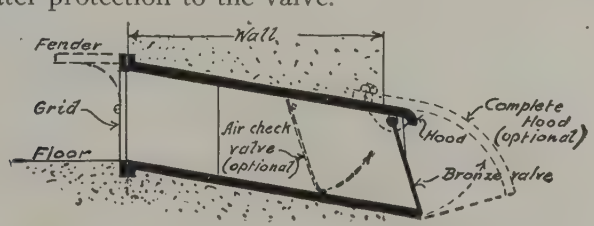
Construction of Type R Scupper

Windproof Valve—Box of cast iron, outlet 4x4 in., inlet 12 in. wide. To exclude cold air, a heavy cast bronze valve is hung in bronze bushings overlapping the outer end of the scupper.

The locating of the valve in this manner provides for its free action, which cannot be expected from a valve recessed in the scupper mouth subject to clogging by incrustations of dirt or sealing by ice or sleet. As the scupper is an emergency device it must be ready to function always, else it is useless.

The inner air check valve is not a necessity, as our outer valve is well fitted and effectively excludes cold air.

Hood—A small hood protects the valve from being clogged by mortar during construction, and from dirt and ice. If desired, we can furnish the "complete hood," enclosing the valve on three sides. This form is favored by New England Underwriters, as giving greater protection to the valve.



Section Through Type R Scupper

Grid—The grid protecting the inlet is removable, being secured by two brass setscrews.

Fender—The fender projecting 1½ in. into the room is designed to prevent storing goods against the inlet of the scupper. Fender can be omitted, if desired.

Pitch—Our scupper has a downward pitch of 2 in. to the foot, providing a good head of water to open the valve.

Discharge Capacity—Tests made by Underwriters' Laboratories developed that our scupper will discharge 60 gallons per minute under 1-in. head of water on the floor and 100 gallons per minute under 3-in. head.

Necessity of Bronze Fittings—As the scuppers may not be called into use until years after they have been installed it is necessary that the valve be of a material not subject to rust—our valve is of bronze hung in bronze bushings.

For Wood Floors on Cement

A special scupper is made for wood floors laid on sleepers bedded in the cement slab. The inlet is 7 in. high and the bottom of the scupper is set flush with the cement floor to take off any water that might seep through the wood floor.

Number Required

In sprinklered buildings, provide one scupper to every 500 sq. ft. of floor surface. In unsprinklered buildings one to every 1000 sq. ft. Scuppers are usually placed in the curtain walls below the windows.

Sizes and Prices

The scuppers are made for any thickness of wall and prices will be quoted on application. State thickness of wall and type of scupper required, also quantity.

Specification for Type R (Approved) Scuppers

Furnish and set in exterior walls, where indicated, cast iron scuppers with inlet not less than 12 in. wide, outlet to have an area of not less than 16 sq. in.; outlet to have a cast bronze gravity valve overlapping the end of the scupper (not recessed). Valve shall be hung in bronze or brass bushings. Above the inlet there shall be a cast iron fender extending 1½ in. into the room (can be omitted if floors are not for storage purposes). All iron parts shall have one coat protective paint (or be galvanized) before shipping. Scuppers shall have the approval of the National Board of Fire Underwriters and be included in their list of Approved Mechanical Devices. All as manufactured by the WATERTITE DRAIN & SCUPPER CO., INC., 243 East 44th Street, New York, N. Y.

Set the scuppers about 1 in. below the finished floor line. Grade a channel to it in the cement finish of the floor.

Purpose of Windshield Scuppers

To provide a quick escape for water in case of fire, defective or overheated sprinklers, bursting pipes, etc., thereby reducing damage to a minimum.

It is a well-known fact that approximately 75% of so-called fire losses are actually caused by water, and the progressive architect or engineer can not afford to omit provision for the emergency. Aside from actual water damage, five lines of fire hose, discharging 300 gal. per minute, would strain the structure to the extent of 12,000 lb. for each minute, or 30 tons every 5 minutes the fire ensued.

Every mercantile building, such as warehouses, factories, lofts and stores, should be equipped with Windshield Scuppers.

Reduced Insurance Rates

Insurance companies, recognizing their value, allow a reduction in rates applying to both building and contents when Windshield Scuppers are installed in accordance with recommendations. This saving usually pays their entire cost in a few years. Buildings so equipped will also command a higher rental and reduce vacancies on account of the insurance saving afforded tenants.

Underwriters' and Factory Mutuals' Approval

Windshield Scuppers have been tested and approved by the Underwriters' Laboratories, Inc. at Chicago, and are listed as Standard by the National Board of Fire Underwriters. This assures acceptance by all insurance exchanges throughout the country and the maximum reduction in rates.

The Associated Factory Mutual Fire Insurance Companies have also inspected and approved this device.

Value of the Improved Windshield

Being an emergency device, it is essential that it be at all times prepared for instant duty. A scupper which permits drafts to enter is not likely to be ready when called upon, as it has been found that employees, putting their own comfort ahead of any thought of the consequence, will stuff the scupper, thereby rendering it useless. The *windshield positively prevents drafts.* This also means a distinct saving in heat and fuel.

The Standard Type Windshield Scupper, as recently improved, is provided with a seat which insures a tight fit when windshield is closed and gives a positive clearance between the sides of the casing. The windshield is hung on a frame at the floor level, where it can be readily inspected and by the removal of two nuts can be replaced. This is an exclusive feature of the Standard Type. (See illustration.)

Underwriters' Approved Grate

The approved projecting grate prevents close stock piling and is so designed as to avoid possibility of tripping or injury to occupants. Its construction is such that a packing case, dropped from a hand truck, would be deflected.

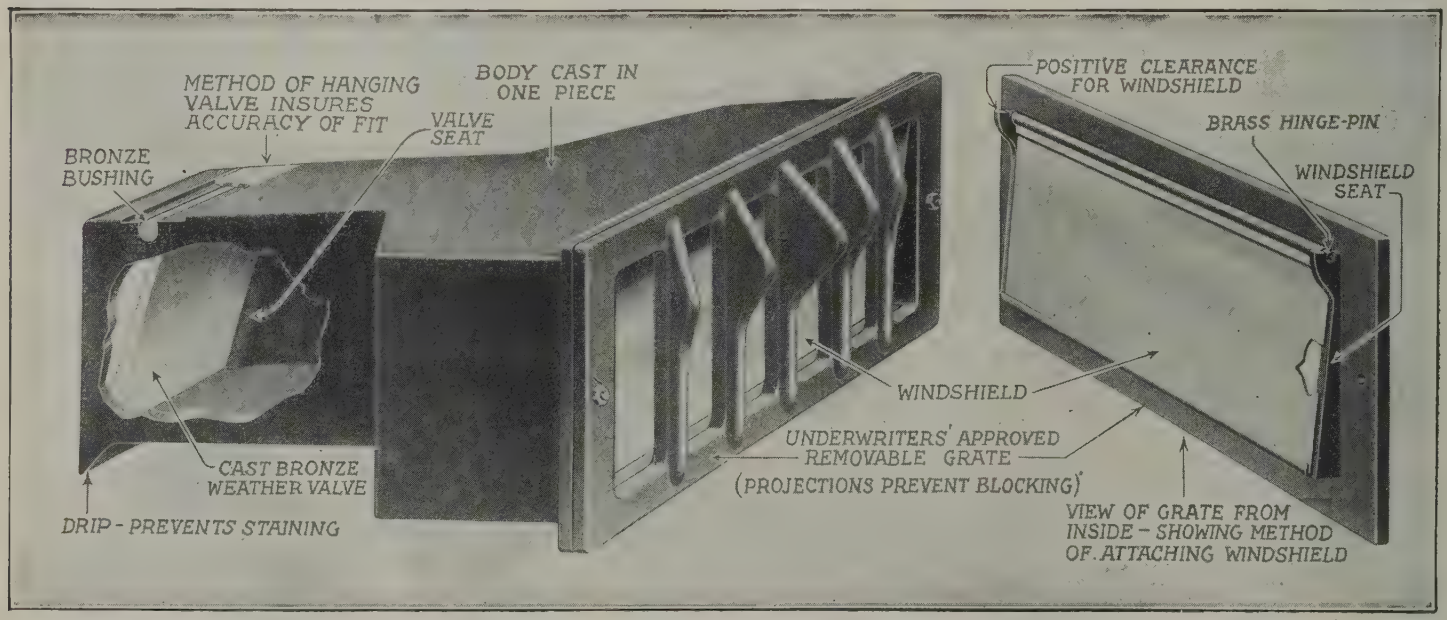
These improvements eliminate the disadvantages of the old style stock fender, which, while readily subject to breakage, can not be replaced as the attaching bolts are embedded in masonry.

Distinct Advantage of One-piece Scupper

The body of every Windshield Scupper is a solid one-piece casting. This is far superior to an assembled scupper, with the top or cover cast separately, as it is impractical to provide a tight fit, and this not infrequently permits a leakage of concrete into the scupper which clogs the valves, rendering them inoperative. The one-piece scupper assures proper setting in a complete unit, requiring no re-assembly of parts on the job by inexperienced mechanics.

Other Structural Advantages

The exterior bronze weather valve, being hung inside the housing, is afforded the maximum of protection against the elements. The method of hanging assures accuracy of fit, making it as airtight as is possible, and the bronze bushings



"Standard Type" Windshield Scupper with Underwriters' Grate, Showing How Windshield Can Be Renewed
(Patented July 28, 1914 and March 27, 1928)

Continued on next page

guarantee ease of operation. It can not be blown open, as is possible with the old type door which rests on the outer end.

The drip under the outlet gives positive assurance against water flowing back under the scupper and staining the building.

Each valve is provided with a seat. It is obvious that a valve without a seat can not be windproof and still operate freely.

Only the best grade, high-silicon iron is used, producing a soft tough casting and, being ⅜ in. thick, ample strength is provided to withstand undue strain or blow imposed by careless handling.

Appearance

Windshield Scuppers, having no unsightly hood at the exterior, harmonize with the architecture of the building. When located symmetrically, they provide a relief and aid the architectural scheme.

Location and Quantity Required

Windshield Scuppers are usually placed in each bay, and should be set in the wall so bottom of scupper will be 1 in. below the finished floor line. By keeping the face of the scupper parallel with the wall, proper incline toward outside will be maintained.

One Windshield Scupper should be provided for each 500 sq. ft. of floor space if the building is sprinklered, otherwise one for each 1000 sq. ft.

Sizes and Prices

Windshield Scuppers are made for walls of any thickness and can be furnished galvanized, if desired. Prices will be quoted on request by local sales representatives, or direct.

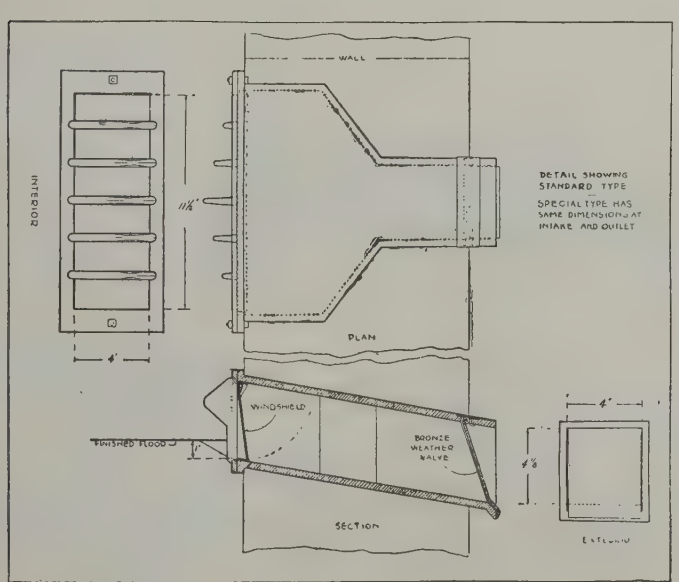
Specification for Standard Type

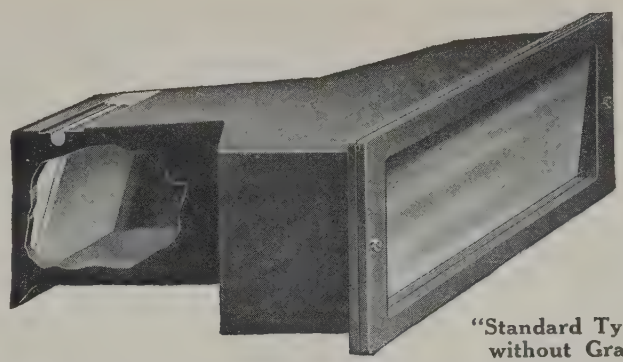
Provide and install, where shown in plans Standard Type (*SG, S, KG or K*) Windshield Scupper, of proper size for wall thickness shown. Body to be cast in one piece, ⅜ in. thick, with bronze exterior weather valve, hung with bronze hinge pins and bronze bushings. To have improved, detachable (*polished brass or galvanized iron*) windshield hung on brass hinge pin, attached to grate or frame at entrance so that it can be replaced (*and with Underwriters' Approved Projecting Grate to prevent blocking.*)

(Italics denote optional features, which should conform to type selected. See Guide below.)

SPECIFICATION DATA

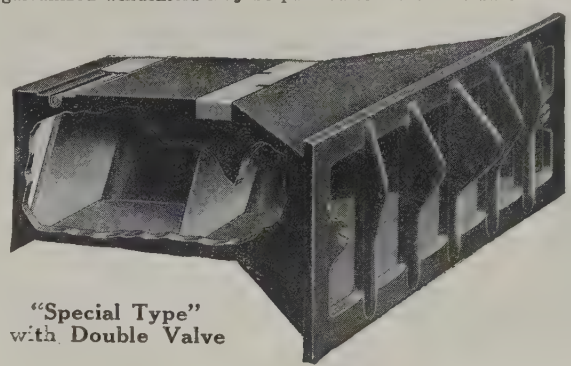
Symbol	Description	
Standard Type, Heavy ⅜ in.		
"SG" "S"	With grate Without grate	Polished, lacquered brass windshield
"KG" "K"	With grate Without grate	Galvanized windshield
Special Type ¼ in.		
"E" "M"	With grate With grate	Double valve Single valve





"Standard Type" without Grate

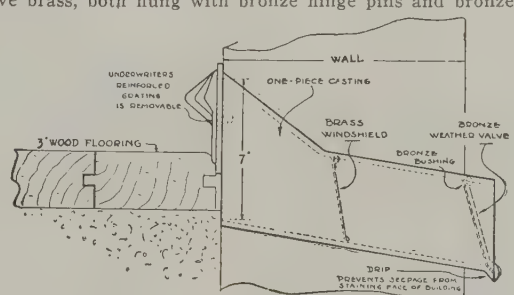
In department stores, and similar high class buildings, architects have shown a preference for the Standard type without grate, as the polished and lacquered brass windshield gives the base a finished, neat appearance, or the galvanized windshield may be painted to match the base



"Special Type" with Double Valve

While lighter than the Standard, compares favorably in weight with any other manufacture and is priced to meet competition. The following advantages place it in a preferred position:

Cast and cored in one piece; exterior drip prevents staining; every valve provided with seat; Underwriters' approved projecting grate furnished at no additional cost, flat grate optional; exterior valve cast bronze, inner valve brass, both hung with bronze hinge pins and bronze bushings.



Type "W" for Wood Floor on Concrete

Note that removability of grate is not obstructed by flooring. Can be furnished with double or single valve

ESTABLISHED 1895

THE DONLEY BROTHERS CO.

INCORPORATED 1911

Building Specialties

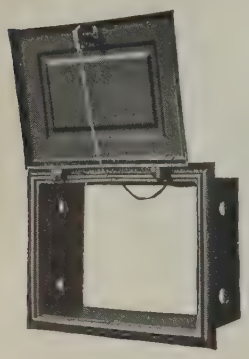
13932 Miles Avenue, CLEVELAND, OHIO

Products

Donley Package Receivers; Coal Chutes; Ash Dumps; Fireplace Dampers; Ash Pit Doors; Fire Baskets; Andirons; Meter Boxes; Garbage Receivers; Mail Receivers and other Building Specialties.

Donley Coal Chute

Replaces old-fashioned, battered coal windows. Protects foundation and siding. Locks when closed. Unlocks from within by pulling chain outside of coal bin. Burglar-proof. Frames of unbreakable, malleable iron. Solid metal doors of copper-bearing steel, close fitting and rust-resisting. Glass doors protected by steel shield when open. Body of heavy weight, rust-resisting copper-bearing steel, reinforced upper edge. Hinges and latch of malleable iron. Latch and chain attachment galvanized against rust. Entire chute has neat, attractive design.



Donley Coal Chute

The No. 19 coal chute has body and moulded frame of copper steel. The door is made of attractive paneled steel. Hinges and lock are of durable malleable iron. In appearance it is very similar to No. 29 or No. 213.

Description	Wall opening, in.	Straight body for 9-in. wall	Slanted bottom body for 13-in. wall	Slanted bottom body for 17-in. wall

Glass door, cast iron, glass panel	32x22	.....	No. 713	No. 717*

*Hopper optional. Hopper weights: small, 11 lb.; large, 19 lb.

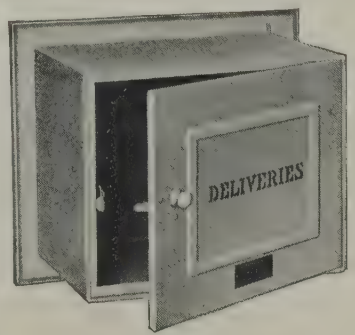
Grade Line Coal Chute—For low set and terraced residences. Also frequently used for stores. This improved chute has provision for drainage. Drain has a strainer and can be connected with sewer. Constructed with checkered steel door, malleable iron frame and reinforced steel chute. Latch and chain galvanized.

Donley Package Receiver

A steel receptacle built into the outer wall of kitchen, for delivery of groceries, etc. Outer door locks automatically when closed; released automatically when inner door is opened. Installation detail furnished with every receiver.

Facing the inside door, No. 1 has hinges on the left, No. 2 on the right and No. 3 reversible. Nos. 1 and 2 have automatic lock. No. 3 no automatic lock. See following page.

Approved by Good Housekeeping Institute.



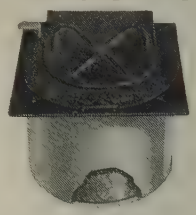
Donley Package Receiver

Size: Outside height 11⅛ in.; width, 14⅛ in.; wall depth, 9 and 6 in.

Donley Underground Garbage Receiver

Prevents nuisances arising from ordinary garbage can. Consists of outer shell and inner receptacle that can be removed for emptying. Service lid of parkerized steel operated by foot lever, which fits snugly, excluding flies. Made in 6, 10, 14, and 21-gal. capacities.

Approved by Good Housekeeping Institute.



Donley Garbage Receiver

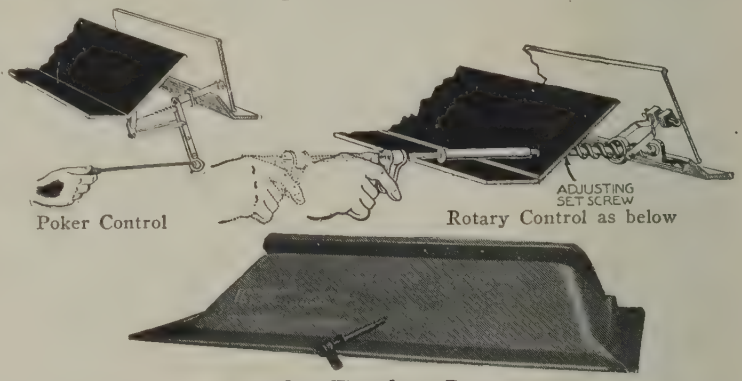
Donley Electric Meter Box

A steel cabinet built into basement wall where service wire enters. Supplied with 3-pole, 60-amp., 250-volt safety switch operated from basement. Meter read through glass pane from outside.

Large inner and outer doors. Height, 13½ in.; width, 16½ in.; wall depth, 10⅝ in.; shipping weight, 45 lbs.

Donley Fireplace Damper

A correctly formed throat and draft regulator combined, the Donley damper simplifies correct fireplace construction and promotes clean, economical fires through proper draft regulation. Two types of control, as shown. *See following page for correct damper size and table dimensions.* For intermediate size openings use next largest damper.



Poker Control

Rotary Control as below

Donley Fireplace Damper

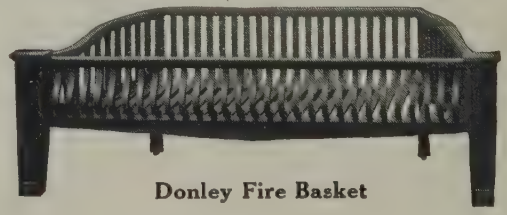
Dampers crated separately. Instructions for building fireplaces and installing dampers attached to crate.

Donley Fire Basket

Meets demand for beautiful, substantial fire basket co-ordinated to wall angle that radiates most heat, as shown in plans on following page. Basket has removable ends.

Made in 24, 28, 30, 34 and 40-in. sizes with respective shipping weights of 58, 64, 66, 73 and 86 lb.

Depth of each, 15 in.



Donley Fire Basket

Donley Ash Dumps

Are iron trap doors in the hearth above the ash pit. Automatic, self-closing dumps are 5x7 in. in size. The common dumps are 5x8 and 7x10 in.

The most convenient method of ash disposal.

Automatic Dump

GABRIEL STEEL COMPANY

Manufacturers of Rolled Steel Products

2441 Bellevue Avenue, DETROIT, MICH.

Products

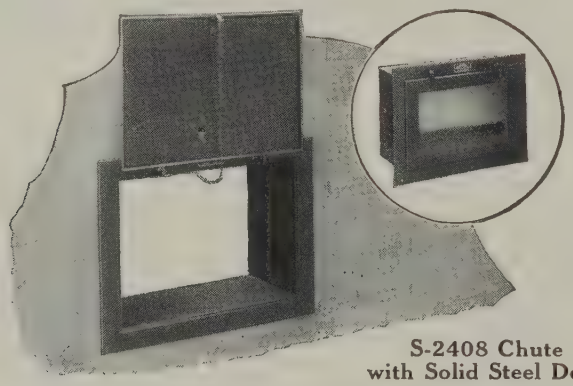
GABRIEL ROLLED STEEL COAL CHUTES; ASH PIT DOORS; DOME DAMPERS; FIREPLACE ASH DUMPS; PACKAGE RECEIVERS; APARTMENT GARBAGE RECEIVERS.

For Steel Joists, see page A665.

GABRIEL ROLLED STEEL PRODUCTS

Gabriel Rolled Steel Coal Chute

The Gabriel coal chute is neat and attractive in appearance. Made of rust resisting copper-bearing rolled steel, which entirely eliminates broken hinges, doors or frames. All fittings Parkerized to insure against rust. Joints are electrically welded throughout. Hinges are of very heavy rolled steel and designed to hold the door in a vertical position when open. Automatic spring latch is made of heavy rolled steel. Hopper is easily attached or removed, and is designed to lie perfectly flat on bottom of chute when not in use. Equipped with roller and chain attachment which permits of operation from any point desired.



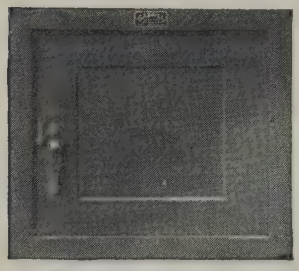
S-2408 Chute with Solid Steel Door

Insert shows G-2408 Chute with wire reinforced glass door

Furnished either with rolled steel or glazed door. In the glazed doors, ¼-in. glass is attached by means of special glazing clips. Glass is bedded and face puttied and protected on the inside by heavy wire guard.

Sizes: 16x24 and 22x32 in. for 8, 12½, and 17-in. walls.

Gabriel Package Receivers



Package Receiver Inside Door

Neat, inconspicuous and weathertight. Design and quality insure satisfactory operation year after year. Made of heavy rolled steel plate, with two latched doors —one outside and one inside. Handles designed to permit installation in an inverted position, if necessary. Made for 12x14-in. wall opening. Width permits installation between studs of standard spacing, 16 in. on centers. Body of receiver is made in three depths: 5, 9 and 13 in.

Gabriel Ash Pit Door

Made entirely of rust resisting, rolled steel. Door and frame are true fitting, insuring practically an airtight closure. Frame of door is electrically welded and door is a single piece of heavy rolled steel plate.

Ash Pit Door

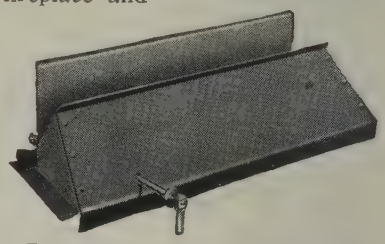
A deep lug anchor is turned up at each of the four corners to facilitate installation and insure secure anchorage in chimney.

The hinges and keeper are practically unbreakable.

Made in four sizes: 8x8, 8x10, 10x12 and 12x16 in.

Gabriel Rolled Steel Dome Damper

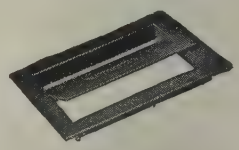
The Gabriel dome damper accurately controls the draft, promotes cleanliness, saves fuel and is conveniently operated. Its vertical front flange permits its use regardless of the construction of the fireplace and seals the joint between the rough brick and the fireplace facing. It is substantially constructed, operated with ease, stays in position and can be had with handle, poker, chain or pushrod operation. Furnished in six sizes: 24, 30, 32, 36, 42 and 48 in., with or without horizontal front angle.



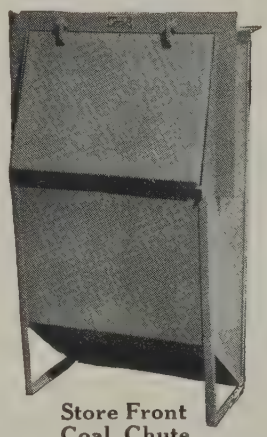
Dome Damper for Fireplaces Showing Handle Operator

Gabriel Ash Dump

The Gabriel ash dump is unbreakable, with an unremovable leaf. Frame is electrically welded, and heavy enough to withstand any usage. It is very neat in appearance and will not warp or twist with use. Made in one size only, 5x7 in.



Gabriel Ash Dump



Store Front Coal Chute

Gabriel Store Front Coal Chute

The same neat, attractive appearance which individualizes other Gabriel products has been incorporated in the construction of Gabriel store front chutes. Copper-bearing rolled steel is used throughout, and all operating parts are parkerized to insure rust prevention.

Chain operating device permits operation from any point. Burglar-proof lock securely fastens automatically when the door is closed.

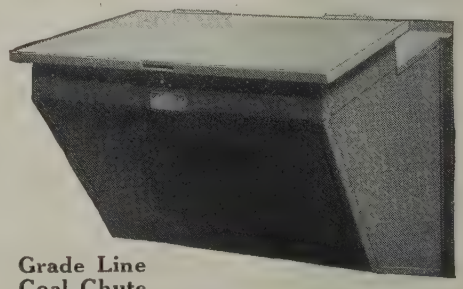
Size: 24x16-in. opening, boot 12 in. deep.

Gabriel Grade Line Coal Chute

Constructed throughout from heavy copper-bearing rolled steel, which is practically unbreakable. All joints are electrically welded. There are no bolts or rivets to work loose. Hinge pins are solid brass.

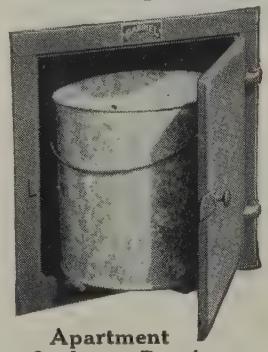
The practical design, careful workmanship and rugged strength incorporated in the construction of this chute are decidedly evident upon inspection.

Size: 27x21-in. opening, boot 16 in. deep.



Grade Line Coal Chute

Gabriel Apartment Garbage Receiver



Apartment Garbage Receiver

This garbage receiver consists of a heavy copper-steel frame and door with a boot which bricks into the wall. A heavy galvanized garbage pail having a capacity of 5 gal. is furnished. A hinged shelf, for the support of the pail, is solidly connected to the frame and swings outward when the door is opened. The entire weight of the container is carried on the rigid frame. Heavy rolled steel hinges and a rugged catch make up the hardware for this product. Size: width 15½ in., height 15½ in., depth 10 in.

W. H. TAYLOR COMPANY

Manufacturers of Copper Steel Coal Chutes

326 S. W. 11th Street
DES MOINES, IOWA

Products

TAYLOR-DES MOINES COPPER STEEL COAL CHUTES, SOLID STEEL DOOR, DAYLIGHT DOOR, COMBINATION HOPPER-DOOR, GRADE LINE and STORE.

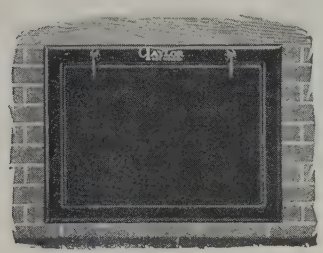
Also Flue Cleanout or Ash Pit Doors and Fireplace Ash Dumps.

For Steel Basement Windows, see page A1293.

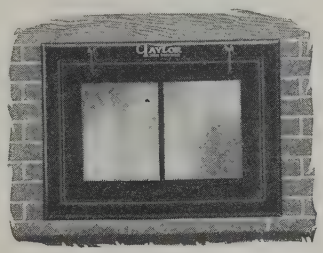
Taylor-Des Moines Coal Chutes

Rust-resisting copper steel is used in all Taylor-Des Moines Coal Chutes. All fabrication is by the electric arc welding process. The frames are welded at all corners, bodies are welded to frames and all fittings are welded on. Heavy steel is used, with frames, doors and hoppers, strongly reinforced—warranted break proof.

Chute bodies are oversize in depth to provide protection for the masonry opening. Bodies are made 8½ in. deep for 8-in. walls, 13 in. for 12-in. walls, and 18 in. for 16-in. walls. Chutes with 8½-in. bodies have flat bottoms, 13 and 18-in. sizes have sloping bottoms.



Solid Steel Door

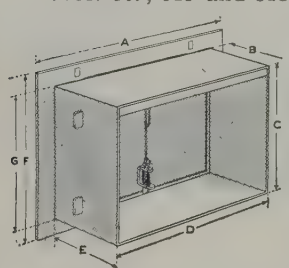


Daylight Door

Large anchor plates, 1¾x¾ in. are welded to ends of all door and hopper chutes. Hopper chutes have additional anchors on top at rear of the body to take care of the extra outward thrust.

Solid Steel Door Chutes—Used where no hopper is required. The extra deep flange around the edge of the door, ⅞ in. over all, provides ample reinforcement and improved appearance. The door is held open automatically by the slotted hinges. When closed, a strong spring latch locks it securely.

Made in 3 sizes:
Nos. 109 (9-in. depth) and 113 (13-in. depth), 24x17 in.
Nos. 209, 213 and 218 (9, 13 and 18-in. depths, respectively), 26x22 in.
Nos. 309, 313 and 318 (9, 13 and 18-in. depths) 35½x22 in.



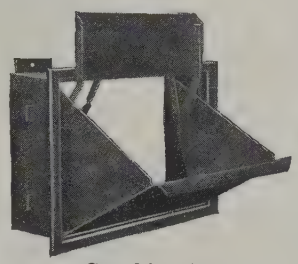
Daylight Door Chutes—Meet the double requirements of protection and light. The heavy wire glass (¼ in. thick) is protected by a steel shield when the door is open and which rests on the sill when closed. Glass is set in heavy rubber channel and may be replaced by simply removing four bolts. In all other respects it is identical with the Solid Steel Door Chute. Can be furnished with a hopper.

Made in 3 sizes similar to the solid steel door Chute:
Nos. 709 and 713, 24x17 in.
Nos. 809, 813 and 818, 26x22 in.
Nos. 909, 913 and 918, 35½x22 in.

COAL CHUTE DIMENSIONS IN INCHES

Solid Steel Door Chutes, Daylight Door Chutes, Combination Hopper-Door Chutes. (Letters refer to drawing.)
Note: Last two digits in No. refer to wall thickness.

Solid door No.	Hopper type No.	Daylight No.	A	B	C	D	E	F	G	Wall opening Width	Wall opening Height
109	409	709	25¼	8½	16	21½	8½	19¾	16	24	17
113	413	713	25¼	13	17¾	21½	13¼	19¾	16	24	17
209	509	809	29¼	8½	21¾	25½	8½	25⅜	21¾	26	22
213	513	813	29¼	13	23½	25½	13½	25⅜	21¾	26	22
218	518	818	29¼	18	23½	25½	18¼	25⅜	21¾	26	22
309	609	909	38¾	8½	21¾	35	8½	25⅜	21¾	35½	22
313	613	913	38¾	13	23½	35	13½	25⅜	21¾	35½	22
318	618	918	38¾	18	23½	35	18¼	25⅜	21¾	35½	22



Combination Hopper-Door Chute

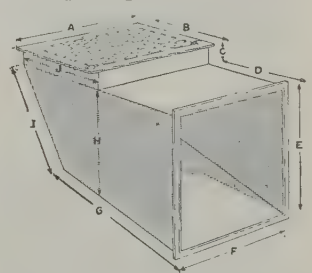
Combination Hopper-Door Chutes—Supply the demand for a hopper-chute. A steel shield provides protection above the opening and folds into the hopper when closed. The hopper bottom is No. 10 gauge steel and is arc welded to the wings. Reinforced at its upper end by a steel angle. Fastened to the frame by means of a rod welded to the lower edge of the hopper and intersecting the frame.

In hopper chutes there is an extra outward thrust at the top where the hopper is secured, which shakes the chute loose more easily. Taylor-Des Moines Hopper-Door Chutes have extra anchorage to overcome this, placed at the rear edge on top and have holes through which they may be spiked to the sill plate in frame buildings.

Made in 3 sizes:
Nos. 409 and 413, 24x17 in.
Nos. 509, 513 and 518, 26x22 in.
Nos. 609, 613 and 618, 35½x22 in.

Grade Line Chutes—*(Oversize.)* For use where floor line is low. Have the advantage over the store type, of a larger clear opening. Door is made of safety tread floor plate, wings prevent scattering of fuel, catch holds the door open and it locks automatically when closed. The heavy copper steel body is reinforced at the rear opening. Note liberal dimensions.

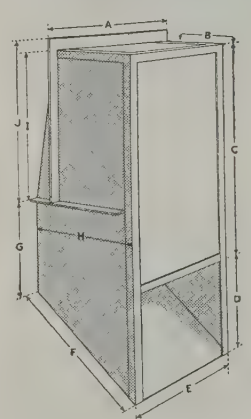
Made in two sizes:
No. 40, 24x20-in. door opening
No. 41, 30x26-in. door opening



DIMENSIONS IN INCHES

No.	Door opening Width	Door opening Depth	Wall opening Width	Wall opening Depth
40	24	20	25	28
41	30	26	31	34½

No.	A	B	C	D	E	F	G	H	I	J
40	28¼	24¼	3	16	27½	24½	29	21	20	20¾
41	34¼	30¼	3	18	34	30½	36	27½	27½	26¾



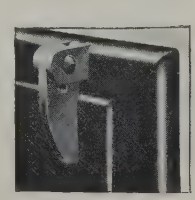
Store Chutes—*(Oversize.)* Used in business buildings, where the floor line is level with the sidewalk. Fuel is delivered to the opening at a sharp angle, therefore Taylor-Des Moines Store Chutes have larger doors than usual in this type. The door is held open automatically, and locks automatically when closed.

Made in two sizes:
No. 50, 25x21-in. door opening
No. 51, 31x25-in. door opening

STORE CHUTE DIMENSIONS IN INCHES

No.	Door opening	Wall opening	A	B	C	D	E	F	G	H	I	J
50	25x21	26x49	28¾	12	32	17	25¾	18½	18	16	21½	23½
51	31x25	32x53	34½	12	34	18	31	18¾	18	16	24	25¾

Frame, Door and Hinge Construction



All assembly is by the electric arc welding process. All joints are welded and all fittings are welded on. Hinges pass through frame and door and are welded at the back, out of sight. This method makes for better appearance as well as greater stiffness and freedom from rivet troubles. The steel frame is reinforced by a double flange, which presents a smooth curved front.

These chutes are made of heavy steel throughout, but because of greater strength of steel, the net clear opening for fuel is greater than is possible where iron is used in frames

KEWANEE MANUFACTURING COMPANY

Basement Coal Chutes, Steel Basement Windows and Building Specialties

85 North Tremont Street, KEWANEE, ILL.

Nationally distributed through Dealers in Building Material, Hardware and Structural Steel

Products

KEWANEE COPPER STEEL BASEMENT COAL CHUTES: Window, Store, and Grade Line.

For Kewanee Copper Steel Basement Windows, see page A1190.

General

Kewanee Chutes afford efficient facilities through which to deliver coal to basements of buildings. They withstand hard knocks which shatter ordinary construction, protect the building from damage and defacement, and are simple and convenient to operate. The saving in repair bills alone quickly overcomes the difference in cost between a Kewanee Coal Chute and makeshift arrangements.

All parts, even the rivets, are of heavy Keystone Copper Steel—a special alloy which is not only rust resistant but tougher than ordinary steel. Kewanee Chutes harmonize perfectly with the foundation wall, whether it be of brick, concrete, stone or other material. They can be readily installed in old as well as new buildings.

In order to meet various conditions, Kewanee Chutes are manufactured in three distinct types: Window Chutes, Store Chutes and Grade Line Chutes. Each type is furnished in two standard sizes and one or more styles.

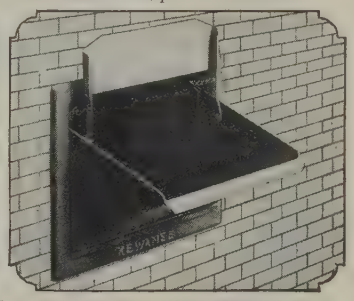
Every Kewanee Coal Chute is *guaranteed* against breakage and warranted to give satisfactory service.

Kewanee Window Coal Chutes

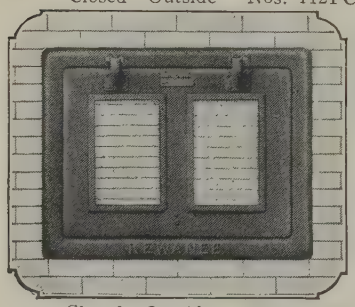
Closed—Outside

Nos. 108P and 208P Open—Outside

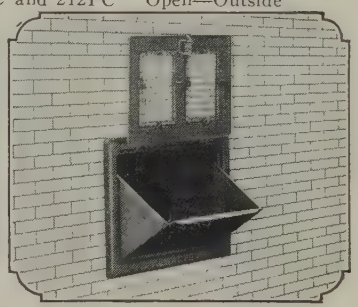
Closed—Outside



Nos. 112PC and 212PC Open—Outside



Closed—Outside



Nos. 112GI and 212GI Open—Outside

Kewanee Window Chutes are the type most commonly used, being designed to take the place of the common basement window in buildings with foundation walls extending sufficiently above the grade line. These chutes are furnished in two sizes—with plain or glass doors, with or without hoppers, and with bodies for 8, 12, 18-in., or thicker, foundation walls.

Three typical styles of Kewanee Window Chutes are illustrated at the left.

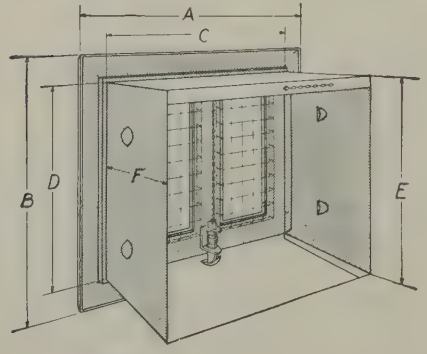
Frame—Frame and bottom of all Kewanee Window Chutes are pressed out of one piece of heavy Copper Steel. Frames of the regular size (the "100" series) chutes have a clear net opening for the delivery of coal 21 in. wide by 15½ in. high, and those of the large size (the "200" series) have a net opening 28 in. wide by 20 in. high.

Body—Kewanee Window Chutes are regularly furnished with flat bottom bodies 8 in. deep or sloping bottom bodies 12 in. deep. Sloping bottom bodies 18 in. or more deep for extra thick foundation walls will be supplied on special orders.

Door—Two styles of doors are supplied, the style P door ("Plain" door), admitting coal alone and the style G door ("Glass" door), for use where light also is required. All top hung doors have slotted hinges which automatically hold the door upright when open.

Hopper—In style PC Chutes ("Plain" door, "Combination" hopper), the door is hinged at the bottom, and in combination with wings, forms a convenient and substantial hopper for the reception of coal. The shield for protecting the wall above is automatically raised and lowered with the opening and closing of door. In style GI Chutes ("Glass" door, "Independent" hopper), the hopper is independent of the door. A chute with hopper prevents scattering and is desirable where coal will be shoveled in directly, or delivered in bag, basket or wheelbarrow.

Lock—All styles of Kewanee Window Chutes lock automatically and positively. By attaching a chain or cord the lock can be easily operated from any place in the building.



No.	Size known as	Door	Hopper	Dimensions in inches A	B	C	D	E	F	Net and ship. wt., lbs.

Advantages of Kewanee Window Chute Construction

(The glass door chute is chosen for reference as the style best illustrating the various features of Kewanee construction.)

(1) Stronger glass door construction—two smaller glass panels instead of a single large one. Panels simply and efficiently protected during coal delivery by heavy wire guards, readily removed for cleaning glass.

(2) Pressure on glass is evenly distributed—retaining clips bear on a steel binding angle and not directly on the panels, which are cushioned in putty.

(3) Lock is actuated positively by a strong spring, not by gravity.

(4) Appearance is clean-cut and attractive—the smooth lines of Kewanee Chutes are due to pressed steel construction.

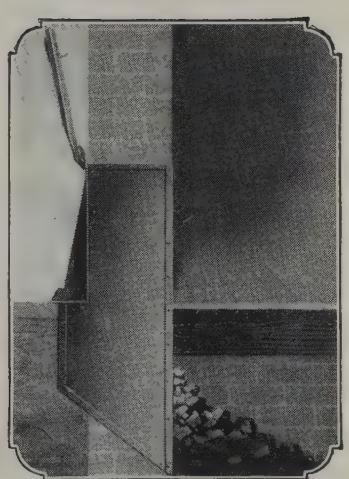
(5) The rugged, pressed steel hinges are slotted so as to automatically hold the door up when in the open position.

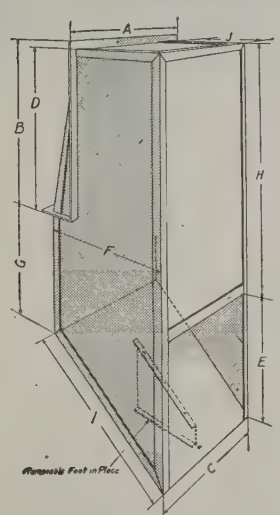
(6) Greater throw-in space for coal—the pressed steel frame is less bulky than brittle cast iron. The maximum throw-in space is particularly important in the regular size chute.

(7) Bottom of body, where wear is greatest, formed out of same piece of heavy Copper Steel as the frame. All parts, even the rivets, are made out of this rust-resistant alloy.

The Kewanee line also includes plain door chutes of exceptionally strong and simple hopper construction, *opened and closed by a simple pull or push.*

Kewanee Store Coal Chutes





Kewanee Store Chutes are adapted for use in buildings where the first floor is too near the ground level to permit the installation of the regular window type of chute.

These chutes are provided with convenient and automatic locking arrangements same as Kewanee Window Chutes. Slotted hinges hold the door open. A foot attached to the sloping bottom supports the chute in upright position while the foundation wall is being built around it.

No.	Hopper	Dimensions in inches										Net and ship. wt., lbs.
		A	B	C	D	E	F	G	H	I	J

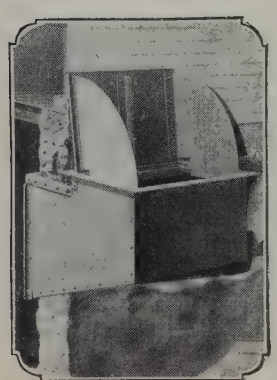
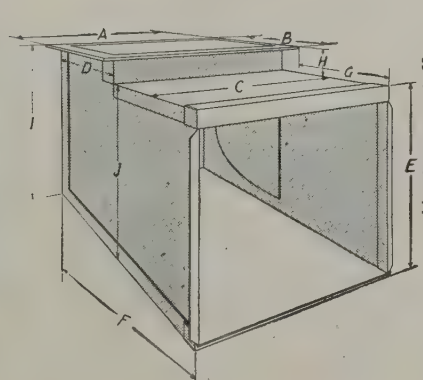
32-PI	Independent	34½	26	31½	24	17	16½	18	34	18	12	190

Kewanee Grade Line Coal Chutes





Kewanee Grade Line Chutes are another type designed for buildings with low first-floor levels. An upwardly projecting lip extends around the edge of the frame opening. The door, with anti-slip surface, closes down over this lip, thus preventing the entrance of water. The door is held open by a catch, and locks automatically when closed.

Majestic Coal Windows

This popular, sturdy window has won universal preference because of the protection it gives to the entire opening and sidewall when coal is being deposited in the bin. It gives the greatest protection to the building *above* the window where it is most needed—thus it saves its initial cost many times over and enhances property value by its permanence, sightliness and convenience.

Built for permanent service—will withstand the most severe conditions of usage.

Backed by over 20 years' experience in building quality coal chutes.

Construction

Guaranteed Breakproof Doors—The doors of Majestic coal windows are made of heavy pressed steel, electro-galvanized to resist rust. When raised, the door holds itself open automatically, protecting the building above the opening.

Breakproof Frames—Frames are made of certified malleable iron. They set true in the masonry—no installation difficulties. Frame and door fit snugly, making the window weathertight.

Breakfast Hinges—Hinges are made of certified malleable iron, making breakage at this point a practical impossibility. Hinges are flat with support on each side of the hinge pin. Neat and inconspicuous, eliminating the necessity of cutting the water table to provide hinge clearance.

Reinforced Bodies—Bodies and hoppers are made of Keystone copper steel and heavily reinforced at points of strain. Angle iron reinforcement allows masonry to be laid directly on the body without the use of a lintel.

Burglarproof Automatic Locks—Unfailing burglarproof and troubleproof. Doors are unlatched (from inside only) by a chain which may be extended to any part of the house. Lock drops shut automatically when door is closed.

Styles

Majestic coal windows are made in solid steel and in glass panel styles as follows:

No. M101 (Steel Door Style)—Equipped with sloping bottom body and chain to gravity catch.

Style B has a copper steel hopper for coal delivery with bags or wheelbarrow. Style D is without hopper.

No. M203 is the same as No. M101 but larger in size.

No. M500 (Steel Door Style)—Differs only from No. M101 in that it has a 9-in. straight bottom body, without hopper.

No. M520 is the same as No. M500 but larger in size.

No. M10 (Glass Panel Style)—Used when daylight is desired in the coal bin or basement. Has three lights of ¼-in. plate glass set in a ½-in. angle iron frame with two pressed steel dividing strips to give still more strength. Rubber packing is used instead of putty. The door is heavy, electro-galvanized steel, the glass being protected by a steel shield when open. Otherwise No. M10 is the same as No. M101.

Style A has a hopper.

Style B is without hopper.

No. M20 is the same as No. M10 but is large in size.

No. M600 (Glass Panel Style)—Differs only from No. M10 in that it has a 9-in. straight bottom body, without hopper.

No. M620 is the same as No. M600 but larger in size.

Majestic Coal Chutes

Grade Line Chute

The Majestic grade line coal chute is designed for buildings having little or no foundation above ground, as in low set or terraced homes, apartments, stores and office buildings.

Door swings upward and, when raised, forms part of the hopper and becomes a shield which protects the building when coal is delivered. When closed, the door locks automatically and is burglarproof.

Breakproof construction throughout. Frame, door and hinges are of certified malleable iron, with solid brass pins; body of keystone copper steel, reinforced with angle iron. The door fits snugly over the top of the frame when closed. This feature, with the waterproofing ridge around the inside edge of the frame, gives an absolutely watertight job.

Strong and durable — will outlast any building in which it is installed.

No.	Door opening, in.	Rough wall opening (inches)
M16	23¼x18¼	25 x 25
M18	29x24	31 x 31

Store Chute

The Majestic store coal chute is designed particularly for store and office buildings, where the first floor is on a line with the sidewalk or alley.

It does away with the dangerous sidewalk coalhole and the necessity of putting up a bond for the protection of pedestrians.

Frame and hinges are certified malleable iron; doors of heavy gauge pressed steel, electro-galvanized to resist rust.

Two sizes, with or without hoppers.

On special order, the Majestic store chute can be supplied with a duplex body so that coal can be deposited either under the sidewalk or in the basement as desired.

Majestic Milk and Package Receiver

Designed to hold 6 or more quart bottles of milk, depending on the thickness of the building wall in which it is installed. It consists of two cast iron frames and doors, connected by a steel body, adjustable to the thickness of the wall in which it is placed. Castings and steel body are coated with *bitumastic solution,* the enduring protection against rust.

The burglarproof gravity latch on the outside door can be unlocked only from inside. The kitchen side door is provided with a refrigerator type latch and handle and can not be opened from outside. Doors can be reversed at time of installation—either door can be installed inside or outside to open either to right or left by simply changing the gravity latch from one door to the other.

When the outside door is opened, the chain is drawn outward and held by the friction. This leaves the gravity latch in locking position, and when the door is closed, it locks automatically.

Sizes

Made in two depths of adjustable bodies, adapting them to walls of any thickness.

No. 1 body adjustable to walls from 5 to 8 in. thick; No. 2, from 8 to 14 in. Bodies of special depths furnished at additional cost.

Outside dimensions of package receiver frames, 16¼ in. wide, 14 in. high; wall opening required, 14 in. wide, 12 in. high.

How Operated

A chain attached to gravity latch runs through two cast iron eyes to inside frame, where a cast iron ball is suspended. When empty bottles are placed in receiver, ball is pulled down; its weight, and friction of the chain holds the latch on outside door unlocked. Inside door is then closed and locked by the refrigerator latch.

Majestic Milk and Package Receiver

Majestic Garbage Receivers

Built-in and Apartment Garbage Receivers

5K Built-in Receiver—Front opens into kitchen where garbage is deposited, and back casting opens to some accessible place outside building where garbage is removed. Doors fit closely and lock with a refrigerator type latch. Body is made of heavy gauge steel in two telescoping sections, one fastened to the front casting, the other to the back or outside casting, and body is adjustable for 8 and 12-in. walls. For narrow walls, casings may be used inside and outside.

3A and 5A Apartment Receiver—Consists of a heavy cast iron frame and door, a galvanized iron body which recesses in wall, and a galvanized iron garbage pail which sets on a cast iron shelf fastened to the door. When door is opened, can is ready to receive garbage. Receiver is vented through wall by two 4x2¼-in. heavy cast iron ventilators furnished with each receiver.

9A Apartment Receiver—Has front casting only, with steel body recessed in the wall to receive the garbage can. Front is provided with a hopper garbage door and two doors below for removal of can. Doors fit closely and lock with a refrigerator type latch.

*One galvanized iron garbage can furnished with each receiver.

Underground Garbage Receiver

Offers an out-of-sight, odorless, flyproof, waterproof, sanitary and convenient method of garbage disposal. Consists of a receiver shell made of keystone copper steel, and ring, lid and foot lever of cast iron. Entire receiver is treated to prevent deterioration and formation of rust. Comes complete with either a heavy Majestic corrugated can or an extra heavy Witt corrugated can.

The receiver shell is buried in the ground (in any convenient location) to the upper band. Lid is opened by a slight pressure of the foot on the trip. When foot pressure on trip is released, lid snaps tightly shut and no odors can escape. When can is full, it is easily lifted out.

Supplied in 5, 8, 12, 15 and 20-gal. capacities.

Majestic Underground Garbage Receiver

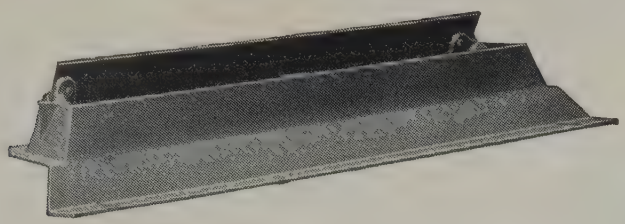
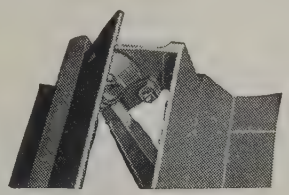
Majestic Fireplace Dampers

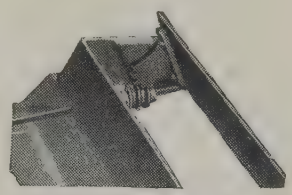
The Majestic damper is scientifically designed, simple in construction, easy to operate and gives perfect draft control. The Majestic throat is theoretically and practically correct, due to the built-in lintel, which assures the correct height of damper throat above finished opening—also correct position of damper. Installed in any reasonably well built fireplace, it insures absolute satisfaction. Smoking in the room is eliminated by the Majestic damper.



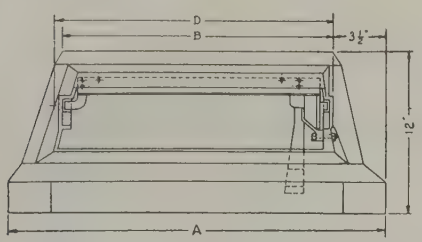
Majestic Fireplace Damper as Installed in Fireplace



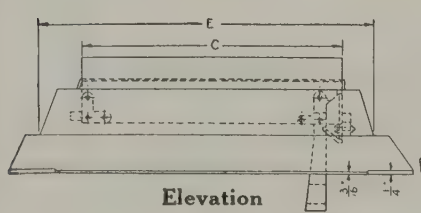
End View Showing Friction Type of Control



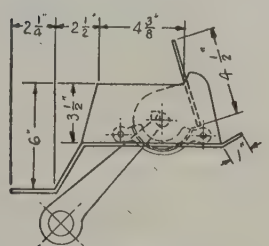
End View Showing Type "X" Control



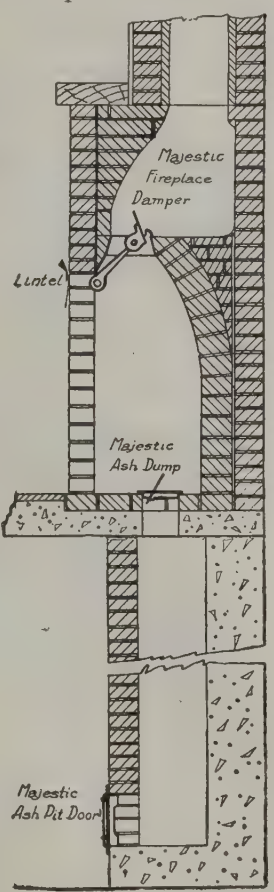
Plan



Elevation



Detail of Damper Operation



Fireplace Section Showing Application of Damper

The making of the lintel integral with the frame of the damper makes it certain that the distance from the top of the opening of the fireplace to the top of the throat is correct—and this is the most important dimension of the whole fireplace. It also makes it necessary to place the damper forward in the fireplace, thus leaving room for a smoke shelf behind.

Ease of operation is accomplished by the *trouble-proof friction principle for opening and closing the door or valve.* The operating lever is out of sight and easily moved forward or backward with a poker, and it stays in position until again adjusted. The throat opening is subject to the best minute adjustment, and there are no knobs or handles to protrude through the front of the fireplace.

The Majestic Type X, however, is supplied for those who prefer the handle or knob control.

The valve or door is hinged at the back, which permits heat to be thrown out into the room, draws the smoke off from the nearest possible distance from the face of the fireplace, and aids the smoke shelf in turning the down-draft back up the chimney.

With the Majestic throat and damper any mason can build a perfect fireplace by following the drawings and instructions furnished with each damper.

YPS

TRADE-MARK

Value of Copper Steel Coal Doors

Steel coal doors have become standard equipment in modern American dwellings. Home owners are demanding them both for the protection of the foundation walls and as a guard against intruders.

The YPS Copper Steel Coal Door is good looking and sturdy. It will prevent the unsightly marring of the window frame so noticeable in the foundation walls of buildings where coal is chuted through the ordinary cellar window.

Most home owners have been through the annoying and expensive experience of broken windows due to coal being chuted through the ordinary frame window. Broken windows are eliminated by the use of YPS Copper Steel Coal Doors.

YPS Coal Door

Style, in.	Wall thickness, in.	Masonry opening, in. width, height	Weight lb.
18 x 24	8	21¾ x 16	46

Details of Construction—All the skill in design which has made an enviable reputation for the YPS designers is brought out in the YPS Coal Door and the quality of materials is up to the high standard which builders all over the country have come to expect in every product of this great YPS plant.

The frame of the YPS Coal Door is one solid piece of deep drawn, heavy copper steel tank plate ⅛ in. thick. The same material is used throughout the door's construction.

The self-closing lock is exceptionally strong, with a heavy spring which insures positive locking when the door is closed. Locks may be equipped with a chain in order to release catch from the floor above.

Unbreakable hinges automatically hold the door, when open, against the foundation to give perfect protection to the wall when the coal is being put in.

Heavily coated with black asphaltum base paint at the factory, the YPS Coal Door comes ready to go into the foundation with the least effort and the greatest amount of satisfaction possible.

YPS Copper Steel Basement Windows

Heavy one-piece frames of YPS basement sash are the stiffest on the market. Hanger hinges, an exclusive feature, permit ready removal or placing of ventilators, though ventilator comes out only when lifted to horizontal. Ventilators and frames are interchangeable; detachable jamb bar strips, new design, can be supplied for brick or stone wall; positive lock is simple, yet unbreakable. YPS sash admits as high as 80% more light than wood sash, and gives greater ventilation when open.

Five standard sizes.

YPS Basement Window

Style No.	Type	Glass size, in.	Masonry opening, in.	Weight, lb.
701	3 light	10 x 12	32¾ x 15¼	18
702	3 light	12 x 18	38¾ x 21¼	23

J. H. BAWDEN & CO.

Manufacturers of Bawden Fireplace Specialties

FREEHOLD, N. J.

Products

DOME DAMPERS, ASH PIT DOORS and ASH TRAPS.

Dome Dampers

Design and Construction—The three types of dome dampers shown are designed with the single idea of efficiency. This has been attained to an unusual degree by so constructing the dampers as to eliminate all pockets or cut-ins, which tend to impede the free passage of the smoke, thus overcoming the principal weakness of the ordinary dome damper. The flange of the damper forms an arch bar of ample strength to support the weight of the masonry above the fireplace.

Operation—Extreme simplicity is the cardinal point in the operation of these dampers. All that is required to operate Styles "A" and "B" is a common poker. Style "C" operates with a straight thrust, by means of a rod through breast or side of fireplace. It contains no cogs, gears, worms or springs in the throat to rust fast or give out. *One damper that never fails to operate.*

LAWNDALE 0140

4644 West Roosevelt Road
CHICAGO, ILL.

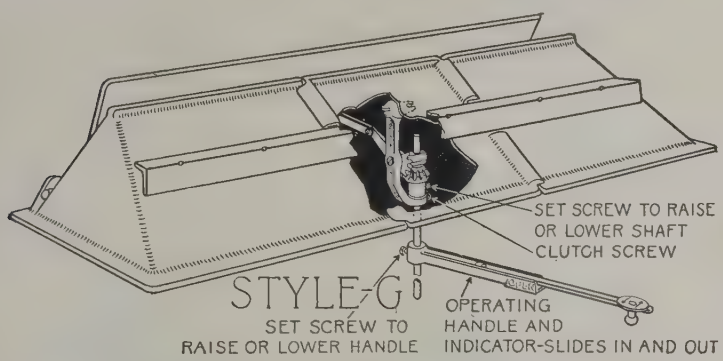
Products and Service

THE IMPROVED COLONIAL HEAD THROAT and DAMPER for Fireplaces; GLO-HOT ELECTRIC GRATE.

Also complete Fireplaces in brick, stone, marble, tile, and wood mantel bases; complete Fireplace Furnishings: Fenders, Grates, Andirons, Fire Sets, Trimmings; Special Brass and Wrought Iron Work for fireplaces.

Colonial Damper Works Right in Any Fireplace

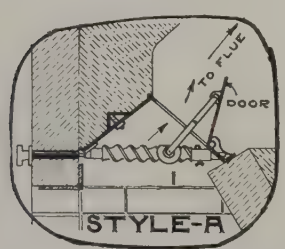
With the new "Style G" lever arm operating device the Colonial Damper may be set one, two or three courses above the opening or even higher with a longer shaft. Operating handle is *out of sight* yet easily accessible. To operate damper door, swing to right or left as indicated on brass plate.



Colonial Damper Takes Up Heat Expansion

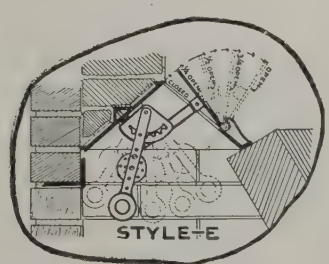
Built in sections of best iron castings reinforced with steel angle bar so as to sustain great weight and intense heat. The overlapping joints between sections take up heat expansion and prevent cracking the face of the fireplace.

Colonial Dampers are available in Styles A, E and G as illustrated. The Colonial Head compels correct formation of the fireplace throat—the vital part—and saves its entire cost in labor. May be used with any type of fireplace, arched or square opening.



Regular Style of Colonial Head Throat and Damper

Key to control draft comes through face of fireplace on left-hand side



Style E

Lever to Control Draft Comes Down in Center of Fireplace

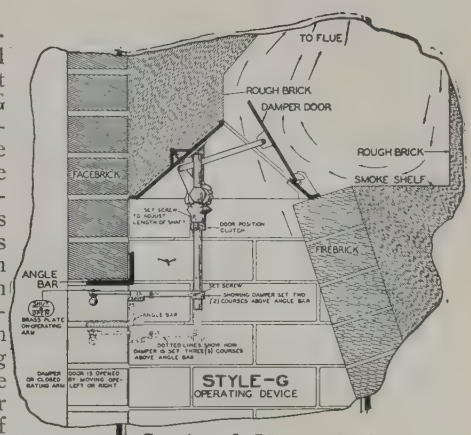
Style G furnished upon adding "swing" to code word.

For genuine fireplaces the Colonial Damper is without a peer. The Style-G operating device perfectly regulates the opening of the throat. The operating handle slides forward and moves right or left to open or close and when the draft is adjusted, slides back again under the opening out of sight. The Colonial Damper backs up beauty of your design with the assurance of successful operation.



Sectional View, Style-G

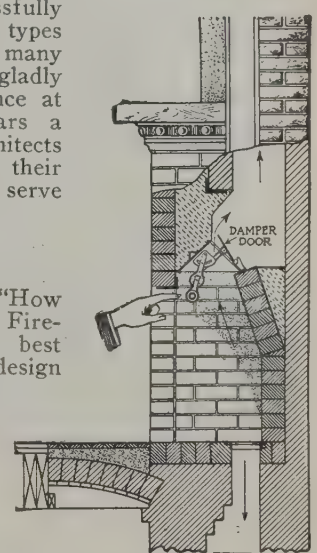
Showing method of operation and adjustments. With this device the Colonial head may be set anywhere in throat as high up as desired

Special Service to Architects and Builders

Through the experience of a quarter of a century we have successfully encountered the difficulties of all types of fireplace construction as well as many unusual conditions, and we will gladly put this knowledge and experience at your command. For many years a growing number of leading architects have written us freely regarding their fireplace problems. We will gladly serve you also.

Fireplace Blue Print Details

A very informative blue print, "How to Avoid Common Mistakes in Fireplace Construction" showing the best and latest practices of correct design sent free on request. Special details if required. Complete catalogue free when requested on business stationery.



Sectional View Showing Position of Style E Damper in Chimney Throat

Glo-Hot No. 261

"Glo-Hot" Electric Fireplace Grate (Patented)

Heats from "Globar" element under hood: radiant heat from the scientifically designed copper reflector, also circulated heat (hot air) over the top of the "Globar," throw all the heat rays straight into the room.

Gives the fascinating flicker as of real fire in glowing coals, and heats as well, without requiring any flue.

Standard size: 1000 watts, 110 volts. Installation requires No. 12 wire on separate circuit. Also in 500-watt and 2000-watt capacities.

The 500-watt size may be connected with ordinary house lighting circuit.

Listed by the Underwriters' Laboratories, Inc.

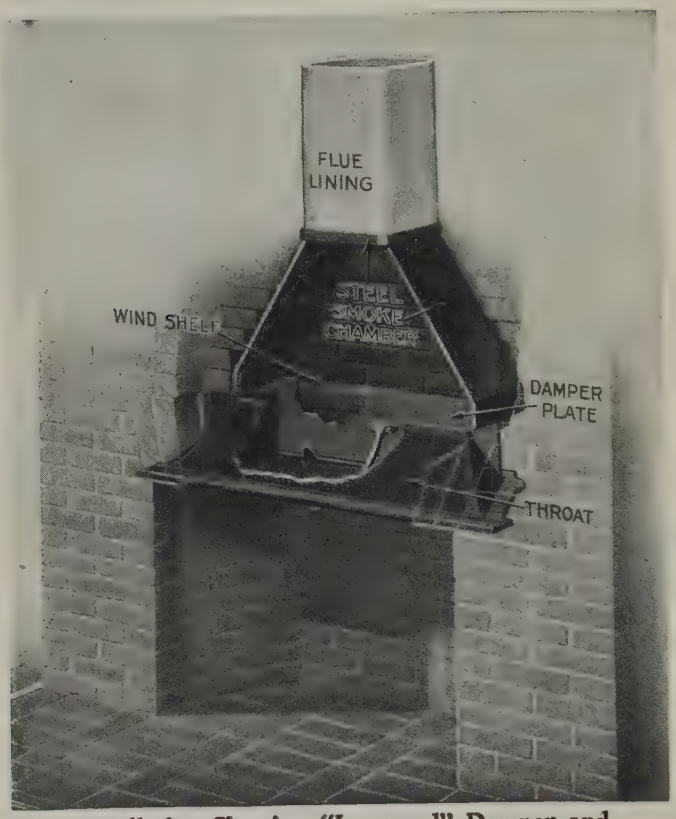
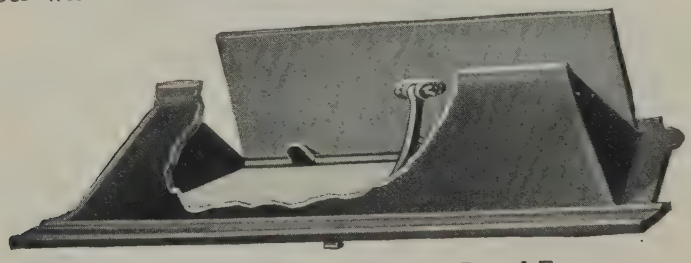
COVERT FIREPLACE DAMPERS
TRADE-MARK



Installation Showing "Improved" Damper and Steel Smoke Chamber

Covert "Improved" Fireplace Damper

This type is very efficient in action due to its curved front and wide, unobstructed smoke opening. Inrushing air follows the curved front up into the smoke chamber with a minimum of resistance.



"Improved" Damper Series D and E

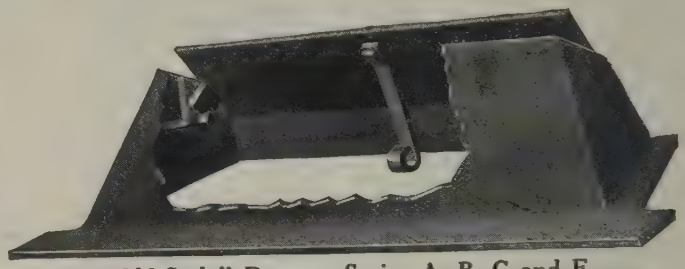
The ratchet handle allows the damper plate to be adjusted to any size opening, from the front of the fireplace. Operating mechanism is very simple and the valve plate is easily removed during construction or for removing accumulations of soot.

Used in fireplaces 20 ins., or less in depth at the hearth.

Covert "Old-Style" Damper

This type is preferred by some architects, especially for use in large and deep fireplaces.

Made in four series, 9, 10, 12 and 16 ins. deep in the base opening, of extra heavy construction, as shown at the bottom of the following page.

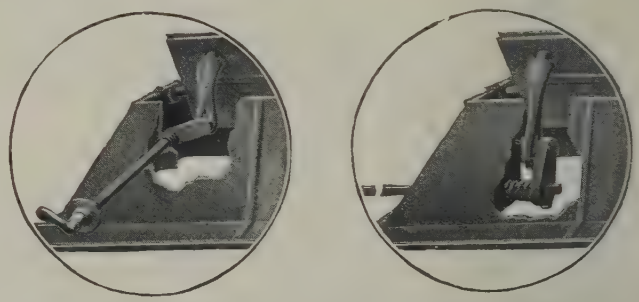


"Old-Style" Damper Series A, B, C and F

Damper plate, operated by a lever reached with a poker, is adjustable to three positions: open, closed and half closed.

Covert Rotary "Face or Side Control" Damper

This type is especially adaptable for use where it is desirable to operate the plate from the face or side of the fireplace by a brass handle.

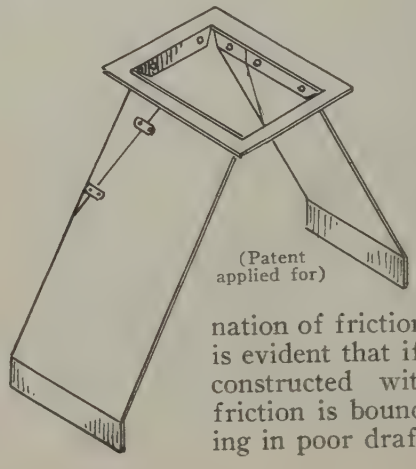


Covert Rotary "Face or Side Control" Damper

Avoiding the usual worm gear (which is likely to become clogged by accumulations of soot), the Covert damper makes use of a simple crank movement that can be connected up to operate from the face or the side of the fireplace with the mechanism accompanying each damper.

Covert Steel Smoke Chamber

To secure the best results a Covert steel smoke chamber should be built above the damper, forming a smooth and properly shaped approach to the flue, thereby reducing friction, increasing the flue power, saving mason's time and insuring proper form of construction.



Since a successful fireplace depends largely upon the elimination of friction to the rising smoke, it is evident that if the smoke chamber is constructed with ragged brickwork, friction is bound to occur, thus resulting in poor draft.

Continued on next page

The Covert steel smoke chamber eliminates this difficulty in fireplace construction.

This smoke chamber consists of two steel plates, a collar the same size as the flue lining, and four bolts for fastening. The mason bolts the two plates to the collar, places this frame over the damper, and builds his brickwork around it. Thus we have a smoke chamber with smooth steel sides which practically eliminates friction. This is impossible in brick facing. Moreover we have a chamber of correct form scientifically designed for ample capacity, and installed in much shorter time than under the old method.

Service

The several types of dampers made by us in many different sizes, covering fireplaces up to seven feet wide, provide the architect, when detailing his fireplaces, with a large choice to meet the many varying conditions encountered in fireplace construction. The following page shows sectional views of each separate type of damper, with their exact dimensions; and the accompanying table gives all further necessary information together with the size of flues recommended in both rectangular and round shape.

We are always pleased to have architects, owners or builders consult with us regarding details of construction of fireplaces and are glad to give them without charge, the benefit of our long experience. Our booklet of fireplace construction will be sent on application.

SEGMENTAL ARCH CONSTRUCTION SHOWING FRONT FLANGE REMOVED

EDWIN JACKSON, INC.

Manufacturers of Jaxon Fireplaces and Building Specialties

50 Beekman Street; also Lexington Avenue and 65th Street

NEW YORK, N. Y.

Products

JAXON DAMPERS, SMOKE CHAMBERS, DUSTLESS ASH TRAPS, BUILT-IN and UNDERGROUND GARBAGE RECEIVERS, WOOD MANTELS, ANDIRONS and FIREPLACE FIXTURES.

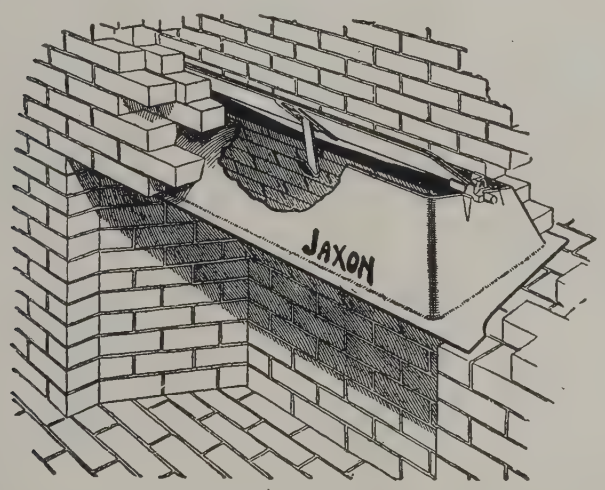
Also manufacturers of Jaxon Sidewalk Chutes, Windo-Shutes, Package Receivers.

For Marble Mantels, Wood Mantels, Iron Linings, Franklin Stoves and Ventilating Grates, see page B1577.

Jaxon Dampers

These dampers are made in three styles, namely, throat, rotary and push. They are designed to insure best possible draft under all conditions.

Our throat type is the latest and best style of fireplace damper. The patent arm holds the door in any desired position. Operation is by poker; no handle shows on the face. Also made in special sizes.



Jaxon Throat Damper

x96x	96	100	100	26	20x24
x120x	120	124	124	28	24x36

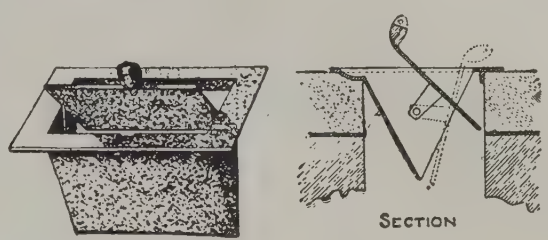
Also made in special sizes.

Jaxon rotary dampers and Jaxon push dampers operate from the front of the fireplace by a rotary rod or push handle. Rotary style can also be had to operate from end of breast.

Jaxon Dustless Ash Traps

For dropping ashes without dust from open fireplaces to the ash pits. In either position, open or closed, there are no openings to permit draft to blow dust into the rooms.

The door is easily operated and there are no springs to get out of order.



Jaxon Dustless Ash Trap

No.	Dimensions, in.		
	Outside flange	Brick opening	Trap opening
9	15 x 9	11½ x 6¼	10⅞ x 5½
6	9 x 7	7¼ x 5¾	6⅝ x 5

Jaxon Built-in Garbage Receivers

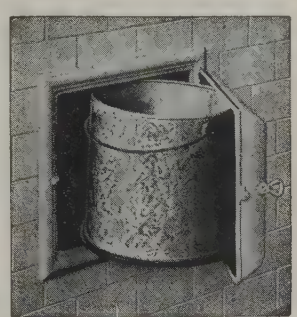
The Jaxon receiver is made of heavy cast iron, including the door and frame. The front of the receiver opens into the kitchen and is so arranged that, when the door is opened, the can is brought forward convenient for use. The door shuts tight and locks securely.

No. 103—Wall opening is 14½ in. wide, 12 in. high and 10 in. deep.

No. 103K, same size and construction, also has an outside door for suburban use.

No. 106—Is similar, and fits a wall opening 19 in. wide, 19 in. high and 10 in. deep.

No. 106K, same size and construction, also has door at back for removal of can through the yard.



No. 3. Garbage Receiver

Wood Mantels

We manufacture wood mantels, copies of good Colonial designs, in stock for prompt shipment. We also make accurately from architect's designs.

For description see page B1577.

Andirons

We import Italian and English andirons, and also make reproductions. We also manufacture other fixtures that will be needed in fireplaces, including grates, fenders, spark screens, etc.

Catalogues

Our catalogues describing in detail all of our products will be gladly sent on request.

THE OHIO FOUNDRY & MFG. CO.

Manufacturers of Dome Dampers and Other Fireplace Accessories

STEUBENVILLE, OHIO

82 Years Manufacturing Fireplace Equipment Exclusively

For eighty-two years we have been manufacturing fireplace equipment exclusively. The products of this company include:

Brilliant Fires	Fire Sets	Dampers
Coal Grates	Gas Logs	Builders' Supplies
Gas Grates	Screens	Electric Logs
Spark Guards	Fenders	Electric Baskets
Portable Baskets	Andirons	Electric Heaters

Bulletins on any of above products or complete catalogue on request.

Ohio 3-in-1 Dome Damper No. 900

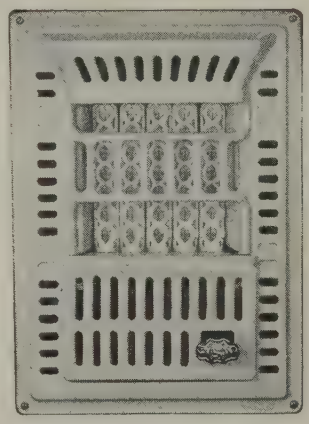
From our long experience with architects and builders, we have learned their wants, and in building our new No. 900 series of dome dampers we have met their demands.

This damper is scientifically correct in construction, complying with all requirements as to measurements of the best known architects in the country.

Damper is shipped equipped for operation either through face of mantle or with underslung lever control. Lid is so arranged that chain pull can be added easily without disturbing the other control and without additional cost.

Ohio Brilliant Bathroom Heaters

A space saver for the bathroom, hall or living room, made in three sizes, vented or unvented. Cast iron front, heavy clay back wall with circulating air chamber thoroughly fireproofed. Equipped with heat-deflecting hood and iron dress guard. Finished in heavy porcelain enamel.



Ohio Brilliant Bathroom Heater

No. 14—5 tubes, outside dimensions 13½x21½ in., fits opening 13½x20½x4 in. Stock finishes, white, blue, green and ivory.

No. 17—7 tubes, outside dimensions 18x22 in., fits opening 16x20½x4 in. Stock finishes, white, gray and mahogany.

No. 18—10 tubes, outside dimensions 22x22 in., fits opening 20x20x4 in. Send for folders.

DETAILS OF DAMPERS, ASH DUMPS & ASH PIT DOORS

PEERLESS MANUFACTURING CO., INC.

Fireplace Dampers and Builders' Specialties

LOUISVILLE, KY.

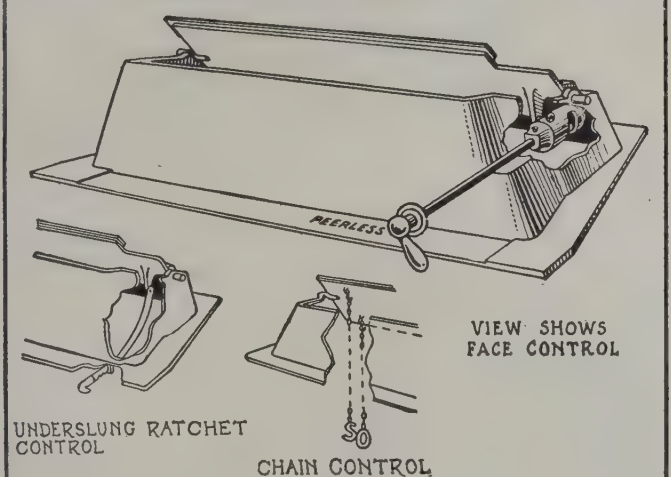
Products

DOME (Fireplace) DAMPERS; COAL WINDOWS; ASH PIT DOORS; ASH TRAPS; IN-THE-GROUND GARBAGE RECEIVERS.

Also Fireplace Furniture (Andirons, Grate Baskets, Screens, Fire Sets, etc.), Gas Ranges, Combination Coal and Gas Ranges, Hot Plates, Radiant Gas Heaters and other Builders' Specialties.

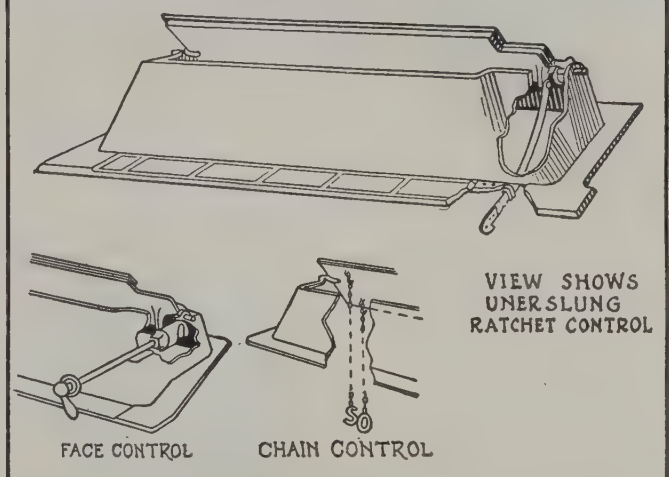
Peerless Fireplace Dome Dampers

This damper is designed to insure a good draft under all atmospheric conditions. It consists of a flanged dome with a door at the top, made from select gray cast iron. The front flange is sufficient strong to support the fireplace arch without the use of angle iron or lintel bar. Made in several different models and all necessary sizes.



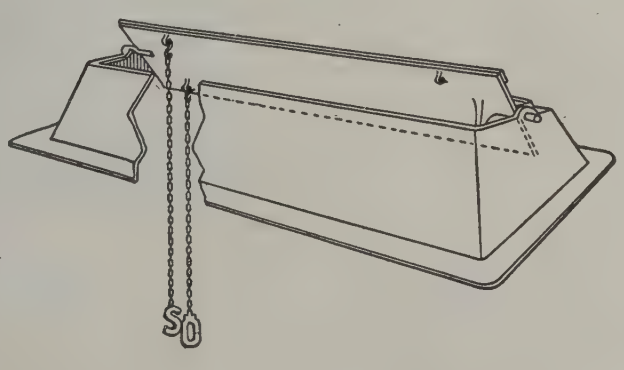
Damper A

Where a heavy weight damper with extra depth is desired this A Damper will meet the need. Can be furnished with any one of the three controls illustrated. *Face Control,* consists of an iron rod with a brass handle and a worm attachment. Operates through the face of the mantel. *Underslung Ratchet Control,* the door is operated by means of an underslung forged steel ratchet lever with a brass handle which operates in an iron loop fastened underneath the right front flange. *Chain Control,* two chains, one to open and one to shut the door



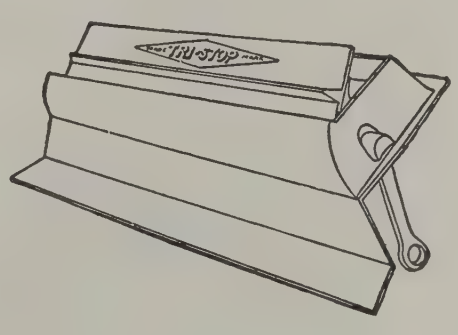
Damper B

A medium weight damper and not quite so deep as Damper A. It has a paneled front flange of extra width thus giving added strength when the front flange is used as an arch bar. Damper B can be furnished with any one of the three controls illustrated: *Face, Underslung Ratchet* or *Chain.* All controls are interchangeable and are simple and effective in operation. No complicated mechanisms to get out of order



Damper C

A light weight damper with one method of control. The door is operated by means of chains, one chain marked with an O opens the door and the other chain marked S shuts the door. Chains may be lengthened or shortened to meet the requirements of the fireplace. This method of control is especially desirable where the damper is placed unusually high in the flue



Tri-stop Damper

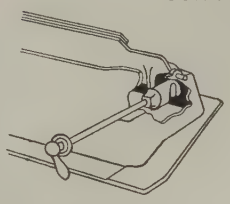
Consists of three parts, dome, lid and handle. No small parts to get out of order. The operating handle has three positive positions, open, partly open and closed. The handle does not project beyond the mantel facing and thus make an unsightly fireplace front. The base of the dome is 3 in. higher than the lintel flange

Continued on next page

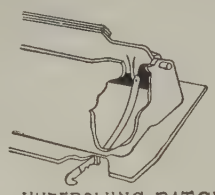
The differences in Dome Dampers A, B and C can be noted by referring to the table of dimensions below

STYLE	METHOD OF CONTROL
A	Face, Underslung Ratchet or Chain
B	Face, Underslung Ratchet or Chain.
C	Chain Control Only.

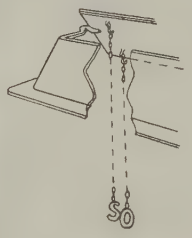
IMPORTANT: Be careful to specify control desired.



FACE CONTROL: Operated by means of a brass handle attached to a shaft extending through the face of the mantel. By means of a worm gear and cam arrangement, a three-quarter turn of the handle completely opens or closes the door.



UNDERSLUNG RATCHET CONTROL: Door is operated by means of an underslung forged steel notched lever with brass handle which operates in a cast iron loop fastened underneath the right front flange.



CHAIN CONTROL: Operated by two pull chains, marked S (shut) O (open). This control is necessary when damper is placed high in the flue

Peerless Coal Windows

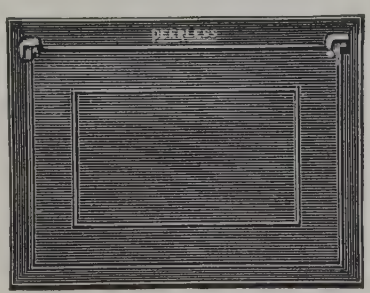
No. 1 Coal Window—Completely automatic. Recommended for the better type of houses, apartments, stores and public buildings.

A gentle pull of the chain, which is usually placed in the kitchen, releases the lock and opens the chute, bringing the door back into the wall and at the same time pushing the hopper forward into place. The chain is then fastened to a peg. When the chain is released, the hopper recedes and the door swings gently into place, at the same time locking securely.

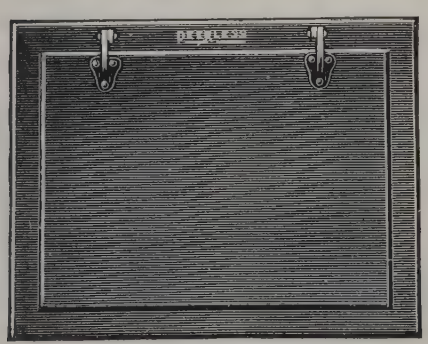
Automatic Coal Window No. 1 with Wire Glass Panel

Cast iron frame and heavy cast iron door fitted with ¼-in. wire glass panel. Heavy gauge boiler plate hopper.

No. 2 Coal Window—Equipped with pull chain control like No. 1 and has a gravity catch. Malleable iron frame and extra heavy boiler plate door. Furnished with or without hopper. Can also be equipped with ¼-in. wire glass door panel.



No. 2 Coal Window



No. 3 Coal Window

No. 3 Coal Window — Malleable iron frame and hinges, heavy boiler plate door. When door is closed it locks automatically. No hopper or chains.

Manufacturers of Fireplace Devices

50 East 42nd Street

NEW YORK, N. Y.

The "Acme" Hearth

This dustless ash dump, operated by a slight pull on a poker, conveniently disposes of the ashes and other debris from either the coal or wood burning fireplace. When the hearth is tipped a curved metal shield automatically seals the opening against dust and sparks.

The framing and body of the hearth are made of cast iron and steel. All movable parts are of malleable iron. There are no springs, oil cups or other parts to require maintenance attention. The total weight is 20 lb. and the hearth is easily handled and installed by one man.

For Home Owner's Information — The "Acme" Hearth has made it possible to have a neat, clean fireplace at all times without the inconvenience usually attendant upon the disposal of ashes and other fireplace debris. No moving of andirons or fireplace baskets is necessary, nor the handling of hot irons—the "Acme" Hearth operates easily, quickly, conveniently.

Typical "Acme" Hearth Installation

Easy to install and keeps the fireplace neat and clean

Specification Data

Supply and install—"Acme" Hearths, as supplied by the W. Fred Sparrow Co., 50 East 42nd Street, New York, N. Y.

Installation—The supporting members of the hearth shall be truly and firmly embedded on the masonry. In pouring the concrete this contractor shall take care that no voids occur under or around the embedded metal.

The finished surface of the trap door of the hearth shall be set level with the surrounding floor area of the fireplace.

This contractor shall make sure that sufficient clearance is allowed between moving parts of the hearth and surrounding masonry. Care shall be exercised to avoid clogging of moving parts with mortar, cement or any other foreign matter that might interfere with operation.

On completion of installation, the hearth shall be solidly bonded to its permanent setting and shall operate freely.

Operation of the "Acme" Hearth

To operate, insert the poker in the receptacle or hole provided, then lift up. This dumps the hearth. Reverse the operation, withdraw the poker, and the hearth is back in its original position clean of all debris.

HEATILATOR COMPANY

MANUFACTURER OF

The Heatilator, a Practical Heating and Ventilating Unit for Fireplaces

MAIN OFFICE AND PLANT

Glen Avenue and Brighton, SYRACUSE, N. Y.

Distributed Through Leading Mason Supply Dealers

Description

Heatilator Fireplace Unit

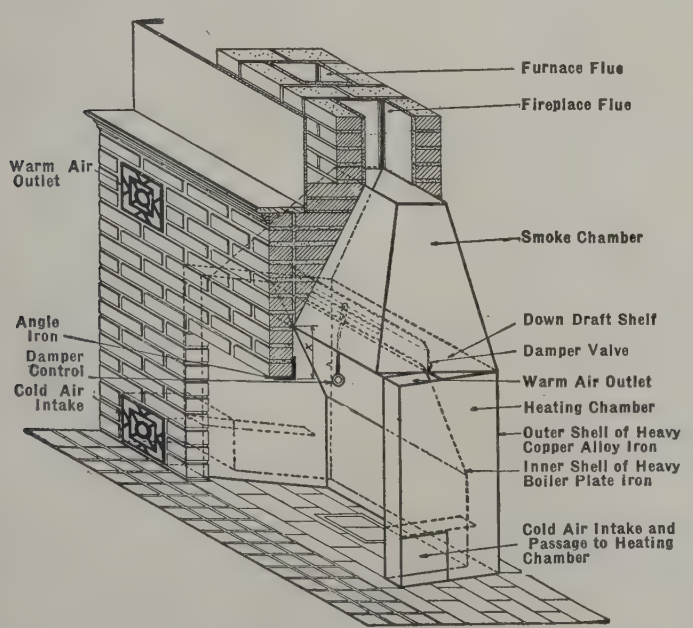
The Heatilator is a metal form around which any mason can build a perfect-operating fireplace that will give double the heat. It absolutely corrects the common faults of fireplace design and construction which cause smoking, cold air drafts, insufficient heat and waste of fuel. Yet the Heatilator does not affect the design of the mantel nor limit the architect in the selection of materials used in the masonry.

A Charming Heatilator-equipped Fireplace

Note grilles for air intakes at floor line with air outlets above the mantel. The grilles can be located anywhere in the sides or front of the fireplace depending upon the design.

Principle of Operation

The basic principle behind the Heatilator is its double wall construction. These walls form an air chamber into which the cold air is drawn through inconspicuous grilles or masonry latticework. This air circulates throughout the air chamber and is discharged again—heated—through other grilles higher up in the masonry. The principle of operation is similar to that of the warm air furnace.



Cross-Section View of Heatilator

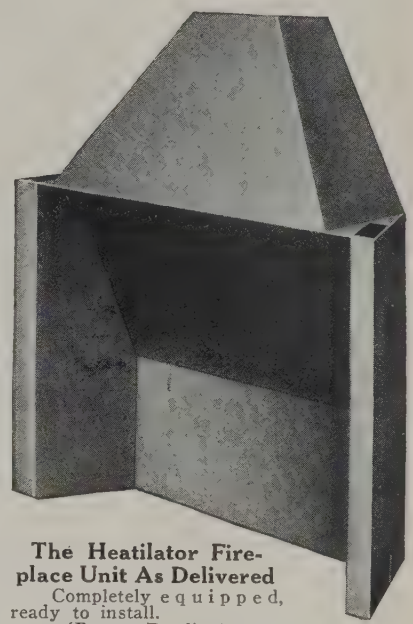
Advantages

(1) Saves one-half its cost in material and labor.

(2) Insures scientifically correct construction.

(3) Makes fireplace more useful by giving twice the heat. Anemometer tests show that the Heatilator-equipped fireplace with a moderate wood fire produces 100 cu. ft. of air per minute at a temperature of 200° to 250° F.

(4) Enhances fireplace beauty through the small decorative grilles for air intakes and outlets.



The Heatilator Fireplace Unit As Delivered

Completely equipped, ready to install.
(Patent Pending)

(5) Increases property value and makes it more readily salable.

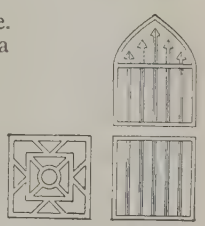
(6) Does not require the services of a highly skilled fireplace specialist.

Grilles—

Grilles for the air intakes and outlets can be had at the following prices, in either of the two designs illustrated:

8-in. Grilles, $1.60 each.
10-in. Grilles, $2.00 each.

Finish is grey iron, japanned and oxidized. Special designs in clay as well as faience. Tile grilles furnished at slight additional cost.



Specifications—

The inner shell forming the firebox is of $\frac{1}{8}$ to $\frac{3}{8}$-in. copperoid boiler plate iron. Downdraft shelf and smoke damper are of the same material. The outside and dome walls which serve as forms for permanent masonry are of 14 gauge copperoid iron. All seams are electrically welded. The damper is easily removed, adjusted to any position—positive poker control requires no mechanism or fixtures in the mantel.

Installation Directions—

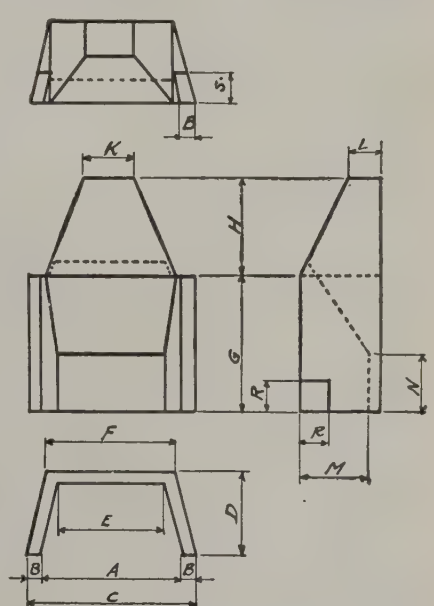
Complete directions for installing, simple and easy to follow, together with a plan drawing, come with each unit.

Shipped for Free Inspection—

Shipment will be made to any reliable dealer or architect for inspection. If not found satisfactory, the Heatilator may be returned and freight charges will be refunded.

Freight Allowed—

Freight is allowed to all rail points east of the Rocky Mountains. Denver rate is allowed to all points west.



See table below for key to these drawings, also for prices

Great Britain, France and Belgium
FREDK. BRABY & CO., Ltd.,
Petershill Road, Glasgow, Scotland

Products

BOIS PATENTED INTERLOCKING SHEET STEEL TREADS and RISERS.

Also manufacturers of Sheet Steel Stairs.

Advantages

Bois interlocking tread and riser offers distinct advantages of economy, rigidity and rapid erection. The *interlocking* feature eliminates the labor of bolting or riveting, and makes rapid installation possible with unskilled labor.

Heretofore the nosing on sheet metal stairs broke away from the composition steps. Bois interlocking tread and riser prevents breaking away the nosing from the composition step under the heaviest traffic. Its superiority and economy in construction can be readily seen.

Interlocking Feature

The interlocking tread and riser combined is formed from a single sheet of steel with flanged member that interlocks at the nosing line. The metal becomes double thick which reinforces the steps.

Labor Saving Installation

A tie rod is inserted under each tread through the stringer. The installation consists only of setting the tread, bolting up the tie rod and inserting two bolts for each tread where the tread meets the flange of stringer, doing away with the bolting or riveting as in ordinary types of stair work, and speeding up the erection.

Varied Standards

The gauge of metal varies with the width of the stairs and weight to be carried. The interlocking treads and risers can be used with any type of stringer such as sheet steel construction or concrete.

The treads are adaptable to any kind of composition fill, slate, marble, asphalt or concrete, also for any desired safety tread.

Deliveries

When sheet steel stringers are used, the stairs can be assembled at the factory and delivered at the building ready for installation. Each section can be installed as the building progresses, eliminating the use of temporary stairs or ladders, doing away with unnecessary expenses.

If concrete stringers are to be used, the treads and risers are interlocked and put in position from floor to floor, after which the stringers are moulded as usual.

Inquiries

Make all inquiries for estimates to the Manufacturer (list in heading) controlling the territory in which the building is to be erected. State number of treads and risers, width of stairs, type of stringers, and nature of tread. Include sketch or drawing on which all dimensions and quantities are indicated.

Specifications

All metal stairs throughout the building shall be of the Bois Interlocking Tread and Riser construction type.

Each tread and riser shall be of one continuous piece of No. 12 or No. 14 gauge sheet steel. The tread metal shall be continued up and bent into an inner nosing, around which the outer (wearing) nosing shall be bent and secured by an interlocking, depending flange, reinforcing the step and preventing the nosing from breaking away from the concrete.

The junction of the treads and risers shall be securely fastened to the lower flange of the stringers with $\frac{5}{16}$-in. diameter round machine bolts.

The face and wall stringers shall be of No. 10 gauge sheet steel, with outward top flange and inward bottom flange. Stringers shall be securely tied together with $\frac{7}{8}$-in. diameter tie rods, placed under each tread, near the nosing.

Platforms or landings shall be of No. 14 gauge corrugated steel plates, with interlocking nosing for connection with riser and shall be securely fastened to angle iron supports connected to stringers.

Newels, railings and balustrades to be of design and construction as indicated on plans.

All work to have 1 shop coat of approved paint.

Information and Catalogue

For full information and illustrated catalogues and detail drawings apply to Manufacturer (list in heading) controlling the territory in which the stairs are to be installed.

Continued on next page

Feature of the Bois Patent Interlocking Treads and Risers for Stair Construction;

It eliminates all bolting and riveting thus saving considerable labor when assembling the stairs. Where the tread interlocks at the nosing the metal becomes double thick, reinforcing the step and preventing the metal breaking away from the concrete.

It is the most practical, economical, superior stair construction.

TYPICAL SECTIONS SHOWING CONSTRUCTION OF BOIS PATENTED INTERLOCKING TREADS AND RISERS

Test of Bois Patent Interlocking Sheet Steel Stair Made by E. Van Noorden Co., Boston, Mass.

December 9, 1924

In order to determine accurately the safe loading for the Bois Interlocking Sheet Steel stair, a test was conducted by Professor H. W. Hayward of the Massachusetts Institute of Technology, Cambridge, Mass. A summary of this test is as follows:

"The full load of 600 pounds per square foot was allowed to remain upon the stairs for two weeks. The load was then removed and after four days the inspection was made.

"The slight distortion in channel header (at top) straightened out when the load was removed. The deflection in the top flange of runner was reduced to a negligible amount upon removal of the load. The general appearance of the stairs was good. No indications of overstrain could be noted either as regards lateral or vertical deflections.

"It should be noted that during the time the load was on the stairs the temperature varied approximately from 0° to 50° F. This variation in temperature would cause additional indeterminate stresses on the stairs."

Full report of test will be sent on request.

BABCOCK-DAVIS CORPORATION

Manufacturers of Pre-cast Concrete Stairs with Steel Stringers

474 Dorchester Avenue

BOSTON, MASS.

Products and Services

BABCOCK-DAVIS PRE-CAST CONCRETE STAIRS WITH STEEL STRINGERS. (Patented.)

Also manufacturers of Ornamental Iron Work: including Cast and Wrought Iron Stairs; Railings, Marquises; Wire Grilles; Elevator Fronts, Frames and Thresholds.

Our engineers invite consultation during preparation of plans and will gladly co-operate in making working drawings and computing proper sizes required. Estimates submitted on request.

For Steel Flagpoles, see pages A676-677.

Pre-cast Concrete Tread and Riser

Strength (Factor of Safety, 10)—At the Massachusetts Institute of Technology tests were made by Professor Irving H. Cowdrey on 4 units. Each unit consisted of a pre-cast concrete tread, 4 ft. long by 11¼ in. wide, and 8-in. riser mounted on steel channel iron stringers. The average of these tests shows:

First hair crack in riser at 2300 lb. total load. Maximum load 3575 lb.

Construction—"Pre-cast concrete tread and riser" construction is economical to install and maintain, and is made from a scientifically prepared formula which makes the stair as hard as stone and practically indestructible. The Babcock-Davis "Pre-cast Tread and Riser" stair marks a decided advancement in stair construction for either inside or outside installation. As the name suggests, it is a combined reinforced concrete tread with steel nosing and riser cast in one interlocking unit. This work is done in our own shop and the units are shipped to the building under construction, where they are applied to the steel stringers furnished by us.

Advantages

Its very practical principle of interlocking, replaceable units has many advantages:

It is of lighter construction, is installed more quickly, at a smaller cost than stairs made entirely of concrete, has a steel nosing and *stringer buttress* as required by insurance engineers.

Wood forms, and such obstructions which delay building operations while the cement is hardening in all-concrete stair construction, are done away with.

There is no ringing sound or vibration to Babcock-Davis "Pre-cast Concrete Stairs" when in use, for they are practically noiseless. They are attractive in appearance. All joints are tight. Their upkeep is reduced to a minimum, as steps need not be painted, and, being dustless, they are easily kept clean.

Babcock-Davis "Pre-cast Concrete Treads and Risers" treated with our Non-slipping Formula and with our steel nosing cast into the tread is a fine safety tread, with no opportunity to chip the nosing.

Specifications

In writing specification, state: "BABCOCK-DAVIS CORPORATION, 474 Dorchester Avenue, Boston, Mass., Patentee, will furnish steel stringers, railing and 'Pre-Cast Concrete Treads and Risers' with steel nosing complete."

For schools, hospitals and public buildings, where non-slipping qualities are desired, specify "To be treaded with BABCOCK-DAVIS CORPORATION Non-slipping Formula."

Installations

We have installed our pre-cast concrete stairs in a great many buildings in the United States and in every case they have received the highest praise and approval of every engineer and architect who has investigated them including the Building Department of the City of Boston.

Pre-cast Concrete Stair with Steel Nosing

BUILDERS' IRON WORKS, INC.

Steel Stair Specialists

TELEPHONE
DAYTON 4123-4124

615-617 Tiffany Street

NEW YORK, N. Y.

Product

PRESSED STEEL STAIRS: Ornamental, Plain and Commercial.

Stairway Specialists

We manufacture steel stairways exclusively. Our specialization assures unusual service and low prices. We produce a saving in the cost of manufacture because we have the most modern machinery, dies and labor saving devices. We complete stairs quickly and on schedule time, as we employ only specially trained workmen who are accustomed to our systematized methods. The keynote of our organization is *Stairway Service* to the architect, builder, engineer and contractor.

Erection

We are prepared to erect our stairways anywhere under any weather conditions, rapidly, and at a considerable saving in construction costs.

Construction

Our stairways are constructed in accordance with the best shop practice. We endeavor to maintain the highest standard of quality at all times. Our stairways meet the requirements of the State and city codes. They are attractive and cost less than similar stairways. Our standard stairways can be readily modified to meet the requirements of the architect. Workmanship and materials are guaranteed against defects.

Welding and Riveting—Both welding and riveting are employed as required, and according to the best shop practice.

Treads and Risers—Multiple sections of No. 14, 12 and 10 gauge blue annealed steel are used. A tread and riser are one unit supported by and bolted to angle iron carriers which are machine riveted to stringers.

Stringers—We make three types: plate and angle, pressed steel channel, structural channel.

The first two types are made of universal mill steel plate, especially rolled for stair work. The other type is the standard structural channel.

Newels—Plain or ornamental to suit design in cast iron, pressed steel tubing or square wrought iron tubing. Caps and drops can be had in ornamental cast iron.

Facias—Made of steel plates and paneled with steel moulding where required.

Railings—Wrought or cast iron according to architect's details.

Platforms—Crimp sheet iron platforms to eliminate cross tees or angles, or plain sheet iron over structural steel tees and angles.

Painting—All work is given one coat of rust preventive paint before leaving shop. No painting done in field.

Standard Construction Details

Standard stringer, treads and risers, railings and newels drawn to large scale furnished upon application.

Stairs to Architect's Design

We can furnish steel stairs of any design to meet any requirement.

Information and Estimates

We will be pleased to furnish information regarding construction and typical installations and estimates.

Steel Stairs Exclusively

MAIN OFFICE AND FACTORY

Leggett Avenue and Truxton Street

NEW YORK, N. Y.

SALES OFFICES IN PRINCIPAL CITIES

Product

Manufacturers of STEEL STAIRS, exclusively and all parts for steel stairs, including Newel Posts, Risers, Stringers, Facias and Railing.

Steel Stairs Exclusively Since 1902

In 1902 we built the first flight of pressed steel stairs ever made, our firm being organized in that year for the purpose of manufacturing *steel stairs exclusively*. In spite of the fact that for some years we were the sole manufacturers of this product, within five years steel stairs had replaced cast iron in practically all new buildings in Greater New York. Soon thereafter steel stairs were in general use throughout the country. In the last twenty-six years we have built not less than 200,000 flights of stairs.

Construction—Our stairs are built to architects' specifications. They are built as a steel structure is built, with rivets, bolts, and strong welds, in accordance with sound engineering practice. Our patents are not for unique methods of assembling stairs, but for the basic machinery and methods of building strong stairs cheaply.

Tests—In 1908 Prof. Ira Woolson of Columbia University tested our stairs and found that they will bear a live load of 400 lb. per sq. ft. with no permanent deflection. Our stairs are approved by the Building Department of the City of New York and have been erected with the approval of the local authorities in practically all communities throughout the United States.

Suggested Specifications for Architect's Use

General—Stairs shall be of steel made by SUCCESSORS TO GROSSMAN BROS. & ROSENBAUM, INC. or of equal construction and in accordance with the following specifications:

Stringers—

Note: When writing a specification use only the paragraphs covering the type of stringers desired.

(1) Wall stringers shall be Type No. W-1 made of 12x$\frac{3}{16}$-in. plate rolled into the form of a channel 10x$\frac{3}{16}$ in.

(2) Wall stringers shall be Type No. W-5 made of 10x¼-in. plate with 1¼x1¼x⅛-in. angles riveted top and bottom to form a channel.

(3) Face stringers shall be Type No. F-1 made of 12x$\frac{3}{16}$-in. plate rolled into the form of a channel 10x$\frac{3}{16}$ in.

(4) Face stringers shall be Type No. F-5 made of 10x¼-in. plate with 1¼x1¼x⅛-in. angles riveted top and bottom to form a channel.

(5) Face stringers shall be Type No. F-2 made of 12x$\frac{3}{16}$-in. plate with an integral moulding rolled into top and bottom.

(6) Face stringers shall be Type No. F-3 made of a 12x$\frac{3}{16}$-plate rolled into the form of a channel 10x$\frac{3}{16}$ in. with our rolled stock steel moulding applied top and bottom.

(7) Face stringers shall be Type No. F-4 made of a 10x¼-in. plate with Braun [Blum] moulding top and bottom.

(8) Face tringers shall be Type No. F-3A made of a 12x$\frac{3}{16}$-in. plate rolled into the form of a channel 10x$\frac{3}{16}$ in. with Braun [Blum] moulding applied top and bottom and a rolled moulding applied to form a center panel.

(9) Face stringers shall be Type No. 4A, same as Type No. 4, with a rolled moulding applied to form a center panel.

Carriers—Carriers shall be 1¼x1¼x⅛-in. angles securely riveted to stringers by 3$\frac{3}{16}$-in. round head rivets.

Newels—Starting newel at first floor shall be Type GN (substitute type number desired); other newels shall be Type CN (substitute type number desired).

Railings—The balusters shall be Design A made of ⅝-in. square bars 5 in. on centers with a channel 1x⅜ in. top and bottom, the top channel shall be drilled to receive a wood handrail furnished and installed by others. (Substitute design desired and if pipe handrail is required.)

Risers and Treads—Risers and treads to be Style No. 5 in one continuous piece of blue annealed steel sheet. The riser is to be panelled as indicated. The subtreads are to have nosings for cement fill 1½ in. thick. (Substitute style desired and if for marble, slate, terrazzo, etc.)

GUARSTEEL SAFETY STAIR COMPANY

Manufacturers of Safety Steel Stairs

165 West Wacker Drive

CHICAGO, ILL.

Products

GUARSTEEL STAIRS, REVERSIBLE NOSINGS, BENT STRINGERS, TREADS, RISERS, LIGHT WEIGHT CIRCULAR STAIRS, GUARSTEEL THRESHOLDS and STAIR NOSINGS.

Guarsteel Stairs

The very fact that we manufacture a distinctive one-piece tread and riser equipped with a safety nosing accounts for the fact that Guarsteel Safety Stairs are rapidly becoming known.

The illustration shown below depicts the safety feature of our stairway clearly and concisely and, without stretching the imagination, you can conceive the raised buttons with a perforated hole therein. These raised buttons, spaced 5/8 in. on centers, form a superior safety grip and render long and efficient service.

Architects being selected for their superior knowledge of building materials of all descriptions should protect the owner in every possible manner against accidents. Therefore, why not specify Guarsteel Safety Stairs and receive this protection, also a first class installation in every particular.

Reversible Nosings

The latest development of our Engineering Department covers two new features:

(1) A reversible safety nosing which can be kept in service until the upper surface does not provide a safety grip any longer; then the tap screws can be removed, the nosing reversed, and, in this way, a new safety wearing surface placed above the tread.

(2) The same principle adapted to a plain stair without a safety feature; permitting replacements, when the metal wears through nosing, without removing treads and risers, as is necessary with standard one-piece treads and risers.

These new features are fully covered in the illustrations on the next two pages, and are entitled to your very careful consideration.

Circular Stairs

Guarsteel Spiral Stairs are made entirely of steel, light in construction, but possessing greater strength than any other type on the market.

We do not depend upon any clamp connections to the center pipe column, such as were used in the past, and are never asked to come back to a job to tighten the various parts. We can point with pride to all of our late installations and the efficient service which we render.

We have no patterns to make, no castings to make, and provide a stair at least 40% lighter than the average cast iron stair.

Thresholds

Guarsteel Thresholds are less than half the weight of cast iron and can be made in any required length. The same safety feature is applied to the surface of these thresholds that is used on our stairs.

Catalogue

Write for our Catalogue No. 3, bearing out all of our statements.

We are very glad to co-operate with architects in designing stair structures and will render any assistance that is asked.

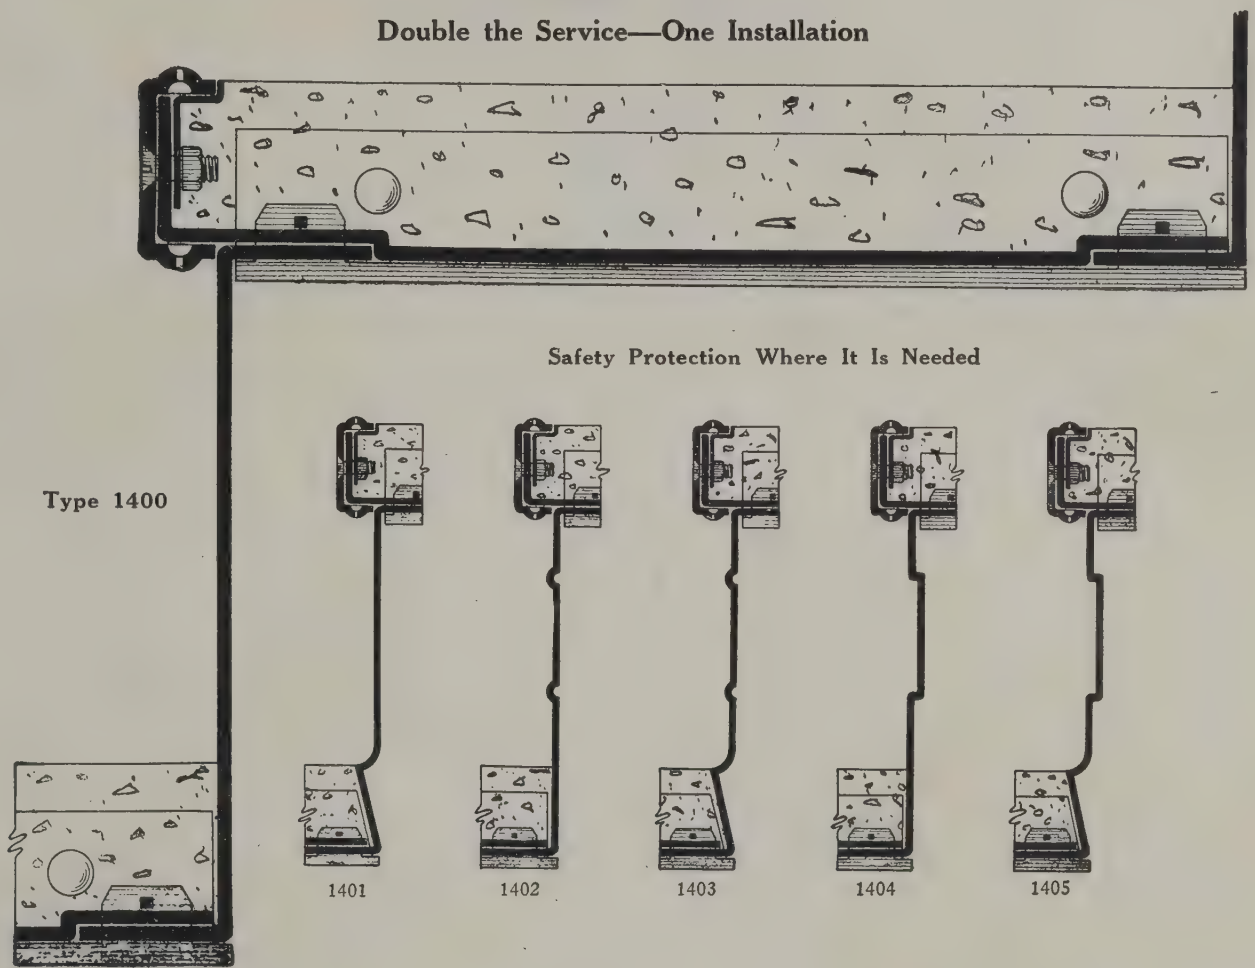
REVERSIBLE NOSINGS

Double the Service—One Installation

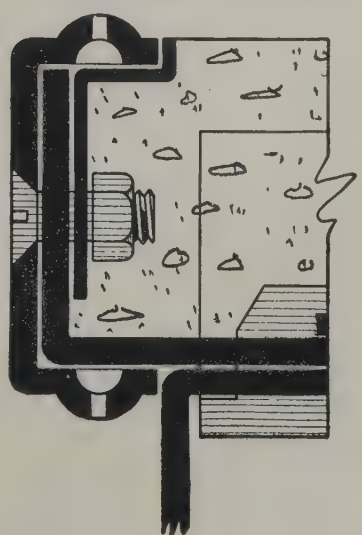


Safety Protection Where It Is Needed

Type 1400

1401 1402 1403 1404 1405

Actual Size of Nosing



The slippery portion of a stairway is at the nosing. That is one reason why we advocate a small nosing with a good safety grip. The back portion of the tread being of cement or composition filling, is liable to wear hollow back of the nosing and, unless the entire tread surface is built of safety material, it will be necessary to patch the tread surface; but, why go to an expense of providing a full safety surface when the expense of patching the cement or fill can be done at a very low cost.

We suggest the use of Guarsteel Reversible Nosings which can be taken off, turned upside down, and provide as many years of additional protection as the original upper surface provided.

The reversible nosings are also made for use in connection with reinforced concrete stairs, either in the form of tread nosings or as a complete riser with safety nosing.

In all cases the inside pan provides against the breaking away of concrete at any time the nosing is removed or replaced and is a feature of our construction.

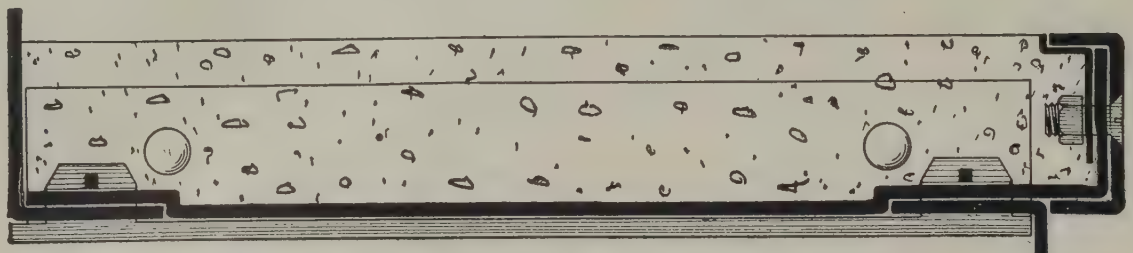
Guarsteel Safety Stair Company

165 WEST WACKER DRIVE. CHICAGO. ILL.

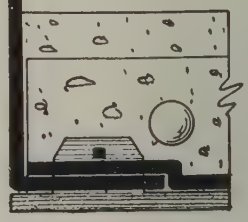
REVERSIBLE NOSINGS

The Latest Achievement in Plain Stairs

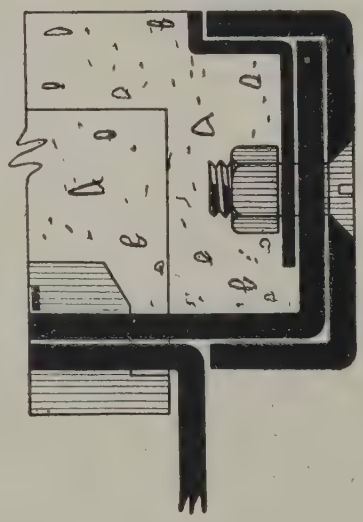


With This Added Feature Our Stairs Become a Perpetual Installation

Type 1500



Actual Size of Nosing



Take a look at any installation of standard steel stairs. The point that begins to show wear is the steel nosing, and it is a question, depending upon the amount of traffic the stair receives, of how soon the metal will wear through at the outside edge. This is bound to happen, and the only salvation that architects and owners have is to place a safety tread over this portion of the stair. The placing of this safety nosing is above the finished line of the tread and generally lasts but a very short time, when it will have to be replaced.

Modern architects with far sighted ideas are taking kindly to reversible Guarsteel nosings, shown on this page, which doubles the life of the nosing at the outside point, and in years to come, when both surfaces of the nosing have been worn through, it is only necessary to buy these small nosings and place them on the stairs.

We claim that the reversible nosing feature makes our stairs a perpetual installation, and there is no way of doubting this assertion because of the easy manner in which replacements can be made at the only wearing point.

Our literature covering the complete usage of these nosings is ready for distribution and we feel that architects and builders will welcome the opportunity of receiving this information.

Description of J & L Light Weight Channels

J & L Light Weight Channels are produced on modern rolling mills and are similar in type to standard channel sections. They have constant dimensions, making fabricating and fitting to other work economical.

Due to the rolled shape, the material is ready, as received, for fabrication into various uses, including stair stringers, thereby saving time. The rolled shape also reduces to the minimum shop equipment for fabrication. J & L Light Weight Channels are economical in weight and form a strong structure.

The lines are straight and true, resulting in proper fitting at the joints, thus making a well-finished installation.

These sections are available at the present time in two weights—8 lb. per ft. and 8.8 lb. per ft.

A cut showing typical installation, as well as tables giving dimensions, allowable loads on both 16,000 and 18,000 lb. per sq. in. stress and other properties are shown below.

The new light weight channels are available for immediate shipment from the following points: Chicago, Cincinnati and Pittsburgh. Carried in lengths of 20, 25, 30 and 40 ft. Other lengths by special arrangement.

Note: Loads above lines at left will produce maximum allowable shear in webs; loads above lines at right will produce excessive deflections.

THE HUGHES-KEENAN CO.

Pressed Steel Stairs and Spiral Steel Stairs

MANSFIELD, OHIO

Products

SAFETY-LOCK and SAFETY-NOSE INSERT PRESSED STEEL STAIRS; SPIRAL STEEL STAIRS.

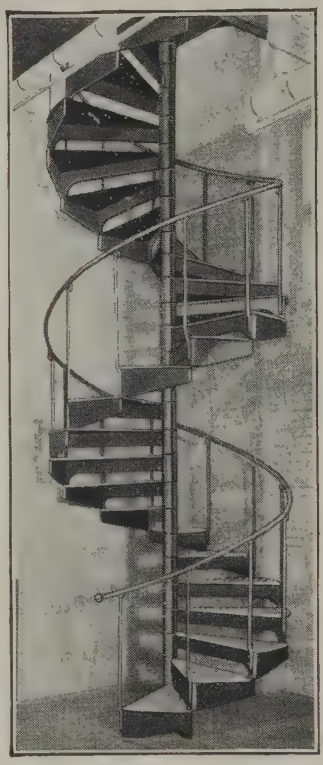
General

Both types of pressed steel stairs and the spiral steel stairs are the result of many years of practical experience in the design, manufacture and installation of steel stairs for all types of buildings and for all purposes. They combine great strength with minimum weight and can be easily adapted to any requirements of the architect or builder and made plain or highly ornamental as desired. They meet the requirements of all State and city building codes.

All special features such as our safety-lock tread and riser, safety-nose insert and spiral stairs are covered by patents allowed and applied for.

Safety-Lock Pressed Steel Stairs

Made with a continuous steel plate tread and riser firmly interlocked at nosing, each tread bolted rigidly to the lower flange of a Z-shaped stringer and all tied together with a tie rod running under the angle of each nosing from stringer to stringer. With channel shaped stringers light steel carriage angles are used with tread bolted to carriage angle. See following page for construction details.



Hughes-Keenan Spiral Stairs in Horace Mann Junior High School, Cleveland, Ohio

Safety-Nose Insert Pressed Steel Stairs

These eliminate exposed sheet metal on treads, providing a safety tread as a part of the stair at a cost considerably below that of special safety treads. Tread and riser is a continuous steel plate formed at nosing into a channel or trough section in which a lead insert is firmly bolted, providing a lead safety nosing in edge of the tread where most needed. This insert is easily and quickly installed. Can be renewed when worn at very low cost and does not affect the tread filler when replacing. Cement, composition or asphalt filler can be used. Tie rods with Z-shaped stringers or carriage angles with channel shaped stringers may be used. See following page for construction details.

Write for our special folder describing these stairs.

Spiral Steel Stairs

The extreme lightness and simplicity of design of the spiral stairs makes one-man erection practical. The lightness comes through a special construction of steel which is decidedly lighter than old-style cast iron yet carries an equal live load.

These stairs are furnished with checkered steel plate treads and plain steel plate risers of open or closed type. They are fastened to steel sleeves which slip over the central supporting column. An erection simplicity that means a decided saving of time and labor.

The finished assembly is decidedly compact and appealingly neat. Complete details are given in a special folder sent on request.

Pre-built Erection Method

The Hughes-Keenan Pre-built Erection Method reduces the cost of the stairs installed in building 25% below usual cost. There is no reduction in quality of stairs—the saving resulting only from low engineering and erection costs and shop standardization. Stairs are on the job to be installed as building progresses, giving contractor use of them instead of requiring erection of temporary ladders or stairs. Cutting and fitting and patching of plaster is avoided.

Write for our special folder describing this method.

Installation

Stairs, except spiral steel stairs, are shipped in completely assembled units so that they can be easily and quickly installed at low cost.

Experienced erectors furnished when desired.

Typical Installation of Hughes-Keenan Safety-Nose Insert Pressed Steel Stairs

Standard Construction Details

Standard stringer, tread and riser, railing and newel details, drawn to large scale, furnished to architects upon application.

Stairs to Architects' Designs

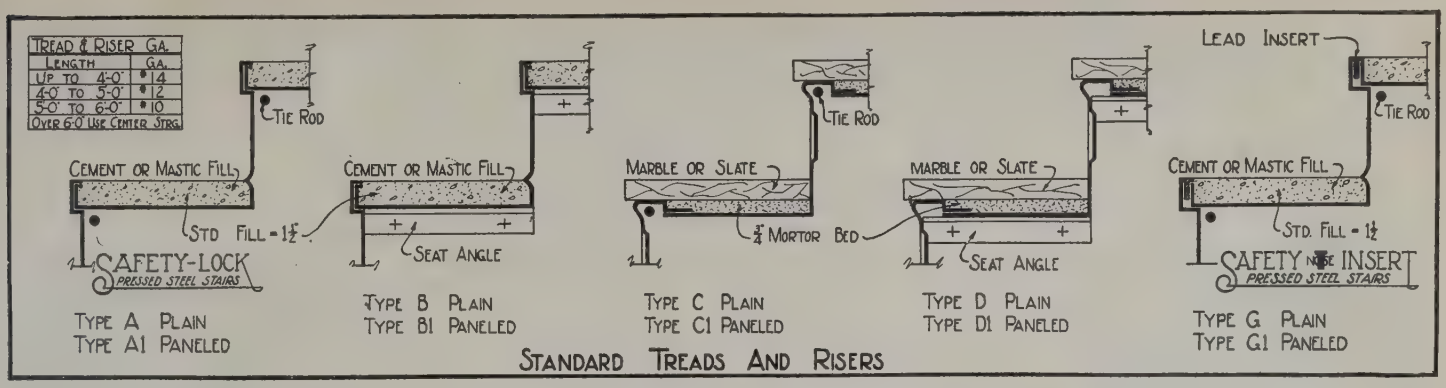
In addition to our patented pressed steel stairs, we can furnish steel stairs of any design and to meet all architects' requirements. We can also furnish the Bois Interlocking Steel Stairs in the states of Maryland, Delaware, District of Columbia, Colorado, Wyoming, Utah.

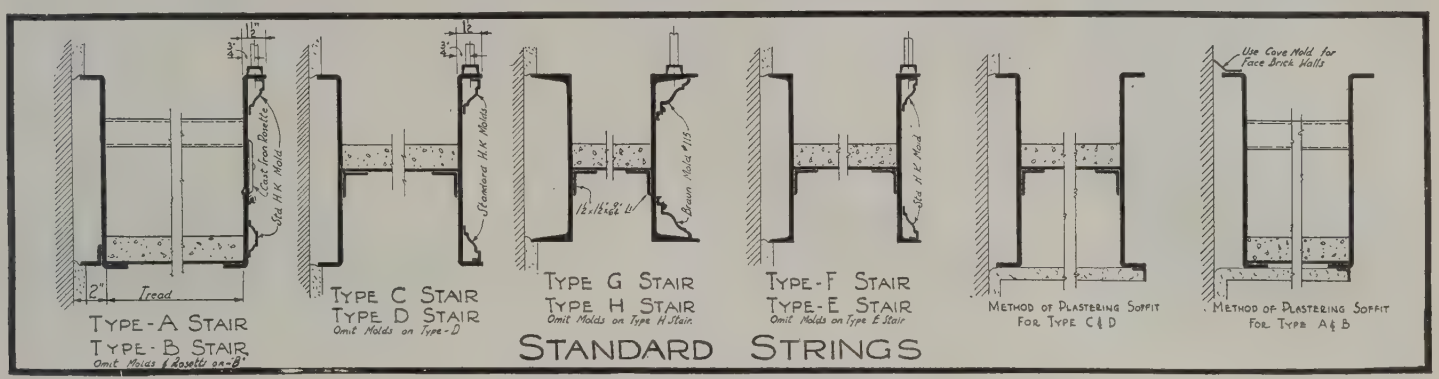
Information and Estimates

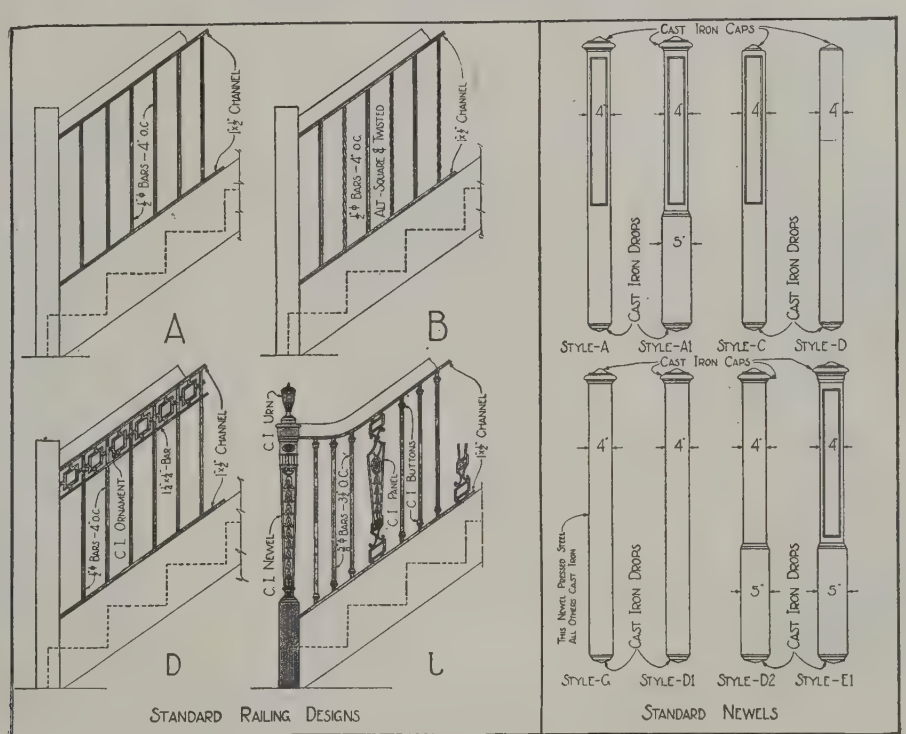
For catalogue, complete information regarding construction and typical installations and estimates, write THE HUGHES-KEENAN CO., Mansfield, Ohio.

Typical Installation of Hughes-Keenan Safety-Lock Pressed Steel Stairs

Continued on next page







Construction Details

Treads and Risers—Illustrated above are standard Safety-Lock and Safety-Nose insert treads and risers. Treads are made to receive cement, composition or asphalt filler. Risers are made either plain or with sunken panel and have sanitary cove.

Standard tread and riser for slate or marble treads are also shown with risers plain or paneled and sanitary cove omitted. The tread and riser is continuous and the gauge of metal used is determined by the width of the stair.

Stringers—Sections of various types of standard stringers are illustrated above. Z-shaped, pressed steel stringers are used for both Safety-Lock and Safety-Nose insert stairs when tie rods are used. Pressed steel or light structural channels are used with carriage angle construction.

The gauge of plate and depth of stringer or size of structural channels is determined by span and width of stair, using a high factor of safety.

Newels and Railings—Newels and railings are furnished to any design to suit architects' requirements. A few standard railing designs are illustrated above. Pipe railings or railings of any other design can be furnished.

The cast iron and pressed steel newels shown are stock designs with square shaft and base. Newels of any design can be furnished. Pressed steel newels are either 3 or 4 in. square, have perfectly smooth surfaces and are very rigid and strong.

MESKER BROTHERS IRON COMPANY

Combination Steel and Concrete Stairs

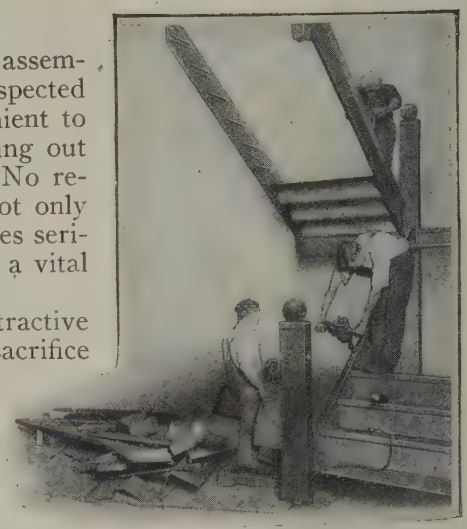
ST. LOUIS, MO.

For Steel Sash and Metal Windows, see pages A1276-1278

Note This Comparison—Erection

Mesker's Stairways come to you completely assembled at factory, carefully painted, checked and inspected prior to being shipped in sections most convenient to handle, and to facilitate installation. No sorting out and assembling various and numerous parts. No refitting, repunching or reboring, all of which not only adds substantially to the cost, but likewise causes serious delay in erection of same, as well as being a vital factor in marring the appearance thereof.

In some instances a seemingly more attractive price may be offered by others, but do not sacrifice absolute satisfaction in every respect, as the effects of poor quality and a higher erection cost will in no instance offset the possible difference in the original price.



Specifications

Stringers—Shall be $\frac{3}{16}$-in. steel plate, bent in channel form and of width shown on plans.

Treads and Risers—Shall be made of one continuous steel plate No. 12 or 13 gauge, bent to form as indicated. Treads shall be supported at ends by special clamps, securely bolted to stringers with acorn heads on face strings and shall be filled with concrete or other material by others. (Tread filling $1\frac{1}{2}$ in. more or less in thickness.)

Platforms and Landings—Where required, shall be No. 12 or 13 gauge steel plates, with nosings same as treads and supported on a 2x2x$\frac{3}{16}$-in. angle frame, riveted or bolted to stringers, and reinforced with tees not over 2 ft. on centers.

Newels—Shall be No. 12 gauge blue annealed steel with cast iron caps and pendants.

Railings—To be design indicated on drawings. All to have a shop coat of paint.

Manufacturers of Bois Patented Steel Stairs

1514-1526 West 25th Street
CLEVELAND, OHIO

Products

Bois Interlocking Pressed Steel Stairs.
For Hollow Metal Doors, see page A983.

Service

A modern plant with complete equipment and an efficient organization qualified to give service. We have a thoroughly efficient estimating and draughting department and are glad to assist in construction details. Typical stair details, estimates and suggestions submitted upon request.

Description

The simple interlocking feature of the tread and riser in this stair, offers distinctive advantages in economy, rigidity, strength and rapid erection. It is also easily adapted to any desired tread material. The treads and risers are formed from one single sheet of steel with flanges that interlock at the nosing line, producing a reinforced edge that is always straight horizontally. This feature of double strength material prevents the nosing breaking away from tread filler. The stringers are tied together with a tie rod running under the angle of each nosing from stringer to stringer. The gauge of metal used is governed by the width of stair and weight to be carried. The entire construction makes for a very strong and rigid stair and the light gauge steel is not used to reduce cost with a proportionate reduction in strength. Tests of a standard Bois stair have been successfully made carrying a dead weight of 600 lb. per square foot.

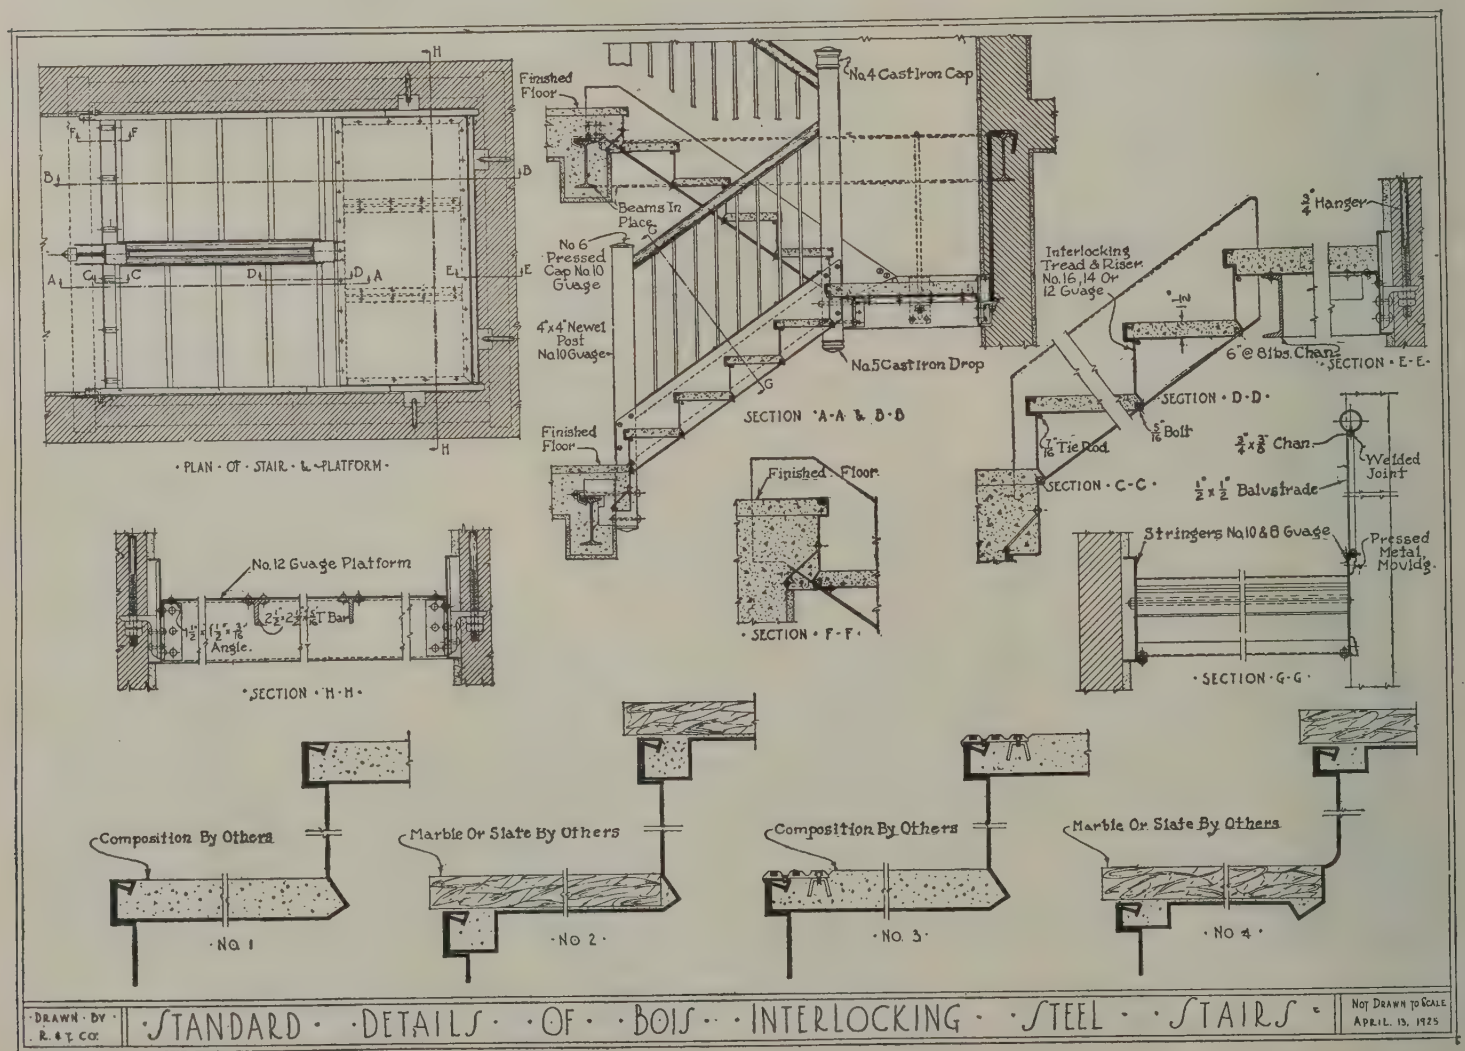
Design

This stair meets the requirements of all state and city building codes and while very simple in design is attractive in appearance and can be readily adapted to the requirements of the architect or builder. Construction may be modified or embellished by ornamenting newel posts, ends of tie rods and stringers, or using cast iron newel posts.

Installation

The interlocking feature dispenses with all riveting and makes for rapid assembling. Each flight of stairs is assembled in a complete unit in the factory and is, therefore, economically erected at the building. This also permits of the stairs being erected with the frame work of the building, giving immediate service before the installation of tread fillers.

For reference we will be glad to furnish names of architects who have specified this product or typical installations which we have made.



TITCHENER IRON WORKS, INC.

Structural, Architectural and Ornamental Iron Work

25 Griswold Street
BINGHAMTON, N. Y.

Products

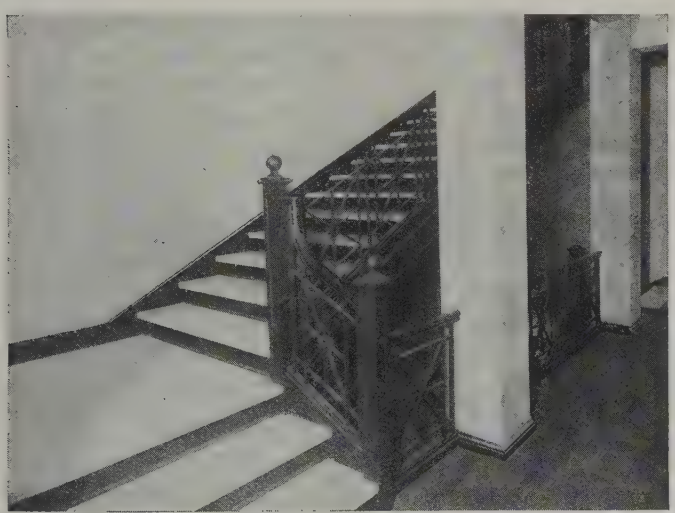
ORNAMENTAL IRON WORK:

Iron Stairs, Fire Escapes, Spiral Stairs, Steel Ladders, Iron and Bronze Railings, Pipe Railings, Folding Gates, Area Gratings, Window Guards, Grilles, Sidewalk Doors, Coal Chutes, Coalhole Covers, Marquises, Trusses, Beams, Columns, Metal Lumber, Balconies, Flagpoles, Steel Sash, Store Fronts, Iron Fences, Entrance Gates, Wire Fences, Wire Partitions.

Stair Specifications

All iron stairs shall be pressed steel as made by TITCHENER IRON WORKS, INC., Binghamton, N. Y.

Stringers—Shall be of 10-inch channels formed from 13x$\frac{3}{16}$-inch steel plates with moulding on top and bottom flanges as detailed.



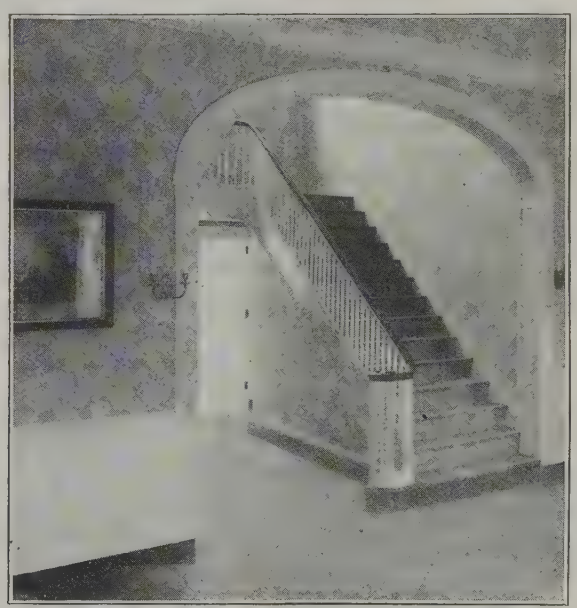
Tread and Riser—Shall be one unit formed from No. 12 gauge steel sheets with nosing and shall be recessed to receive 2 inches of composition or concrete filling. All treads and risers shall be supported by and bolted to angle iron hips which are riveted to the stringers.

Platforms and Landings—Shall be of No. 12 gauge steel sheets supported and reinforced by structural tees and angles riveted to stringers and platform channels.

Newel Posts and Railings—Shall be as per details.

All iron work to have one shop coat of approved paint.

Note: The above specification may be changed to meet all architects' requirements.



Gate Specifications

Horizontal rails shall be of 2-inch channels. Hinge bars shall be ¾-inch by 2½-inch flat iron, hung on hand wrought hinges to be laid into masonry. Latch bars shall be the same size as hinge bars. Pickets shall be ¾-inch square bars spaced 5 inches on centers with hand forged top either pointed or upset. Pickets shall extend through horizontal rails and be securely hand calked into place. All to receive one shop coat of approved paint.

SEXAUER & LEMKE, INC.

Ornamental Iron Work, Steel Stairs, and Cast Iron Work

LONG ISLAND CITY, N. Y.

REPRESENTATIVES: Shults Engineering Co., Morgan Building, BUFFALO, N. Y.

Products

Manufacturers of Ornamental Iron Work, including: "S & L" Fireproof Steel Stairs, and Steel Frames for Doors and Partitions.

Also General Iron and Steel Staircase Construction; Iron Grilles; Railings; Entrance Doors, Marquises; Elevator Enclosures; Store Fronts; Gratings; Fire Escapes; Fur Racks for cold storage plants, etc.

Service

The thoroughly equipped estimating and draughting departments are at the service of architects. Estimates and suggestive working details will be gladly submitted on request.

Facilities

Our plant is complete in every respect and equipped with the most modern types of machinery and tools, enabling this organization to meet promptly and efficiently all demands for its products.

Our plant is situated at the East River and provided with own docking facilities.

Sexauer & Lemke ("S & L") Steel Stair Construction

Simple, strong, rigid, exceptionally light and easily erected, these steel stairs lend themselves admirably to every type of public office, warehouse, hospital, school and factory building construction.

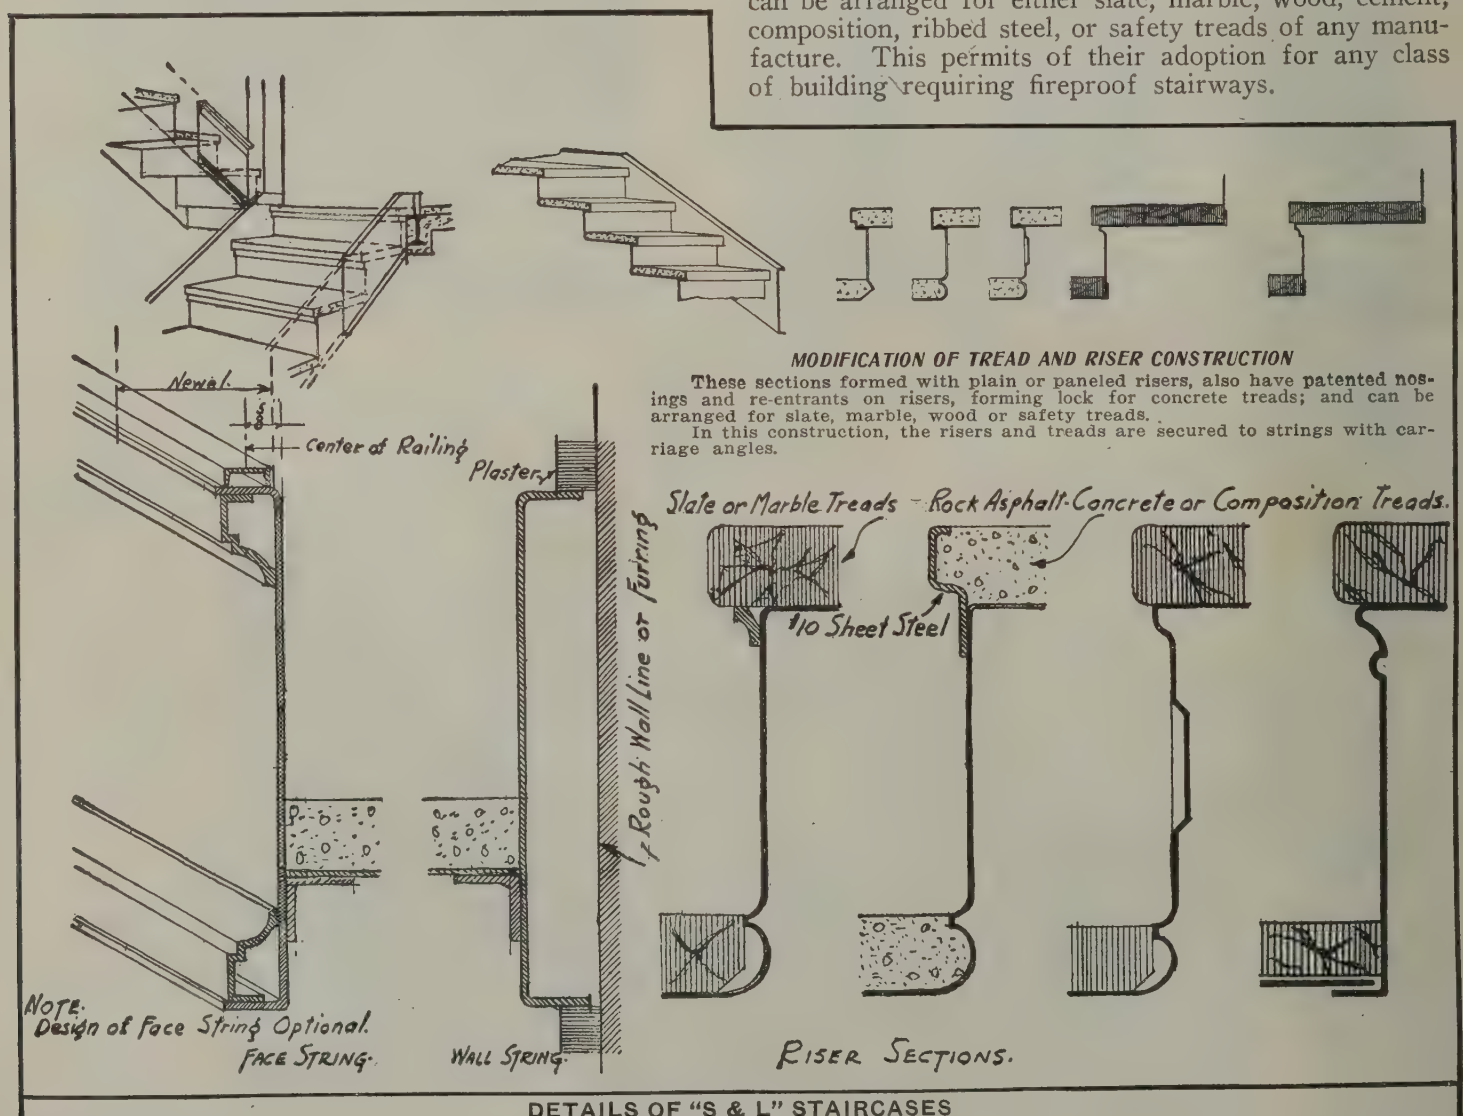
They are formed, primarily, of rolled steel stringers and bent plate steel risers and treads, securely bolted together as shown in line details herewith. The stairs can be furnished to accommodate any condition.

The strings are formed in one piece with flanges, the depth of string, thickness of metal, etc., being governed by the loading, and strings can be made either plain or ornamental with mouldings or otherwise as may be desired.

For stairs for export, the various strings, risers, etc., could be nested to insure compactness and against danger of damage.

All stair structures are figured for a safe live load of 100 lb. per sq. ft. and designed accordingly.

Design—"S & L" stairs can be built plain, or ornamented to any extent to suit architectural requirements and design, with railings and newels to match. Risers may be plain, or paneled and ornamented; treads can be arranged for either slate, marble, wood, cement, composition, ribbed steel, or safety treads of any manufacture. This permits of their adoption for any class of building requiring fireproof stairways.



DETAILS OF "S & L" STAIRCASES

Continued on next page

For cement or composition treads, a patented nosing and re-entrant construction is provided, which forms a pocket or lock for the treads and provides a sanitary cove treatment to the risers.

See detail drawing on preceding page.

The soffits of stairs are left open for painting, and present a neat finished appearance, but can also be arranged for plaster finish, if desired.

Installation—These stairs are particularly easy to erect, as each run is manufactured and fitted in shop before shipment or delivery. This feature insures quick and economical installation; and also permits of the stairs being erected with the framework of the building, thus insuring immediate serviceableness, before the installation of the finish treads.

General Cost and Estimates—These stairways, furnished complete with railing and newels (with concrete treads), are practically as low in cost as stairways of concrete construction with iron railings, and have the advantage of providing a neater and more durable installation. They permit, moreover, a saving in cost of structural supports, on account of special lightness. The thickness of metal employed, depth of strings, and so forth, are governed by the size of stair, loading conditions and so on.

If general layout of stairs together with memoranda of requirements is furnished, the estimating department will be pleased to submit specifications and estimates.

Circular Stairs, Special Stairs, Cast Iron Stairs

Details and information furnished upon request.

Cast Iron and Wrought Iron Front Work

We specialize on all types of this work.

Steel Door Frames

Frames can be formed to meet requirements of all classes of fireproof partition construction. They are formed of No. 14 or 12 gauge steel and the miters and connections are all welded, making a one-piece frame.

THE A. L. SMITH IRON WORKS

Manufacturers and Erectors of Steel Stairs

CHELSEA, MASS.

Products, Organization and Experience

SMITH STEEL STAIRS.

Also Designers, Fabricators and Erectors of Structural Steel and Ornamental Iron and Bronze Work of every description.

We have been building stairs of all types for nearly 30 years. This broad experience, together with the use of sound engineering principles, has developed the Smith Steel Stair, the features of which have been fully patented.

Our modern plant, modern production methods, efficient workmen and standardization of parts enables us to produce Smith Steel Stairs economically, but consistent with substantial and permanent construction.

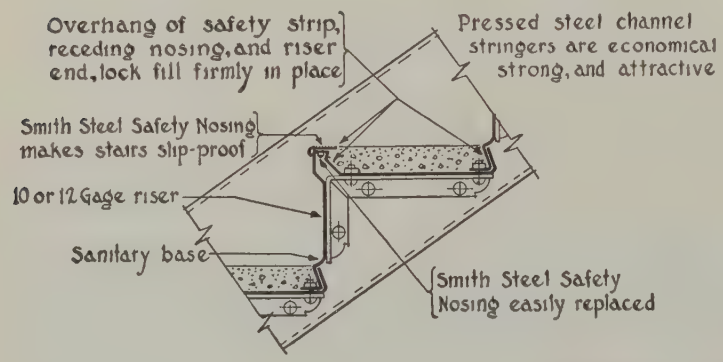
Smith Steel Stairs

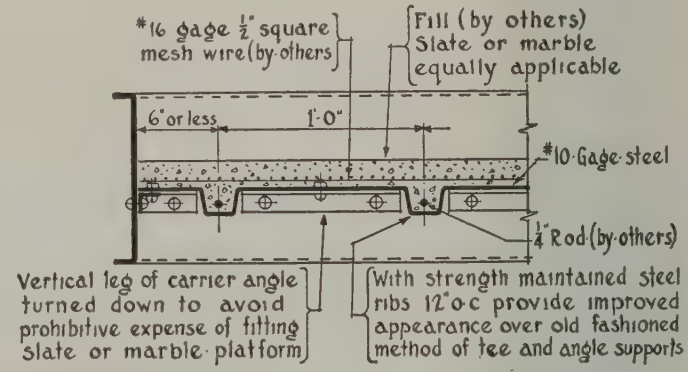
The general description and features of construction of Smith steel stairs are completely covered by the standard specifications and illustrations shown on these pages.

Smith steel stairs are suitable for all classes of buildings and are being specified by leading architects and engineers because of their strength, pleasing appearance and low cost. They have been subjected to severe tests, including the following:

A stair loaded with 48 men weighing 7200 lb., on 71 sq. ft. (101 lb. per sq. ft.), showed no evidence of strain. Another stair loaded with 43,000 lb. of steel plates on 71 sq. ft. (equivalent to 600 lb. per sq. ft., which, on the basis of 100 lb. per sq. ft. gives a factor of safety of 6), showed no indication of failure.

These tests clearly show the relation of maximum possible human loading in actual practice against the ultimate carrying capacity of the stairs.





Features of Smith Steel Stairs

Standard Specifications for Smith Steel Stairs

All stairs marked steel on plans shall be Smith Steel Stairs made (and erected) by THE A. L. SMITH IRON WORKS, Chelsea, Mass.

Stringers shall be 10-in. pressed steel channels $\frac{3}{16}$ in. or ¼ in. thick as required.

Treads and risers shall be of the Smith one-piece nosing type and shall be No. 10 or No. 12 gauge as required. Treads shall be attached to carrier with two bolts. Fill and reinforcing shall be furnished by others.

Carriers shall be $1\frac{1}{4}$x$1\frac{1}{4}$x$\frac{3}{16}$-in. angles, machine riveted to stringers with three rivets. Rivets shall be countersunk on outside face of face stringer.

Landings shall be of the Smith one-piece pressed-rib type of No. 10 gauge steel. Ribs shall be supported by angle at wall and sides and by steel channel at head of stairs. Fill and reinforcing shall be furnished by others.

Posts shall be Smith Type ...., made of .... in. square, with standard cap and drop.

Railing shall be Smith No. .... attached to channels top and bottom. Wood handrail shall be furnished and attached to top channel by others. (See details of posts and railings for various types and their numbers.)

Safety treads, where shown on plans, shall be Smith replaceable steel safety nosing.

Railings.
Fire Escapes.
Also Miscellaneous Iron and Wire Work of all kinds.

"Tolico" Steel Stairs

Our standard steel stairs are of the pan type with J & L or bent plate channel stringers as illustrated on the following page.

Note the full carriage angle supports for both the tread and riser and the fact that these angles are riveted to the stringer insuring absolute safety.

Our stairs are erected more readily than others, due to the fact that the stringers are fastened to the newels by means of a mortise and tenon joint. No field bolts or pins are required for connecting stringers to newels as stringers slip readily into place and the structure becomes absolutely rigid. This connection also eliminates all unsightly connection angles or rivets.

We are prepared to furnish any style of moulded stringer and facia, and any style of pressed steel or cast iron tread and riser to comply with the architect's designs. We have a large number of stock patterns of cast iron newels, railing panels and steel tubing newels, or we will make up or follow special designs as required.

A catalogue of our standard patterns will be sent on request.

Cast Iron Store Fronts

We design cast iron store fronts, facias, etc., complying closely to architects' requirements, but using stock patterns. These can be furnished in virtually any period or style. We can also comply exactly with special designs requiring modeling or carving.

Structural Steel

We manufacture an entirely new design of bow string truss complying with all requirements of the American Institute of Steel Construction which is competitive in price and weight with any truss now on the market. Estimates and design sent on request.

In addition, we fabricate a general line of structural steel, covering jobs up to 200 tons. Estimates furnished.

"Ideal" Steel Stairs

"Ideal" steel stairs are the result of eighteen years of experience in stair building.

They are fabricated by experts in a modern shop with modern facilities of every description.

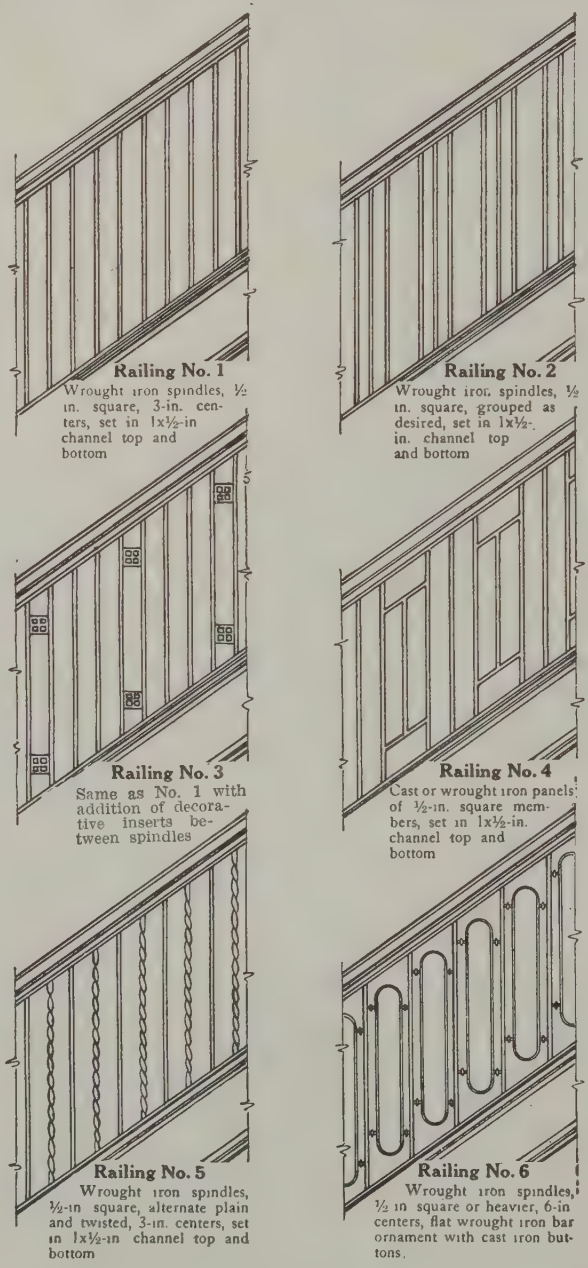
Quality of workmanship in "Ideal" steel stairs is never surpassed and seldom equalled.

Every "Ideal" steel stair is set up complete in the shop before shipment, which insures a perfect fit at the building and results in economy of erection labor.

It is for these reasons they are endorsed by all prominent architects and builders.

Write to us and we will be pleased to furnish additional information and estimates.

We have only attempted to show a few simple designs of railings and newels most commonly used. We can furnish any special railings and newels desired and have many patterns of elaborate design in stock which can be used when something better is desired, without the original high cost of patterns and models.



Railing No. 1
Wrought iron spindles, ½ in. square, 3-in. centers, set in 1x½-in channel top and bottom

Railing No. 2
Wrought iron spindles, ½ in. square, grouped as desired, set in 1x½-in. channel top and bottom

Railing No. 3
Same as No. 1 with addition of decorative inserts between spindles

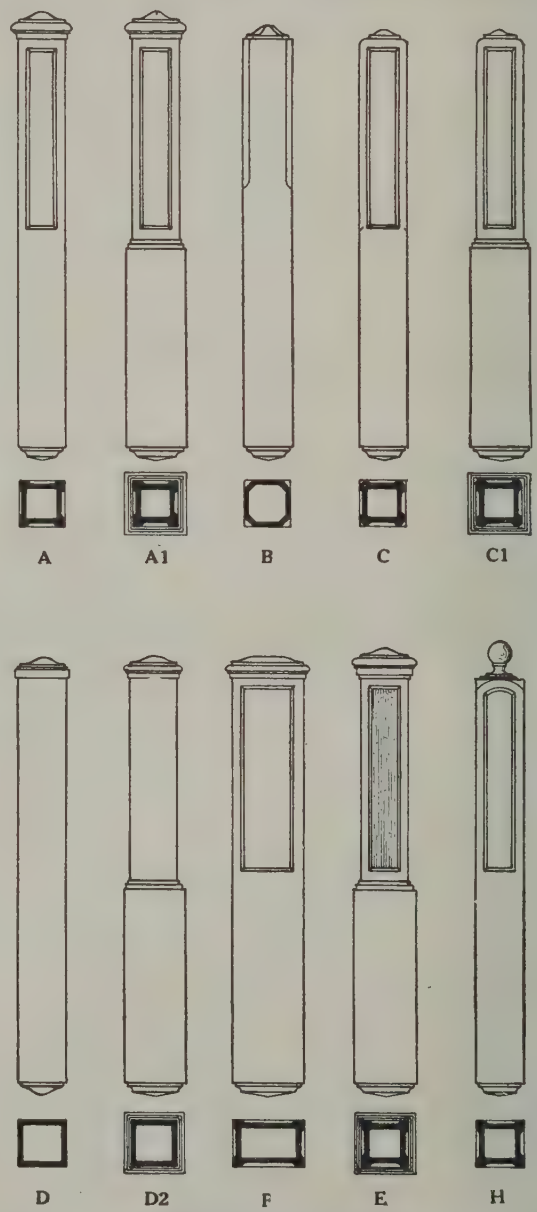
Railing No. 4
Cast or wrought iron panels of ½-in. square members, set in 1x½-in. channel top and bottom

Railing No. 5
Wrought iron spindles, ½-in square, alternate plain and twisted, 3-in. centers, set in 1x½-in channel top and bottom

Railing No. 6
Wrought iron spindles, ½ in square or heavier, 6-in centers, flat wrought iron bar ornament with cast iron buttons.

Standard Railings

Note. **In all cases handrail can be of wood or metal. Any special railing and newel designs can be furnished.**



STANDARD NEWELS

Style	Shaft	Style	Shaft
A	3, 4 and 5-in. square	D	3, 4 and 5-in. square
A1	3, 4 and 5-in. square	D2	3, 4 and 5-in. square
B	4 and 5-in. square	F	6x4 in. rectangular
C	4 and 5-in. square	E	4-in. square
C1	4 and 5-in. square	H	4-in. square

WOLVERINE IRON WORKS

Manufacturers of Steel Stairs and Ornamental Iron Work

6782 Goldsmith Avenue
DETROIT, MICH.

Products

"Wolverine" Steel Stairs (a specialty).

Also Ornamental Iron Work, including cast iron Store Fronts, Spiral Stairs, Ornamental Railings, Window Guards, Elevator Enclosures, Marquises, etc.

"Wolverine" Steel Stairs

Stringers—Of rolled steel cut channel section, 10 to 15 in. wide; also of plate, 10 to 14 in. wide; ⅛ to ½ in. thick. Face stringers are covered with heavy steel mouldings, paneled.

Treads and Risers—Formed of Nos. 10, 12 or 14 gauge steel in one piece with nosing, and can be used for the various tread materials as illustrated in the details.

Newels—Are of *steel;* either plain square newels of sizes ranging from 2 to 5 in. square, or paneled steel newels of sizes ranging from 2½ to 5½ in. square, as illustrated in the details, with cast iron caps and drops attached.

Erection

Correctly and scientifically constructed, these steel stairs are designed to be erected by ordinary tools as found on any job. Being so easily assembled, they are suitable for a wide range of use, from the checkered tread of fire escape stairs to the staircase decorated with period ornamentation, as used in buildings of the highest grade.

Costs

"Wolverine" steel stairs compare favorably in cost with any other metal stair. Not only is their installation cost low, but the cost of manufacture has been reduced to a minimum through the use of specially designed machinery.

Information

Information relative to weights, costs, deliveries, construction details, designs or existing installations will be furnished on request.

Cast Iron Store Front Windows and Marquise, 600 ft. Long on 3 Sides of New Hudson Store Building, Detroit, Mich.

Cast Iron Work

With our fully equipped pattern shop and foundry, with expert modelers and moulders in the production of fine ornamental iron castings and our fitting shop with skilled and experienced workmen, we are able to produce fine cast iron work from architects' designs promptly.

Sixty-two cast iron window frames for the new Hudson Store Building, Detroit, Michigan, were delivered in 40 days after receipt of order, the first frame in 14 days.

Wrought Iron

In our wrought iron department we have blacksmiths capable of producing ornamental wrought iron work of the finest quality from architects' designs.

Designing

We are prepared to furnish designs in cast and wrought iron work, and by using patterns selected from our storage can design store fronts, marquises, etc., that will be in harmony with architectural designs at a minimum cost.

Manufacturers of PresTeel Stairways

1521 Altgeld Street

CHICAGO, ILL.

REPRESENTATIVES IN PRINCIPAL CITIES

Product

PRESTEEL—"Tested for Strength" —STAIRWAYS.

Strength Tests

Armour Institute of Technology, Chicago, Ill., was selected by our consulting engineers as the best place to conduct exhaustive strength tests of Woodbridge PresTeel Stairways. Separately, stringers, treads, risers, platform channels, tees, hanger rod connections, newel post connections and other parts and connections were subjected to various tests to determine their carrying capacity. Also various designs of completed stairways were subjected to applications of ultimate loads.

From this data, our engineers were enabled to design stairways equal to all requirements, not only in the stringers or platforms, but in all of the component parts.

Exhaustive research has given us a set of tables that definitely eliminate guesswork as to the actual live load that can be carried when using varying weights of metal.

Guarantee

We unequivocally guarantee, without any exception whatever, the satisfactory completion of any work with which we are intrusted; and, without reservation, guarantee all workmanship and materials against defects and to be exactly as represented.

Design

The Woodbridge Standardized PresTeel Stairways can be furnished plain or ornamental to suit any architectural design, with railings and newel posts to match. The risers may be plain or paneled, the treads can be arranged for marble, slate, cement, terrazzo, rezilite, alberene, asphalt, mosaic, cork, carpet, wood, linoleum, or any composition filling, with or without sanitary cove. The soffits of stairs are usually left open and present a neat finished appearance, but can also be arranged for plastering if desired.

Construction

Our construction provides a light, inexpensive, strong, durable, non-combustible and easily assembled stairway. It is adaptable to office, hotel, warehouse, factory, school, church, lodge hall and hospital construction; in fact, any building where fire-resistant construction is required.

Woodbridge Stairways are built with stringers made of PresTeel, thickness not lighter than $\frac{3}{16}$ in. The treads and risers are made of one piece of blue annealed steel pressed into the form required, platform plates are made of blue annealed steel reinforced with the necessary channels and tees, all securely bolted and riveted together. Our construction is so designed and planned as to form a permanently rigid and therefore noiseless stairway. The thickness of metal used for the treads and risers as well as stringers depends upon the safe live load requirements and the length of span.

The Woodbridge Patented Standardized PresTeel Construction is reinforced at nosing, which prevents the nosing from breaking away from the tread filling. This stair tread will absolutely stand up at this point under the constant wear and tear the tread nosing must withstand.

The stair assembled forms a solid mass which is free from vibration under loading stress, both vertically and laterally. The strength of our construction insures the maximum of efficiency against damage or failure in case of fire.

Manufacturing Details

Special attention is called to the details of the Woodbridge standardized manufacture. Only the best of materials and workmanship goes into the makeup with a view to making these stairs last forever—if such a thing were possible—and thus reducing cost and upkeep to a minimum.

Our product is made to last—to withstand the hardest usage—to embody all the necessary requirements and to give the greatest value possible for the money expended.

Cheap material and construction only increase the cost of an article, in added repair and replacement charges.

Installation

Woodbridge Stairways are exceedingly easy to erect. Each flight is erected, inspected and marked in our factory, then knocked down for shipment. If contractor desires to do his own erecting, we furnish shop details and printed erection instructions when shipment is made. A good man and helper can erect two flights of stairs per day, unless stair is extremely complicated. This company will be glad to handle the erection for those unable to take care of this work.

We often erect these stairs with the framework of the building, thus putting the stairs into immediate service, The tread filling is afterwards put in when the structure is nearing completion.

Painting

All Woodbridge Stairways are given one shop coat of battleship gray rust inhibitive metal coating, applied by the air brush process. We do no painting in the field.

Service to Architects

Our thoroughly organized Engineering, Estimating and Sales Departments are at the service of architects, engineers and builders. For those interested in designing and detailing stairway construction, our standardized construction in ¾-in. scale drawings for use in the drafting room, will be furnished upon request.

The Woodbridge Patented PresTeel Tread and Riser

Made of one piece of No. 12, No. 14 or No. 16 Gauge Blue Annealed Steel, depending upon safe load required and length of tread

Plaster Soffits unnecessary with this construction.

By placing angle iron in this position one man can set treads and risers. No scaffolding or ladders necessary

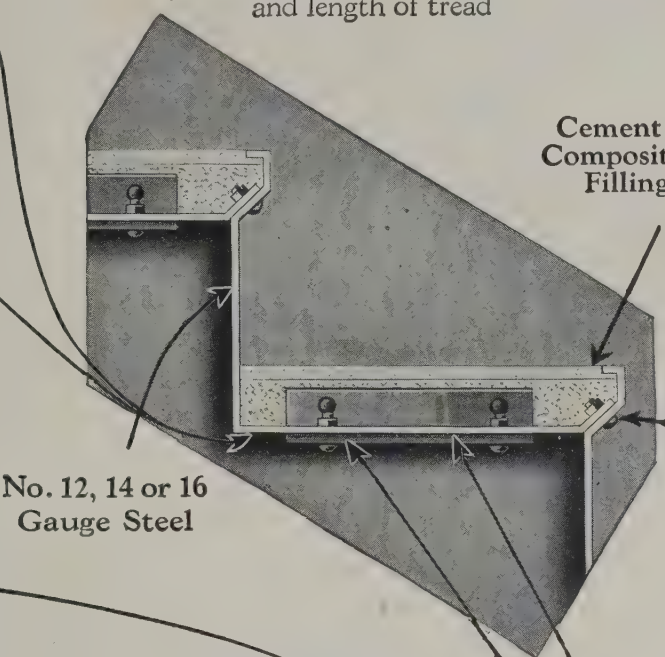
All angle irons cut to the same length and carried in stock.

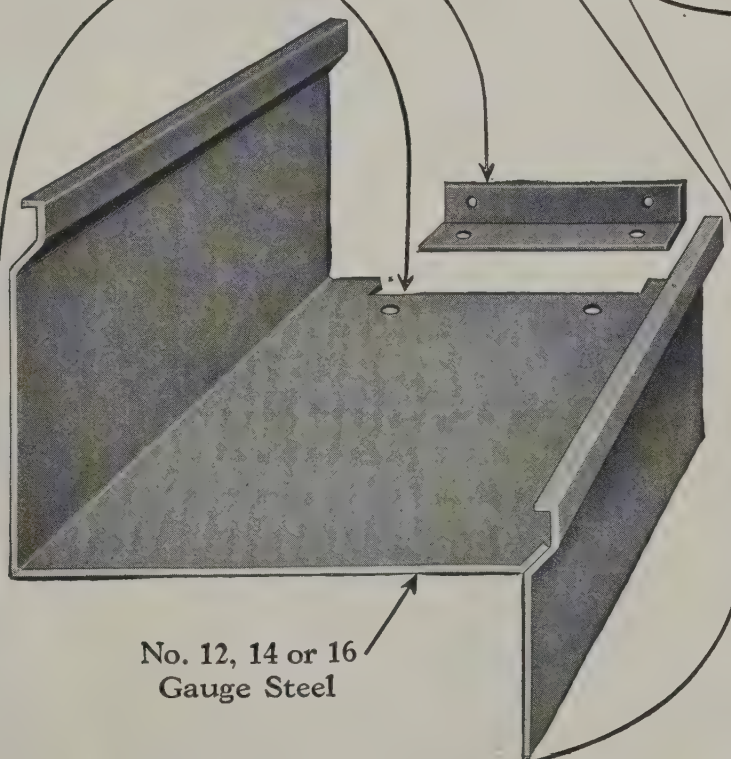
All holes in angle iron are punched in 2 operations.

The recess in treads positively gauges and positions treads.

Treads are recessed and punched in 1 operation.

Only lower side of angle iron exposed.





Construction allows for variation in width of treads.

Construction strengthens risers, making braces or anchors unnecessary. Nosing positively will not break away from concrete or other fill.

This construction partially conceals bolt heads.

No unsightly construction from below.

Full strength of angle iron utilized in supporting tread.

Note how accessible these bolts are from the top for tightening.

We do not depend on these 2 bolts to support treads.

THIS type of stair construction has passed the experimental stage as we have installed them in all principal cities of the United States. It meets all the requirements of the building and fire ordinances, and is recommended by leading Architects and Engineers.

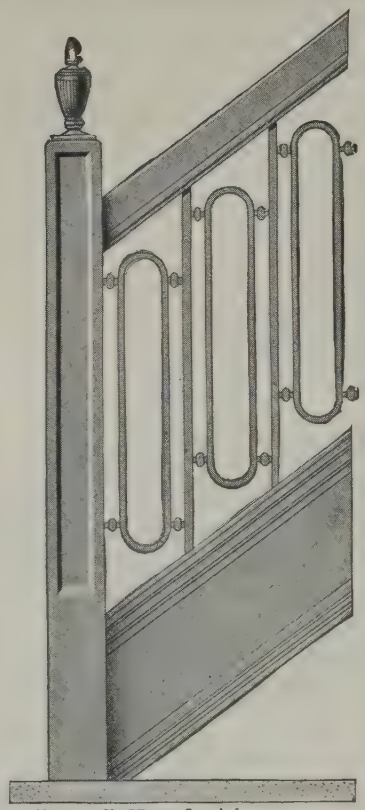
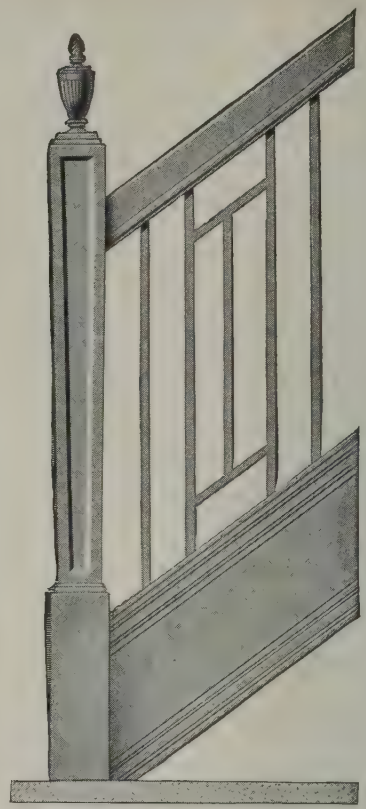
Type J Newel—4 in. square cast iron.

Design No. 12 Rail—Spindles are ½-in. square wrought iron bars, 3 in. on center, set in 1x½-in. channels and with a 1x½-in. flat bar at top and a 1x½-in. channel at bottom.



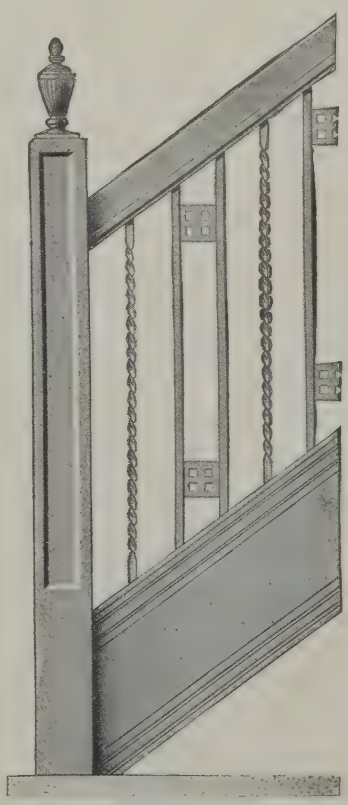
Type G Newel—4 in. square cast iron, rounded corners.

Design No. 14 Rail—Spindles are ½-in. square wrought iron bars, 6 in. on centers; ornament is $\frac{3}{16}$x⅜-in. wrought iron bar with ornamental iron separators between.



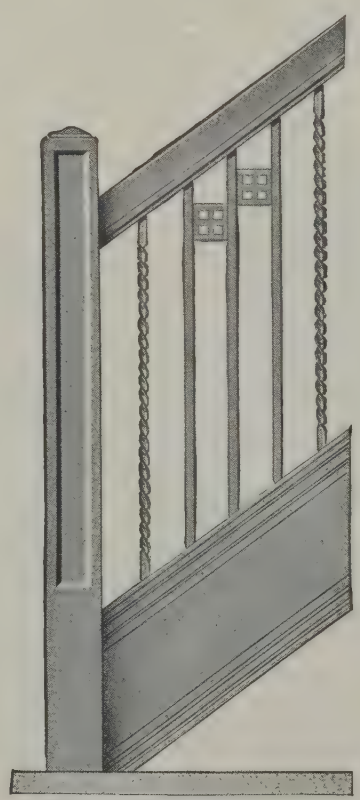
Type L Newel—4 in. square cast iron tapered shaft, bronze urn top.

Design No. 3 Rail—Spindles are ½-in. square wrought iron bars, 3 in. on centers, arranged in panel form with single spindle between panels. Spindles set in 1x½-in. channels at top and bottom.



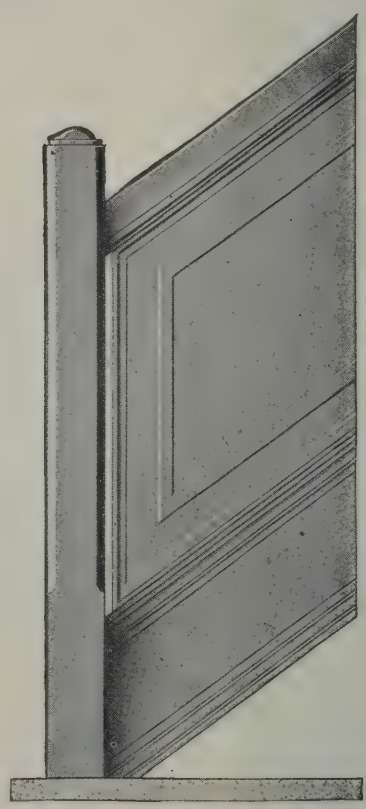
Type G Newel—4 in. square cast iron, rounded corners.

Design No. 20 Rail—Spindles are ½-in. square wrought iron bars, set 3 in. on centers, in a 1x½-in. channel at top and bottom. Also available with two twisted spindles between panels.



Type F Newel—4 in. square cast iron, rounded corners.

Design No. 19 Rail—Spindles are ½-in. square wrought iron bars, set 3 in. on center, in a 1x½-in. channel at top and bottom. Two cast iron ornaments between spindles at top.

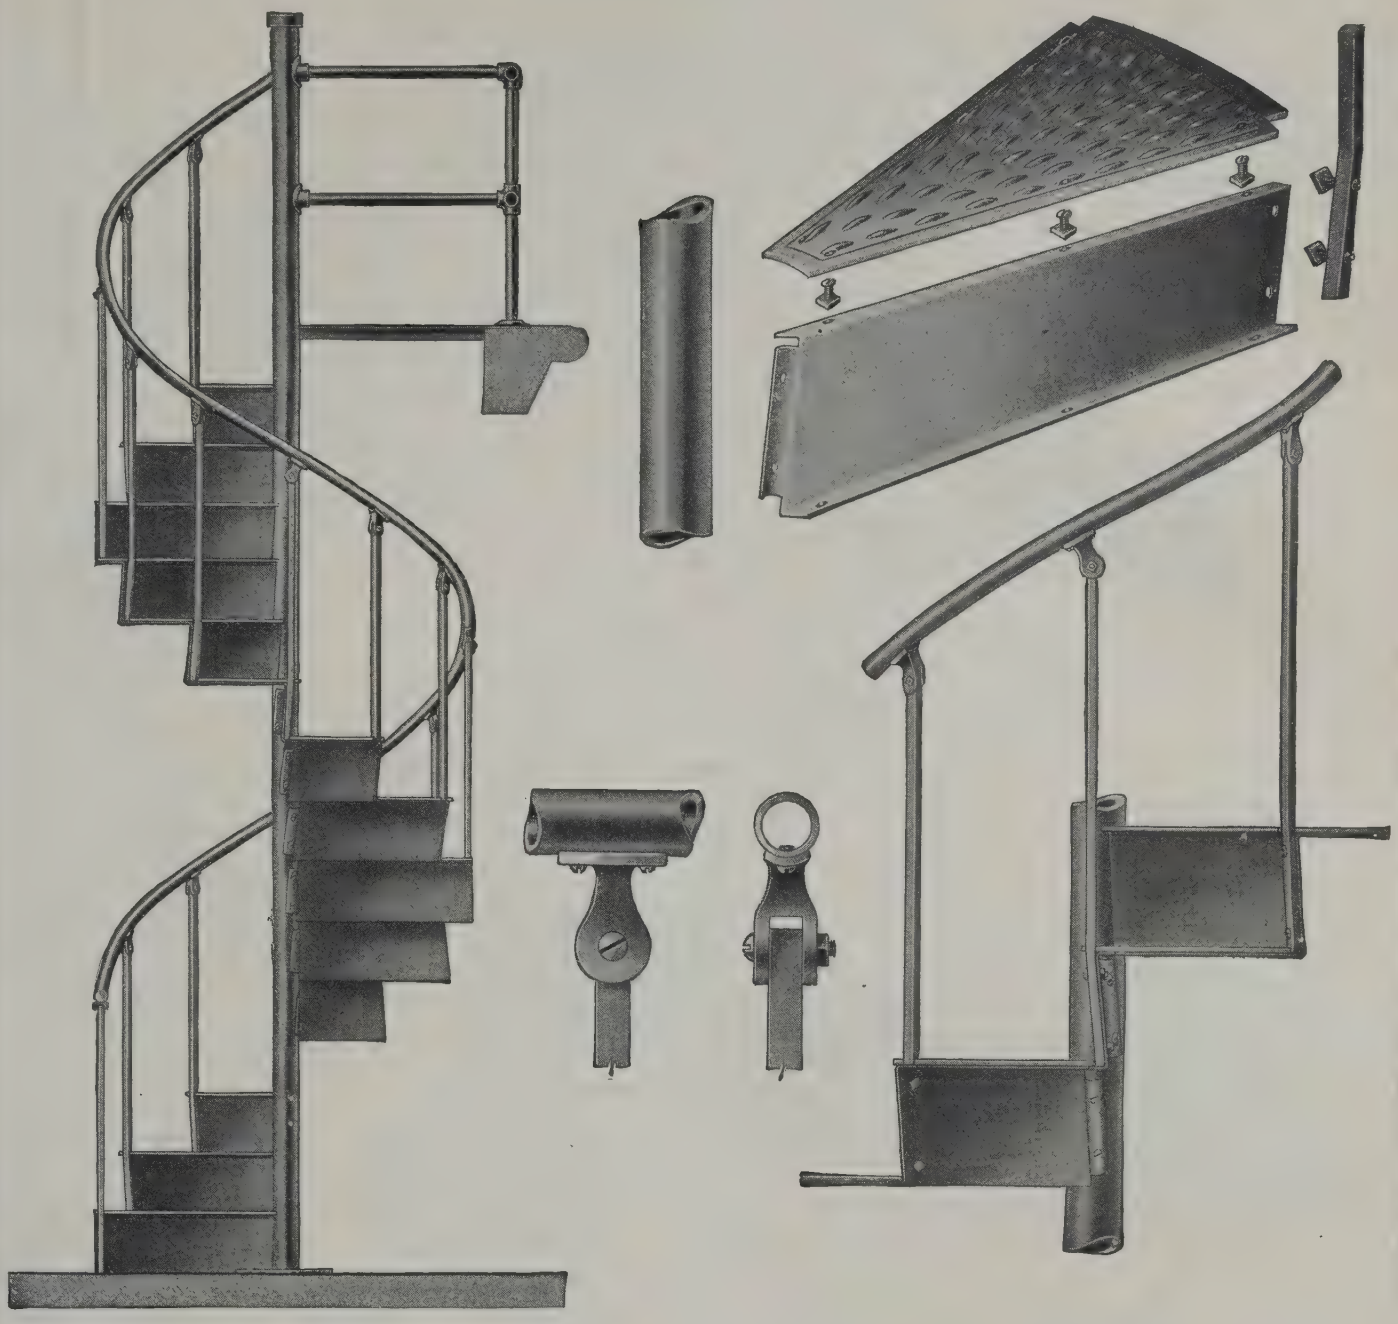


Type D Newel—4 in. square cast iron, beveled corners.

Design No. 22 Rail—Closed rail, adapted to schools, etc., made of No. 12 gauge steel paneled with 1x⅛-in. flat bars. Can also be furnished with panels omitted.

Combinations of Railings and Newel Posts

Continued on next page



Woodbridge Spiral Stairway Design No. 20B

Notice the greater beauty of this latest design. Compare it with other spiral stairways that are on the market.

This new spiral, like all Woodbridge Stairways, is exceedingly easy to erect. All parts are marked and treads and risers are interchangeable.

Description—

Treads are made of cast iron with diamond pattern surface to match steel diamond plate platform.

The same casting is used for right or left-hand treads. All treads are interchangeable and easily removed.

The risers are made of No. 12 or 14 United States Standard gauge steel.

Each riser is flanged and bolts to the center pipe.

The uprights are made of ¾-in. square bars and are bolted to each riser.

The handrail is made of 1½-in. inside diameter pipe and is rolled to exact radius required.

Platform is made of $\frac{3}{16}$ or ¼-in. diamond plate steel which matches surface of treads.

The New Woodbridge Spiral Stairway

THE BESSLER DISAPPEARING STAIRWAY CO.

AKRON, OHIO

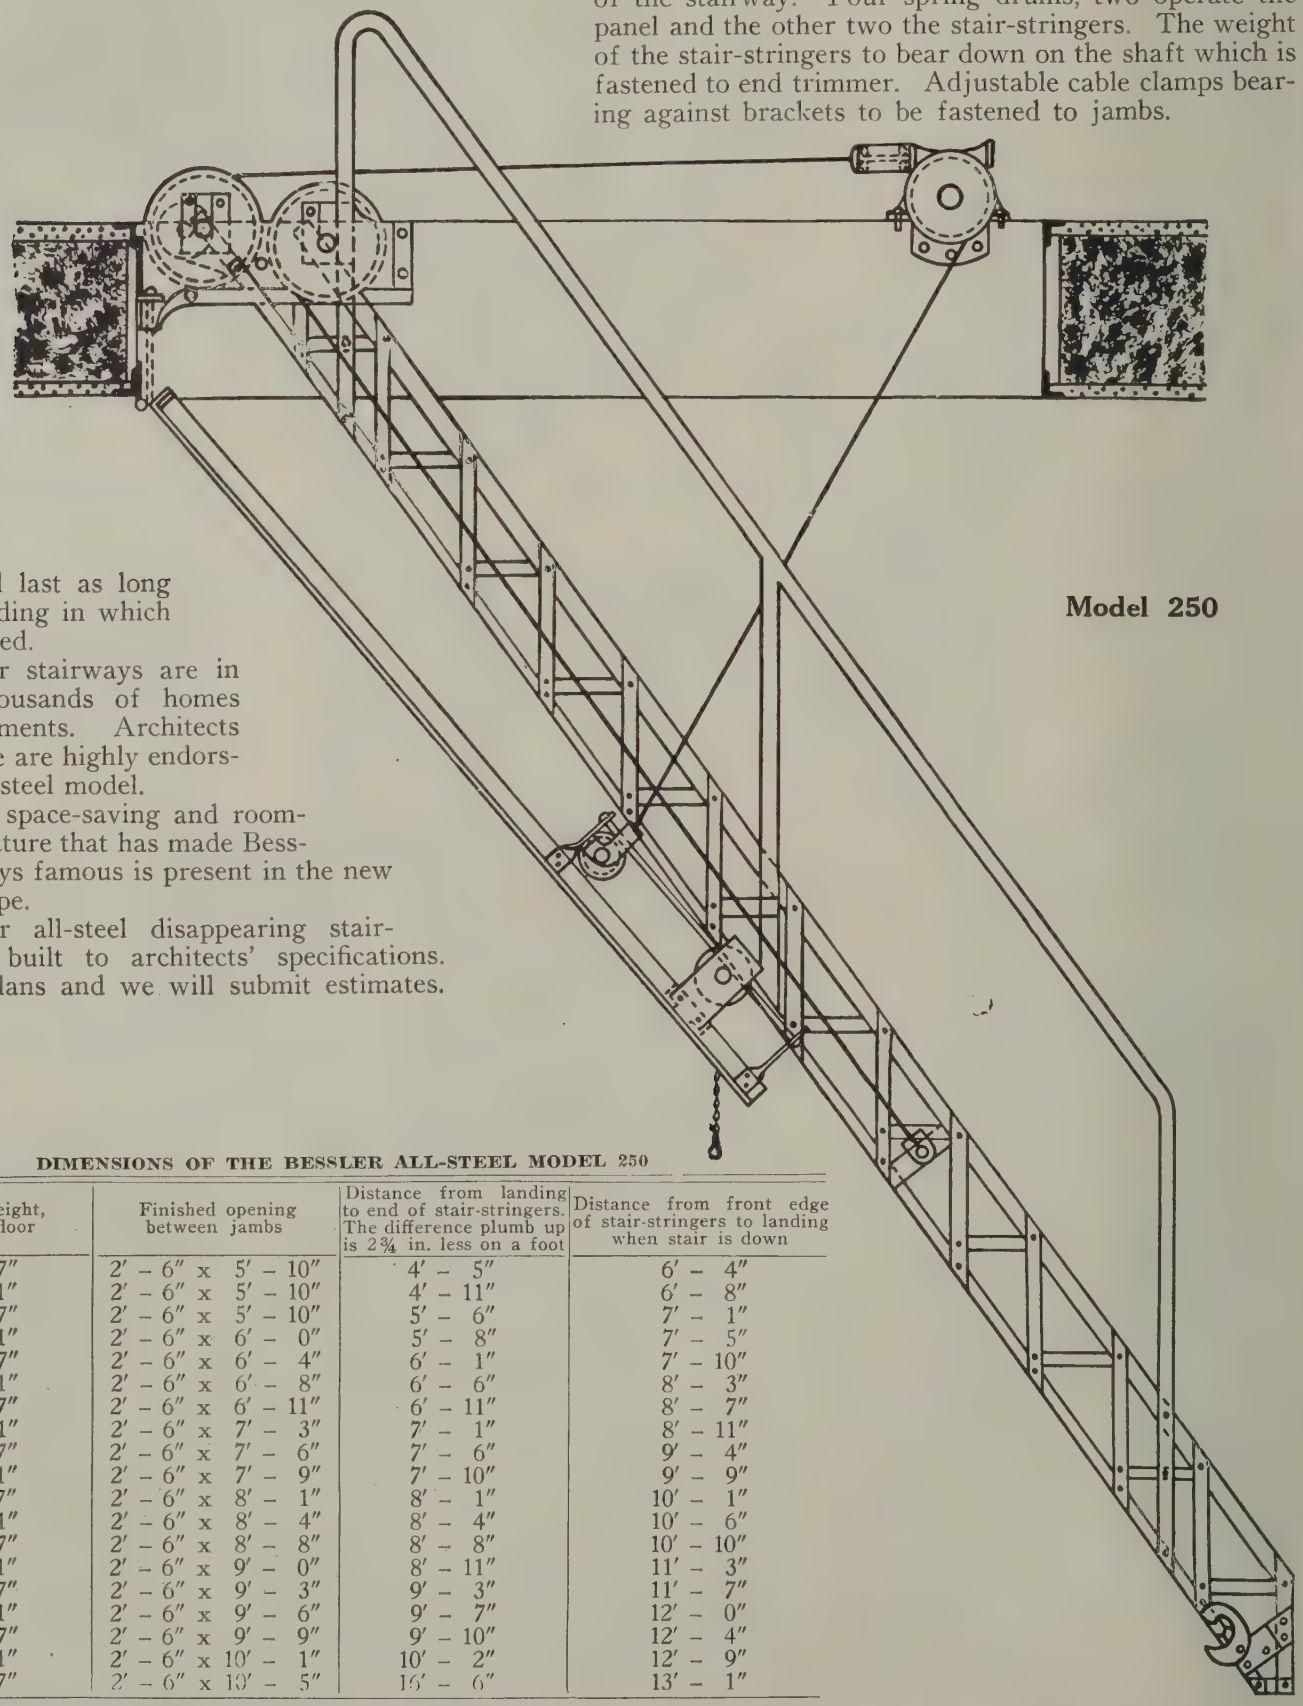
For Bessler Wood Models, see pages B1572-1573 in the Carpentry Section

Bessler All-steel Disappearing Stairway, Model 250

The all-steel stairway is fireproof and burglarproof, and is suitable for use where every hazard must be eliminated and every possible feature of safety must be provided.

Specifications

Stairway to be all-steel mounted on panel to slide on rollers. Panel to have adjustable hinges permitting edge to come to bottom of ceiling. Hand rail for right or left side. One equalizing bar is to be on each side of the stairway. Four spring drums, two operate the panel and the other two the stair-stringers. The weight of the stair-stringers to bear down on the shaft which is fastened to end trimmer. Adjustable cable clamps bearing against brackets to be fastened to jambs.



Model 250

It will last as long as the building in which it is installed.

Bessler stairways are in use in thousands of homes and apartments. Architects everywhere are highly endorsing the all-steel model.

Every space-saving and room-making feature that has made Bessler stairways famous is present in the new all-steel type.

Bessler all-steel disappearing stairways are built to architects' specifications. Send us plans and we will submit estimates.

DUVINAGE SPIRAL STAIR CO.

Manufacturer of Spiral Stairs

89 West Lee Street
HAGERSTOWN, MD.

Product

DUVINAGE IRON SPIRAL STAIRS.

Duvinage Iron Spiral Stairs

Duvinage spiral stairs have been erected and approved for their simple, durable construction as well as their economy in floor space, in offices, churches, theaters, stores, mezzanines, boiler rooms, sewage disposal pumping wells, power plants, gas houses, water towers, mines, cement plants, etc.

They are made of the best grade of iron; have single 1-in. pipe railing on stairs and double rail around well; and center pipe 3 in. for 42 and 48-in. stair, and 4 in. for 54 to 96-in. stair.

The regular stock treads of these stairs can be furnished either right or left hand (illustration shows right hand) and 12 or 16 treads to the circle. Riser heights are affected by height between floors.

To provide sufficient headroom under top platform, risers should not be less than 8¼ in. high. By calculating number of risers required, the relative positions of starting and landing points can be determined, and a right or left-hand stair decided upon.

In ordering, give diameter, distance between floors, starting point, and position of landings desired. The *60-in. diameter is the best to use.*

Send for Catalogue No. 58.

ABRASIVE-METALS
ALUMALUN FERALUN BRONZALUN
FERROX
CARBORUNDUM

Products

Manufacturers of ABRASIVE-METALS:

FERALUN, BRONZALUN and ALUMALUN for Anti-Slip Tread Surfaces; FERROX for Drill and Torch Resistant Bank Vault Linings and Door Plates.

Sole Sales Representatives for ANTI-SLIP TILE.

Code Requirements

Largely on account of slippery and unsafe walkway surfaces "Falls of Persons" are *annually* causing more than 17,000 fatalities and nearly 2,000,000 serious injuries in the United States. The building and safety codes of several States, numerous large cities and industrial organizations now require walkway surfaces of higher frictional resistance than formerly used for certain purposes.

Approvals

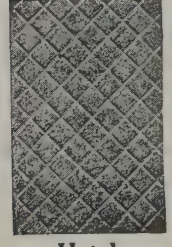
The Underwriters' Laboratories, Inc., approve Feralun without qualification as providing a fire-safe, anti-slip tread. The State industrial boards of New York, Pennsylvania and Ohio, as well as insurance carriers in general, recommend Abrasive-Metal Treads to avoid slipping hazards.

Abrasive-Metal Anti-Slip Tread Surfaces

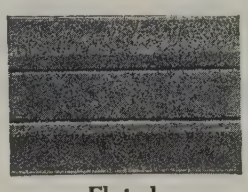
Feralun, Bronzalun and Alumalun are the different abrasive-metals used for anti-slip tread purposes. They are the indicated metals with abrasive grain incorporated in the wearing surface at the time of casting. This grain, projecting slightly, "bites" or provides a high frictional resistance which eliminates the slipping hazard. It covers and protects against wear the metal matrix in which it is firmly embedded, assuring extreme durability with freedom from maintenance troubles. Inasmuch as the grain is cast in the metal matrix, there is no possibility of disintegration.

Uses—Abrasive-Metals are especially adapted for walkway surfaces where sure protection against slipping and great durability are desirable. Representative hazardous locations that can and should be made safe through the use of the desired Abrasive-Metal are:

Stair treads and landings
Floor plates
Trench covers
Elevator door thresholds
Freight elevator landings
Drainage gratings
Entrance door saddles
Coalhole covers
Ramps
Shipping platforms



Hatch



Fluted

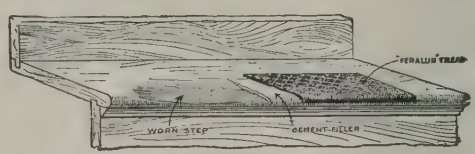
Plain

Sizes and Designs—Abrasive-Metal treads are obtained in practically any form in which metal may be cast. Certain forms are so frequently ordered that they have become standardized and are illustrated in detail on the second and third pages following. (These details in larger size for tracings will be sent on request.)

The wearing surface is furnished plain, fluted or hatched as specified.

Stair Treads—In Abrasive-Metal stair treads the anti-slip element is carried well down over the nosing edge. This is a most important safety feature, for it is the nosing that is the contact point of the foot when descending. Either plain or hatched surface is furnished. Grooves parallel to the edge are not recommended; they are hazardous and often cause tripping. Various designs of structural or surface treads shown in details are standard. (See Plates 1, 2 and 3.)

Repairs to Worn Steps—Styles A, C or D are applied to existing steps. Style A, long lip, is especially designed for covering badly worn steps. (See Plate 8.)



Method of Repairing Worn Wood, Concrete, Slate, Iron or Marble Steps with Style A Feralun Anti-Slip Treads

Anti-Slip Thresholds and Saddles—Especially desirable at entrance doors and exposed locations. Styles L and T are extensively used. (See Plate 6.)

Elevator Thresholds—The elevator code, approved by the American Engineering Standards Committee as an American Standard and now in effect, requires that "the landing threshold shall be constructed and maintained so that persons will not readily slip thereon." Abrasive-Metal thresholds provide the necessary quality and, unlike the ordinary cast or extruded variety, are very sturdy and not slippery. The grooves or slots for door guides are machine-planed and straight, true, free from fins, and correct to 5/1000 in.

Made in any of the three metal bases to harmonize with architectural requirements.

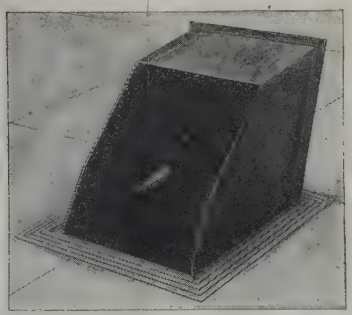
For Ramps and Grades—With steeper grades Feralun may be used and much space saved. Firm, even traction is essential in garages. When ramps are tracked or covered with Feralun, they give a feeling of security to every car owner, and are positive protection against the damage caused by one car skidding into another or into posts and walls. (See Plate 5.) Desirable also where hand trucking is done.

Floor Plates and Trench Covers—To avoid the slipping hazard Abrasive-Metal (Feralun) Plates are particularly desirable where there is heavy wear. On oil covered areas Feralun does not lose its effectiveness against slipping—especially desirable around heavy machinery. (See Plate 5.)

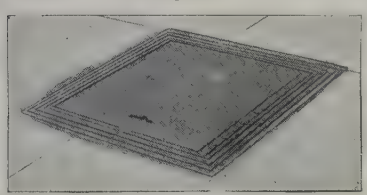
Continued on next page

Feralun Safety Coalhole Covers and Frames

Made of iron with emery cast into the wearing surface. Not slippery even when wet. Have no heel-catching projections or depressions; flush with sidewalk. When open, they are enclosed on all sides and top, except toward curb where coal chute is inserted. Hinges especially constructed to overcome breakage and are concealed. Easy to install, cost nothing to maintain. Made in three sizes: 18, 20 and 24 in.



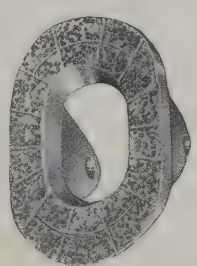
Open



Closed

Feralun safety covers and frames comply with the requirements of New York City Department of Public Works.

Alumalun Non-skid Ladder Shoes



Abrasive in the bottom face of the shoes keeps ladders from slipping on iron, steel, wood and concrete floors. Easily applied. Always ready. Light in weight, 12 oz. each. Cost less than accidents.

Specifications for Abrasive-Metal Treads

Concrete Steps, Platforms and Landings—All concrete steps, including nosing edges of platforms and landings, shall be equipped with "Feralun" [Style A, C or D] as made by American Abrasive Metals Co. Style A shall extend continuously along the step to within .... inches (3 to 4 in.) of stringers. Style C and D shall extend from string to string. Treads shall be .... inches (at least 4 in., and preferably 6 to 7½ in.) wide. Treads shall be set flush with the cement surface and firmly secured with anchors. Surface of treads shall be kept free from all cement finish.

Iron Stairs with Risers—All iron stairs with risers shall be equipped with "Feralun" [Style O, S or K] as made by American Abrasive Metals Co.

Iron Stairs without Risers—All iron stairs without risers shall be equipped with "Feralun" [Style R or R-K] as made by American Abrasive Metals Co. Style R and R-K are cast with lugs to be bolted to the stringers. Style K may be used bolted to angles on stringers.

Elevator Door Thresholds—All elevator door thresholds shall be "Feralun" [Style V-1 or V-2] as made by American Abrasive Metals Co.

Door Saddles, Exterior and Interior—All entrances, interior, and fire door saddles shall be "Feralun" [Style L, T, W or M] as made by American Abrasive Metals Co.

Walkway Surfaces—All (mention location, such as boiler room floors, floors around machinery, inclines, ramps, elevator floors, vestibules, freight corridors, trench covers, drainage gratings, coalhole covers, etc.) shall be "Feralun" as made by American Abrasive Metals Co. and as shown on plans.

Note: At locations where architectural effect is desired, "Bronzalun" or "Alumalun" may be substituted for "Feralun" in the above.

Anti-Slip Tile—For specifications for Carborundum Anti-Slip Tile see third page following.

Anti-Slip Terrazzo Aggregates

Used in place of 10% to 20% of the marble chips in terrazzo, or troweled into a granolithic finish, these aggregates, developed especially for the purpose, make such walkway surfaces more durable and slipproof.

Ferrox Bank Vault Linings and Door Plates

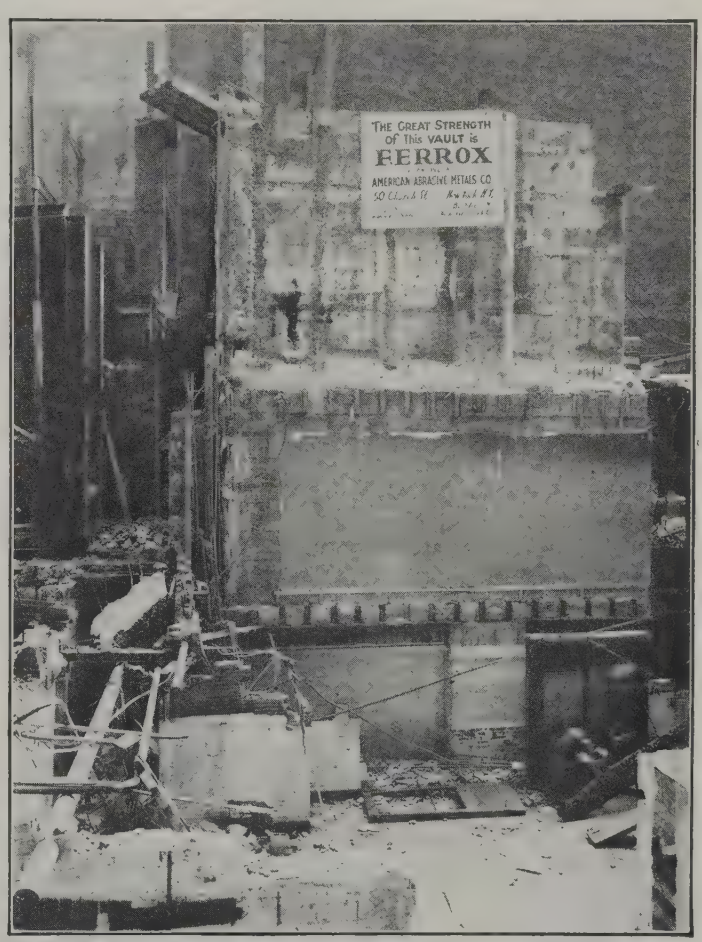
The development of destructive forces since the World War, coupled with the increasing menace of criminal violence, has compelled radical revision of structural elements required for adequate safeguarding of funds and securities.

Armor plate, manganese steel, etc., that successfully defeated attack by drill and explosives, have become obsolete, because of the ease with which they are cut with the torch. A 6-in. plate of such material is pierced in a few seconds and a manhole cut within a few minutes. Masonry walls alone are inadequate. Concrete with lightweight reinforcing yields readily to attack with sledges and chisels; with heavy reinforcing, the torch and wedge attack quickly succeeds.

A combination of electrically protected and properly reinforced concrete with effective drillproof and torch-resistant interlining, Ferrox has been found capable of resisting modern attack. The reinforced concrete is insufficient of itself, but it provides an essential fireproofing and structural element and also retards and interferes with an open attack on the interlining. The linings in such a combination strengthen the concrete in the part it plays and provide the necessary element to defeat chisel, wedge, explosive, torch, and drill attacks.

Ferrox—This product was developed to meet a definite need in bank vault construction. Recognition of its value has spread, so that many of the more important vaults recently built have been Ferrox equipped.

Our engineers on request will gladly discuss details with those interested.



The Mechanics & Metal National Bank Vault
This vault is the one that made the record in resisting demolition—it was Ferrox equipped

Carborundum Anti-Slip Tile

This tile is made of both Carborundum and Aloxite, abrasive products of the electric furnace. These manufactured abrasives have been recognized for years as among the greatest of all grinding materials, and are extensively used for the grinding of steel, iron, brass, bronze and other metals. Both are produced by fusing crude materials in electric furnaces at extremely high temperatures. The resultant crystal masses are taken from the furnace and are broken and crushed to standard sizes of grains or crystals. These crystals are mixed with clays and ceramic materials and moulded into the various sizes and shapes of tile. The tile are then vitrified in high temperature kilns.

Carborundum Anti-Slip Tile presents a gripping, safe surface that can not wear smooth. It is of the same structure and texture, and the same degree of hardness throughout. It retains its safe, anti-slip surface as long as the tile itself lasts.

Advantages of Carborundum Anti-Slip Tile

Carborundum Anti-Slip Tile never loses its anti-slip surface and is practically non-wearing. Under the slight wearing action of traffic it literally renews its safe surface.

It is safe under all conditions. Oil, water or grease does not affect its anti-slip qualities.

The tile is remarkably strong. Tests at room temperature have shown it to have a *transverse strength* of about 5500 lbs. per sq. in.

Carborundum Anti-Slip Tile presents a fine appearance and can be used with any building material such as concrete, marble, granite, brick, steel or wood.

Where this tile is used an even, flat surface is presented underfoot. The tile is laid flush with the stair tread or floor. There are no corrugations, ribs or ridges to cause tripping or to annoy by accumulating dirt.

The resistance of the tile to wear eliminates the cost of maintenance.

Uses of Carborundum Anti-Slip Tile

Stair Treads—For this purpose the tile is made with a rounded nose, giving a safe, secure footing even on the edge of the step.

Treads, such as concrete, slate, marble, wood, metal, etc., may be made safe by the use of Carborundum Anti-Slip Tile suitably applied.

In Concrete—Carborundum Anti-Slip treads can be used advantageously in reinforced concrete stairs, being placed at the time the concrete is poured. In conjunction with tile or terrazzo this tile provides an architecturally pleasing form of stair tread construction, which at the same time is absolutely slip-proof.

Floors—Entrances to shops, stores, moving picture theaters, swimming pool edges, floors in shower baths and lavatories, hotel and theater lobbies, restaurant kitchens, floor landings at elevators, and in industrial plants the floors around dangerous machinery, are made safe from the slipping hazard by the use of Carborundum Anti-Slip Tile. For such purposes the tile may be used solely or in varying proportions with ordinary tile forming designs. It is laid over old floors or incorporated in new construction in the same manner as ordinary tile.

Ramps—In no type of walkway surface is prevention of the slipping hazard so essential as in the construction of ramps. Here the Carborundum Anti-Slip Tile is especially suitable. It will stand up indefinitely under the severest traffic and its architectural attractiveness for finer work does not preclude its use for heavy duty where its anti-slip qualities give needed foot purchase to workmen handling loads.

Entrances—Stores and building entrance floors are made safe for pedestrians by Carborundum Anti-Slip Tile. It eliminates the menace of slippery doorways, gives long service and provides architectural attractiveness. It can be laid solid or in conjunction with ordinary tile to form various designs.

Swimming Pools—Carborundum Anti-Slip Tile is particularly suitable for use along the edges of swimming pools, presenting a safe, secure footing for swimmers. Water does not affect its anti-slip qualities. Such borders should not be less than 18 in. in width.

Specifications for Laying Carborundum Anti-Slip Tile

In Concrete on Floors, Ramps, etc.—Tile to be soaked in water and laid in same manner as ordinary vitrified tile. (Note: detailed specification will be furnished on request.)

In Mastic on Wood, Steel and Concrete Surfaces—Surface shall be thoroughly cleaned and dry. Tile shall be thoroughly cleaned and dry. Surface shall be coated with boiling asphalt roofing mastic of the proper quality, ¼ in. thick, for an area of not more than 4 tile at one time. Lay tile in hot mastic, tamping to level, even surface, keeping joints true to line. Joints shall be 1/16 to ¼ in. wide and filled with hot mastic, trimmed with a knife and ironed with a hot jointer. It is recommended that this work be installed only by experienced men.

In Treads of Concrete Stairways—Pour concrete stairs and finish as usual. When tread is hard enough, just before concrete sets, from area to be covered by tile remove concrete for a depth of ⅝ in. Tamp water soaked tile into concrete to level, even surface. Joints shall be 1/16 to ¼ in. wide and filled with cement grout.

On Wooden Stair Treads—Tread shall be recessed for a depth of 13/16 in. and for length and width to suit number and size of tile to be used. Recessed surface shall be thoroughly cleaned and coated with boiling asphalt roofing mastic 1/16 in. thick. Lay tile in hot mastic, tamping to level, even surface, keeping joints true to line. Joints shall be 1/16 to ¼ in. wide and filled with hot mastic, trimmed with a knife and ironed with a hot jointer.

Tile shall be held in position by 2 wood screws per tile, or by a No. 20 gauge brass, 1x¼-in. angle, toe guard, the 1-in. leg being fastened to wood tread by screws.

On Metal Stair Treads—Metal surface shall be cleaned and a 1½-in. layer of 1:2½ cement mortar placed on tread and finished to proper level. When this bed of mortar is hard enough, just before it sets, from area to be covered by tile remove mortar for a depth of ⅝ in. Tamp water soaked tile into mortar to level, even surface. Joints shall be 1/16 to ¼ in. wide and filled with cement grout.

Diagonal halves furnished with squares at same square foot price.

Carborundum Anti-Slip Aggregates

Used in place of 10 to 20% of the marble chips in terrazzo, or troweled into a granolithic finish, these aggregates, developed especially for the purpose, make such walkway surfaces satisfactorily anti-slip and more durable.

Mason Stair Nosings (in brass or aluminum).
Mason Non-slip Ladder Shoes.
Karbolith Sanitary Flooring.
Mason Safety Nosings.
Mason Safety Edging.
Mason Abrasive Inserts.

Mason Safety Tread (Lead or Carborundum Filled)

Mason safety treads are made of rolled steel or extruded hard brass (delta metal) ¼ in. thick with alternate dovetailed and U-shaped grooves. The dovetailed grooves are filled either with lead, or a mixture containing a large proportion of carborundum and other abrasive substances, firmly held in place by the continuous supporting ribs of hard metal, which give long wear, preserving the non-slipping quality of the tread for a number of years.

Mason Safety Treads Installed on Staircase

The open U-shaped grooves catch and hold any foreign substance, such as pencils, burned matches, cigar ends, wads of paper, etc., giving the foot a sure contact. They can be easily swept or washed out.

The lead can not spread or creep and fill the open grooves. There are no jagged edges for the retention of filth or germs. As the tread wears, it leaves no polished, dangerous, slip-inviting surface.

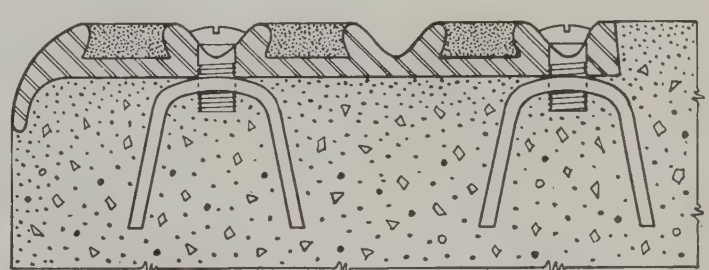
All wood screws, machine screws and nuts, anchors, etc., can be furnished for each installation, when ordered.

Uses of Mason Safety Treads—Mason safety treads are especially desirable for stairs in industrial plants, factories, school buildings, department stores, and wherever the traffic is heavy; for thresholds of doors, elevator openings and fire doors; for ramps and floors around machinery.

Adaptable to all situations, inside or outside of a building, where the surface is liable to become slippery or where steps have worn to an uneven surface.

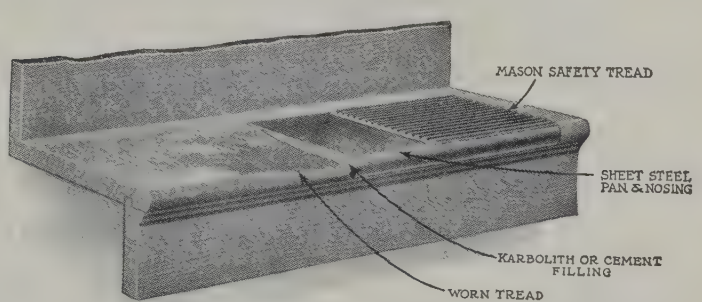
They are suitable for use on granite, marble, slate, cement, iron or wood: and can be installed during new construction or on old work.

They are especially desirable on stairs of concrete, as they prevent the raw edge from chipping off. Special anchors are furnished, which are easily worked into the soft concrete.



Mason Safety Tread as Applied to New Concrete

Repairing Worn Stairs with Mason Safety Tread—For repairing purposes, Mason safety tread is ideal. Badly stair treads are repaired as shown, the worn portion being built up to the proper level with Karbolith or cement filling, on which is placed a sheet steel, brass or aluminum pan and nosing; the safety tread is then placed in position.



Mason Safety Tread as Applied to Worn Treads

Our long experience enables us to give directions for the repair of any stairway, of any material and degree of wear. We will furnish without obligation suggestions, sketches or blue prints, showing just how the work can be done best and at the lowest cost.

6	3	2½	Plain	12A	3	2⅛	Nosing
				14	3	2¾	Nosing
				14A	4	3½	Nosing

Cut to length, punched and countersunk for screws. If other than standard widths are ordered, an additional charge will be made for splitting.

Any concrete work, treads should be ordered with anchors.

Any combination of Nos. 1, 2, 3, 3A and 6 will make any width tread desired without a nosing. The same is true of Nos. 7, 8, 9 and 10.

Any combination of No. 1A, 2A or 4 with No. 1, 2, 3, 3A or 6 will make any width tread desired with one nosing. The same is true of No. 7A, 11, 11A, 12, 12A, 14 or 14A with No. 7, 8, 9 or 10.

No. 5—with nosing and square back edge; especially made for cement and concrete work.

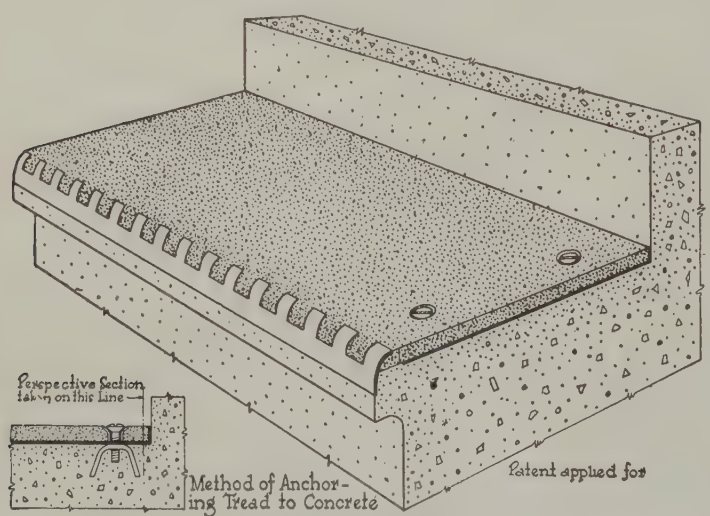
Masonco Saftred (Carborundum Filled Treads with Slip-proof Nosing)

Masonco Saftred is designed to meet the present day demand for a tread that will positively prevent accidents and combine appearance with durability.

Plain nosings of cast iron, steel or other hard materials may prove satisfactory from the standpoint of durability, but even though coated with a thin layer of abrasive, they soon become polished, smooth and slippery. On the other hand, nosings which consist solely of tile or other non-slip materials may prevent slipping, but they do not possess durability.

Masonco Saftred is a perfectly flat tread with a nosing consisting of alternate hard metal and carborundum teeth. The two wear down evenly together, thus insuring both durability and non-slip qualities.

This is the only type of metal-base safety tread with a nosing which not only prevents the foot from slipping forward over the edge of the step, but prevents it from slipping sidewise as well.



Masonco Saftred

How Furnished—Masonco Saftreds are made in one piece, in widths to fit any tread, and in lengths up to 60 in. Nosings are regularly ½ in. deep, but nosings of any special size or shape will be furnished to meet requirements. The treads are shipped with screw holes countersunk, ready for installation.

Repairing Worn Stairs with Masonco Saftred—Instead of tearing out worn stairs, they can be economically and durably repaired with Masonco Saftred.

First build up the worn portions with Karbolith filler, then apply Masonco Saftred with slip-proof nosing built to fit your stair nosing—thus, all evidence of wear or repair will be concealed.

Mason Structural Tread (Requires no Subtread)

Mason Structural Tread is a complete step and safety tread combined. It requires no subtread, can be installed with or without a riser. Furnished ready to bolt to staircase stringers if so desired.

This tread consists of a channeled cast iron base, filled with Mason carborundum filling, which extends to the extreme front edge. The toothed nosing, which is similar to that of Masonco Saftred, prevents any possibility of slipping.

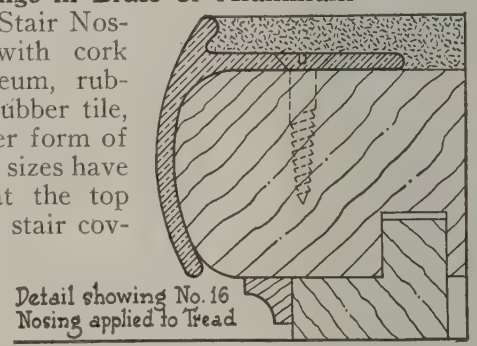
Uses—Mason Structural Tread can be used with any type of iron stair construction. It is particularly recommended for power plants, engine or boiler rooms, industrial plants, factories, schools and for heavy traffic conditions.

How Furnished—Mason Structural Treads are furnished in any tread width; in lengths up to 60 in.; and in thicknesses of ½, 9/16, ⅝ and ¾ in.

The ½-in. thickness is recommended for treads up to 36 in.; the 9/16-in. for treads up to 40 in.; the ⅝-in. for treads up to 48 in.; and the ¾-in. for treads up to 60 in. long.

Mason Stair Nosings in Brass or Aluminum

The "Mason" Stair Nosing is for use with cork composition, linoleum, rubber, interlocking rubber tile, carpet, or any other form of stair covering. All sizes have a vertical edge at the top which protects the stair covering from wear at its edge and prevents slipping. Made in four sizes. For specific details of Mason Nosings see next page.

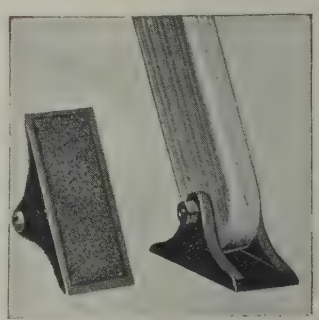


Mason Stair Nosing

Mason Non-slip Ladder Shoes

Many thousands of these ladder shoes are in use throughout the country. They are indorsed and recommended by accident liability companies and recognized by the courts as an efficient safety device.

Illustrations show method of application and abrasive material in bottom of shoes.



Mason Ladder Shoes

Karbolith Sanitary Flooring

A composition with a base largely of magnesium that produces a hard, durable, sanitary surface, proof against rats, fire and germs. It is impervious to heat, cold and dampness, and will not chip, crack, tear loose nor disintegrate. It can be laid over cement, iron or wood, and binds firmly to the base.

Extensively used for flooring of railway cars, industrial plants, offices, laboratories, garages, railroad stations, steamships, etc. We manufacture this flooring and furnish instructions for installing.

Continued on next page

Mason Safety Nosings, Inserts and Edgings

Mason Safety Nosings

Uses—Mason Safety Nosings are for use in combination with linoleum, cork carpet, rubber, interlocking tile, carpet or any other form of stair covering on stairs of wood, concrete, slate, marble, iron, etc.

Design—All types are provided with a deep sturdy lip, which protects the stair, and with a vertical top which is so beveled as to lock the covering securely in place, absolutely preventing the front edge from raising and catching the foot on ascending or descending the stairs.

It also protects the covering at the front edge where the wear is greatest. From a standpoint of appearance, Mason Safety Nosings are unsurpassed.

Sizes—Mason Safety Nosings may be furnished in any of the sizes shown below, in solid highly polished extruded brass.

Figs. 15, 16, 18, 18A and 20 may also be furnished in aluminum, either highly polished or clear satin finish.

All sizes are furnished complete with wood screws, lead plugs or anchors, according to specifications.

Mason Safety Edging

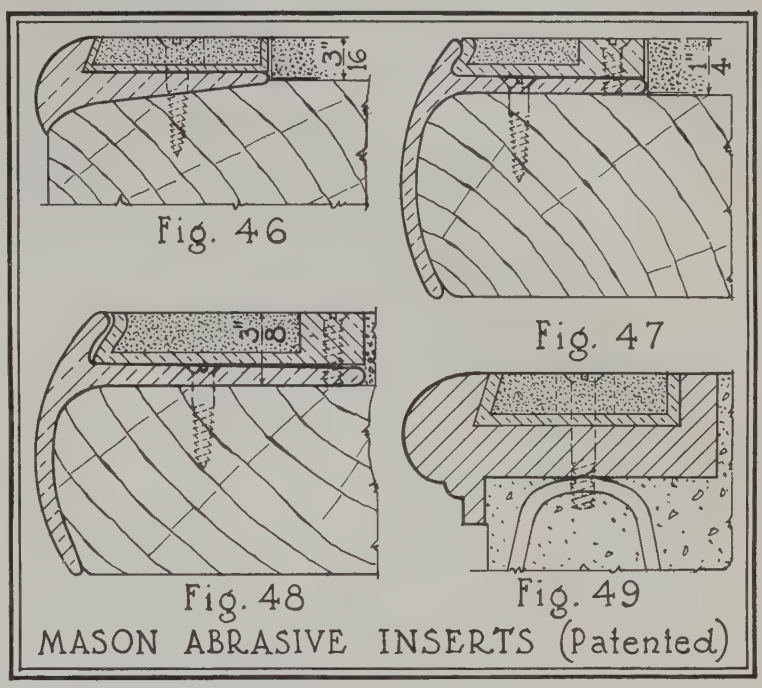
Mason Safety Edgings are for use with linoleum, cork carpet, etc., where only part of a floor is to be covered—such as behind and in front of counters, school, church and theatre aisles, etc.

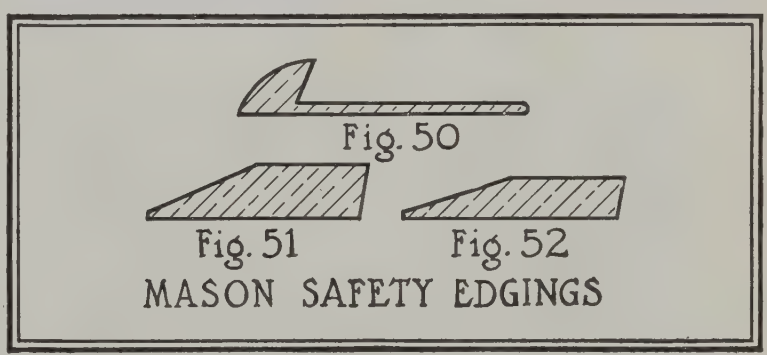
They prevent the edge from being broken by scuffing and subsequent tripping on this edge.

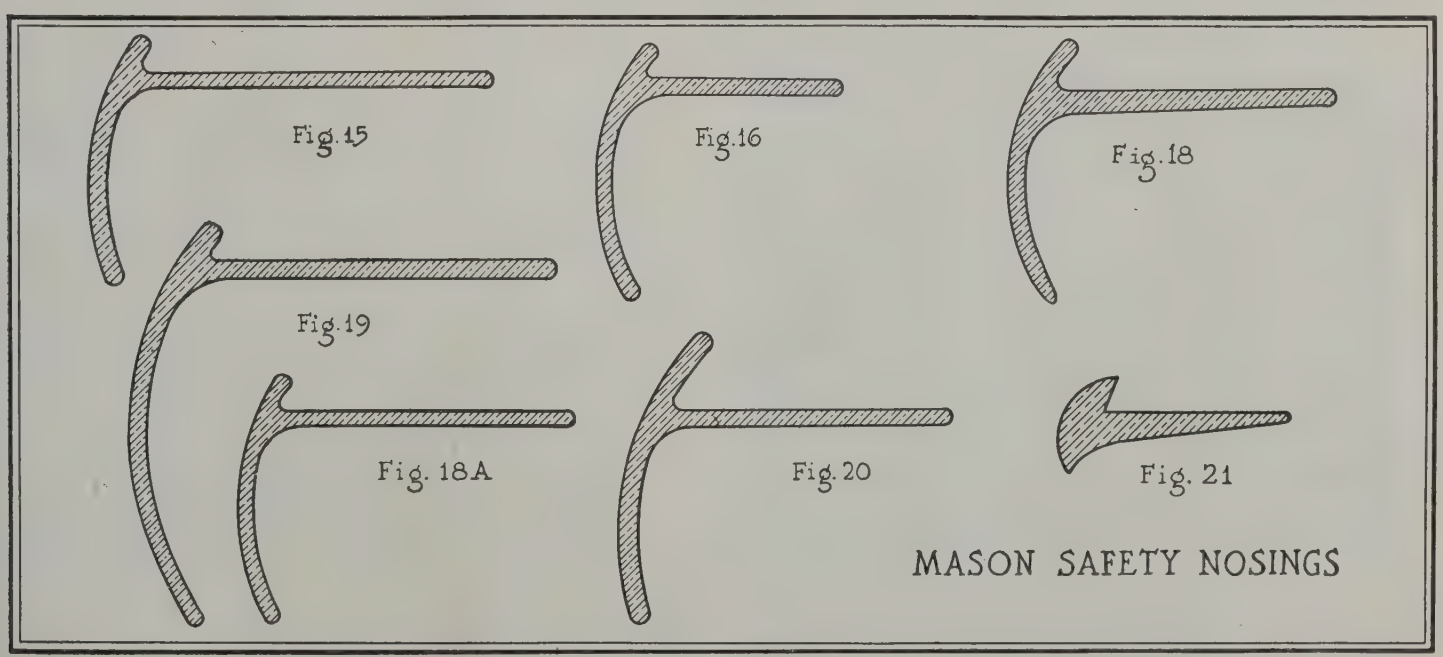
They may be furnished according to the full sized sections shown at right, in solid extruded brass, cut to length, drilled and polished.

Mason Abrasive Inserts

Mason Abrasive Inserts are recommended for use with safety nosings to insure protection to the extreme front edge of the step. They have a high safety factor and are attached to the nosing in such a way that when worn they are very readily replaced without disturbing the stair covering or nosing in any way.







Mason Safety Nosings

NORTON COMPANY

"Norton Floors"—Alundum (Non-slip) Floor and Stair Tiles and Treads

WORCESTER, MASS.

BRANCH OFFICES

NEW YORK, N. Y., 53 Park Place
DETROIT, MICH., 5805 Lincoln Avenue
CHICAGO, ILL., 11 North Jefferson Street
PHILADELPHIA, PA., 4732-46 Stenton Avenue
PITTSBURGH, PA., 338 Third Avenue
CANADIAN PLANT: NORTON COMPANY OF CANADA, LTD., HAMILTON, ONT.

Products

TILE (Semi-Vitreous):
ALUNDUM FLOOR and STAIR TILE.
ALUNDUM CERAMIC MOSAIC TILE.
AGGREGATES:
Alundum Aggregates for terrazzo and for cement, asphalt and composition flooring, and for NON-SLIP ART MARBLE.

Alundum Abrasive

"Alundum" is the trade-mark of an electric furnace abrasive made by NORTON COMPANY and well-known throughout the industrial world. The non-slip and wear-resisting features of Norton Floors are due to the toughness of this abrasive and to the method of bonding it into the form of tiles and aggregates.

Advantages of Norton Floors

Safe—Because of the permanently "non-slip" surface whether wet or dry. Water and oil do not decrease the slip-proof effectiveness of Norton Floors. There are no grooves nor corrugations to cause tripping nor metal nosings to cause slipping.

Durable—Because all Norton Floor products contain hard, tough Alundum abrasive. The wear-resisting surface of Norton Floors will stand up under the most severe traffic conditions.

Quiet—Because the structure of all Norton Floor products is of such character as will prevent reverberation.

Economical—Because Norton Floors are permanently non-slip and extremely wear-resisting the bother and expense of continual replacements is eliminated.

Alundum Floor and Stair Tile (Semi-Vitreous)

Description—The semi-vitreous tile contain 35 to 80% Alundum abrasive bonded with clay. The mixture is pressed in moulds to standard shapes and sizes, and kiln baked.

Uses—***Floor Tile***—Suggested for service walkways in public buildings of all kinds such as railroad stations, schools and industrial plants; for store entrances, elevator landings and ramps.

Stair Tile—Suggested for railway stations, schools, industrial plants and other buildings where protection against slipping and tripping accidents is desirable.

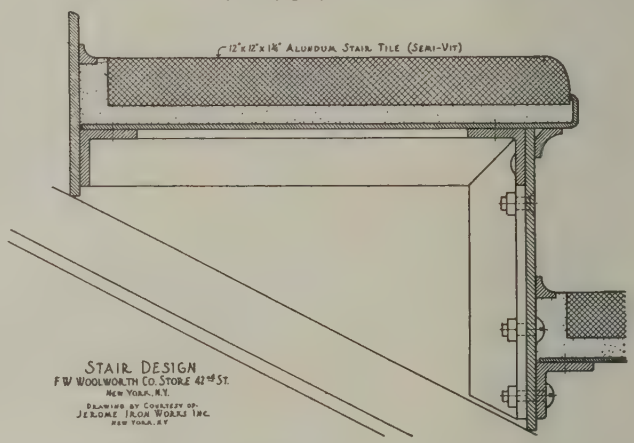
Colors: brown, buff, gray, white granite and green.



Alundum Ceramic Mosaic Tile (Semi-Vitreous)

Description—Alundum Mosaic Tile contains 35 to 80% Alundum abrasive bonded with clay. The mixture is pressed in moulds to standard shapes and sizes, and kiln baked.

Uses—***Alundum Mosaic***—Suggested for store entrances, elevator landings and areas in all public buildings where 100% non-slip, wear-resistant floor is desired and ceramic mosaic tile favored.

Alundum with Vitreous Ceramic Mosaic Tile—Suggested for swimming pools, shower baths, washrooms, and service counters and in all buildings where ceramic mosaic tile is favored and prevention against slipping accident is desirable.

STANDARD SIZES AND COLORS ALUNDUM CERAMIC MOSAIC TILE

Size	Colors
¾ in. square	Brown, white granite, buff, gray, salmon, green
1 in. hexagonal	Brown, white granite, buff, gray, salmon, green
1 1/16 in. square	Brown, white granite, buff, gray, salmon, green
1 1/16 x 2¼ in. oblong	Brown, white granite, buff, gray, salmon, green
2¼ x 1 1/16 in. nosing	Brown, white granite, buff, gray, salmon, green

Alundum Aggregate (Semi-Vitreous)

Description—Alundum Aggregate contains approximately 80% Alundum abrasive bonded with clay. The mixture is pressed in moulds, the blocks being kiln baked and then crushed and screened to standard commercial sizes.

ALUNDUM AGGREGATE (REGULAR)

No.	Size, in.	Colors
2	¼ to ⅜	Brown, gray, buff, green
1	⅛ to ¼	Brown, gray, buff, green
0	1/28 to ⅛	Brown, gray, buff, green

Uses—Alundum Aggregate size No. 1 in standard colors is used in plastic terrazzo (non-slip) flooring also in precast non-slip art marble. No. 0 in standard colors is used for surface treatment of decorative cement floors also for terrazzo (non-slip) flooring. No. 2 is used only where extremely heavy traffic is to be encountered and the wear severe.

Continued on next page

Alundum Aggregate (Cement Floor)

Description—Alundum (Cement Floor) Aggregate is made extremely hard to resist the shock and wear of heavy trucking such as subjected to in floors of industrial plants and roadway surfaces. Alundum (Cement Floor) Aggregate contains approximately 80% Alundum abrasive bonded with clay, the mixture being pressed in moulds. The moulded aggregate blocks are kiln baked and then crushed and screened to "coarse" and "fine" sizes as listed.

ALUNDUM AGGREGATE (CEMENT FLOOR)

Coarse	$\frac{3}{32}$ to $\frac{19}{64}$ in.
Fine	$\frac{1}{32}$ to $\frac{3}{32}$ in.

Not made in different colors.

Uses—Alundum (Cement Floor) Aggregate is used in the topping or surface of cement sidewalks, and industrial flooring (cement or asphalt) subjected to heavy traffic and where a wear-resisting and non-slip (wet or dry) surface is desirable.

Alundum Aggregate Products (Precast)

Description—Precast Alundum Aggregate stair treads, floor tile and thresholds are made in various shapes and sizes, to detail. These products are manufactured in a plant suitably equipped, the material being mixed, cast, surface ground and finished by modern machine methods. The precast products contain Alundum Aggregate with or without marble chips and bonded with cement. Cement colorings are used when required.

Uses—Precast Alundum Aggregate tile and treads are used in all types of buildings where the decorative feature is an important consideration plus the non-slipping and wear-resisting features—such as banks, hotels, theaters, department and chain stores, churches, railroad stations, colleges, schools, and office, civic, fraternal, industrial and other buildings.

Licensees—Arrangements have been made with the Chicago Art Marble Co., 2883 Hillock Avenue, Chicago, Ill., to manufacture under Norton patents, NON-SLIP ART MARBLE and other precast Alundum Aggregate products. Estimates to supply and install Alundum precast products may be obtained from the Chicago Art Marble Co. or from local marble dealers. The name and address of other licensees, located in the metropolitan district of New York also in the New England states, furnished upon request.

Specifications

Suggested form as follows:

(1) Furnish and install where shown on accompanying drawings, Alundum Products as manufactured by NORTON COMPANY, Worcester, Mass., and as below specified.

(2) Floor tile, where shown on plans, shall be Alundum Floor Tile, semi-vitreous, (state size, thickness, shape and color) as manufactured by NORTON COMPANY, Worcester, Mass.

(3) Stair tile where shown on plans shall be Alundum Stair Tile, semi-vitreous, (state size, thickness, shape and color) as manufactured by NORTON COMPANY, Worcester, Mass.

(4) Ceramic mosaic, where shown on plans shall be Alundum Ceramic Mosaic Tile (state size) as manufactured by NORTON COMPANY, Worcester, Mass. Colors and designs as indicated on plans or as specified.

Recommendation: Place above in tile specification. If Alundum mosaics are wanted set with vitreous ceramic mosaic tile, so state in specification.

(5) Aggregate thresholds where shown on plans shall be precast Alundum Aggregate Thresholds as manufactured by licensee of NORTON COMPANY, Worcester, Mass. To detail as indicated on plans, color combination as selected or sample approved.

(6) Aggregate floor tile where shown on plans shall be precast Alundum Aggregate Floor Tile (state size, shape) as manufactured by licensee of NORTON COMPANY, Worcester, Mass. To detail as indicated on plans, color combination as selected or sample approved.

Recommendation: Place above (5) and (6) in tile (or marble) specication.

(7) Aggregate stair treads where shown on plans shall be precast Alundum Aggregate Treads as manufactured by licensee of NORTON COMPANY, Worcester, Mass. To detail as indicated on plans, color combination as selected or sample approved.

(8) Art Marble (non-slip) where shown on plans shall be NON-SLIP ART MARBLE as manufactured by the Chicago Art Marble Co., Chicago, Ill. Color combination as selected or sample approved.

Recommendation: Place above (7) and (8) in marble specifications.

(9) Terrazzo floors, where shown on plans shall be Alundum Plastic Terrazzo of color combination as selected or sample approved, the aggregate used as manufactured by NORTON COMPANY, Worcester, Mass.

Recommendation: Place above in terrazzo specification.

(10) Cement floors, where shown on plans shall have embedded in the surface Alundum Aggregates (state size and amount per square yard or per square foot) as manufactured by NORTON COMPANY, Worcester, Mass.

Recommendation : Place in cement floor finish specifications.

(11) **Samples**—When requested and before proceeding with the work, the contractor shall submit to the architect a sample of the product as may be indicated on plans or as specified.

(12) **Setting**—Before proceeding with the work, the contractor shall obtain from the manufacturers complete information for satisfactory installation of the products as specified.

(13) **Protection**—After completion, protect all work from dirt, stain or injury until the building or work has been completed and accepted.

Products

STANDARD NON-SLIP TREADS; STANDARD "PROTECTIVE" and "SURE-GRIP" STAIR NOSINGS; STANDARD "PROTECTIVE" FLOOR EDGINGS.

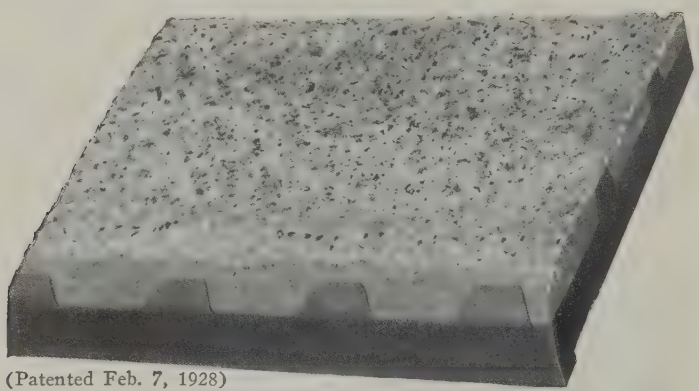
Standard Non-Slip Treads

Standard Non-Slip Treads consist of cast iron or bronze with a flat wearing surface of a hard abrasive mixture. They have three outstanding and distinctive features, viz.: the depth of the wearing surface, the absence of deep grooves and the design of the nosing.

The wearing surface is not superficial, but extends down almost to the base. The absence of deep grooves and corrugations gives more non-slip surface and eliminates all chances of the shoe catching and tripping the wearer.

In the nosing the abrasive is likewise carried down to a *considerable depth which affords absolute protection against slipping where the wear is the greatest.*

This nosing feature, as well as the unusual depth of the abrasive, has resulted in the Standard Safety Tread receiving wide recognition in the profession.



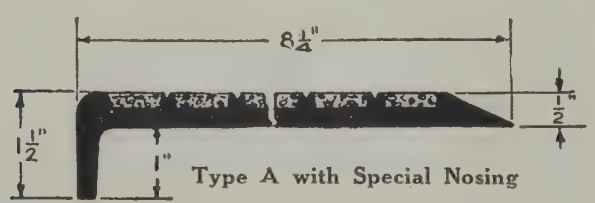
(Patented Feb. 7, 1928)

Standard Non-Slip Tread Showing Nosing with Abrasive Carried Down to a Considerable Depth

Absolute protection against slipping where the wear is greatest

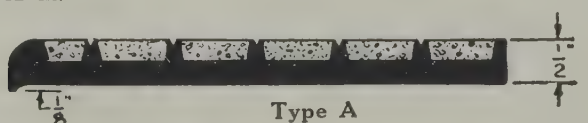
Types

Type "A", with Special Nosing 1 in. Deep—For badly worn wood, slate or marble steps. This style can also be furnished, with square instead of beveled back edges, when safety treads are to be rabbetted.



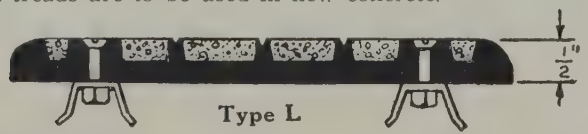
Type A with Special Nosing

Type "A"—Furnished either with lip nosing as shown or flat and with either square or beveled back, in widths from 3 to 12 in.



Type A

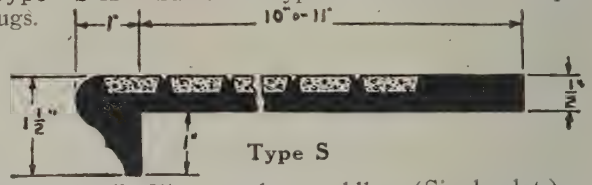
Type "L"—Furnished 3¾, 4¾ and 6 in. wide with full rounded nosing edges, reversible. Anchors attached complete when treads are to be used in new concrete.



Type L

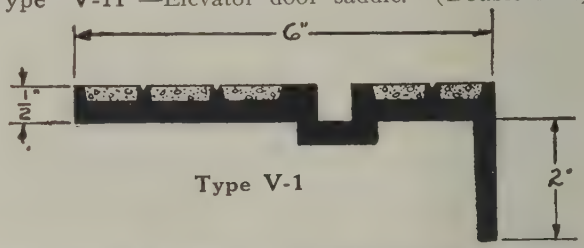
Type "S"—School tread, structural type, holes drilled ready to attach to either riser or stringer brackets.

Type "S-K"—Same as Type "S" but with kick plate or end lugs.



Type S

Type "V-1"—Elevator door saddle. (Single slot.)
Type "V-11"—Elevator door saddle. (Double slot.)



Type V-1

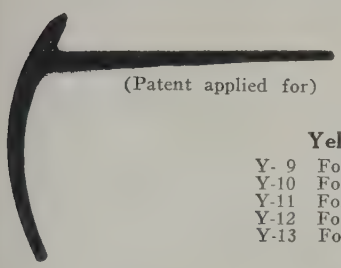
Standard Stair Nosings

"Protective" Type—

Designed to protect the front edges of steps and platforms, used in conjunction with linoleum, cork, rubber tile, mastic and similar floor coverings.

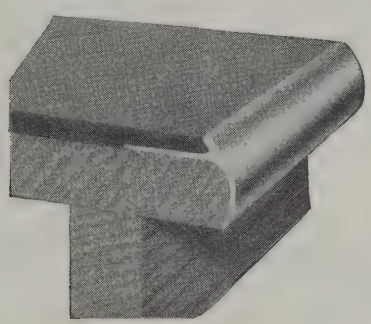
The tapered flanges permit the flooring material to lie flat, making rabbeting of the steps unnecessary, thus reducing installing costs to a minimum.



(Patent applied for)

Yellow Brass

Y- 9 For ⅛-in. material
Y-10 For 3/16-in. material
Y-11 For ¼-in. material
Y-12 For ⅜-in. material
Y-13 For ½-in. material



White Metal

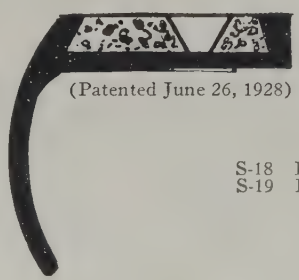
W-14 For 3/16-in. material
W-15 For ¼-in. material
W-16 For ⅜-in. material
W-17 For ½-in. material

The extreme wide flanges also insure successful installation not only on wood but also on marble, slate or stone steps as well, without danger of breaking the front edges in drilling screwholes.

Furnished in both yellow brass and white metal aluminum with hardening alloy.

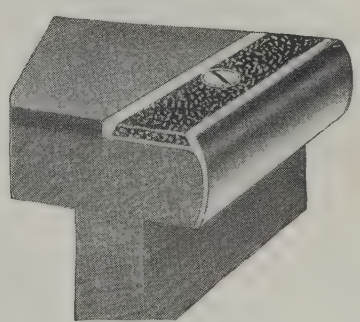
"Sure-Grip" Type—

A protective nosing for flooring material and a safety tread combined for use on stairs where the traffic is extremely heavy, the hard abrasive filler preventing slipping. This type of nosing as well as the flooring material can be reset or renewed independently of each other.



(Patented June 26, 1928)

S-18 For 3/16-in. material
S-19 For ¼-in. material



Screws bear on metal sleeves inserted in the abrasive filler.

Provided with anchors attached, when desired, when nosings are to set in new concrete, terrazzo, composition or concrete.

Furnished in yellow brass only.

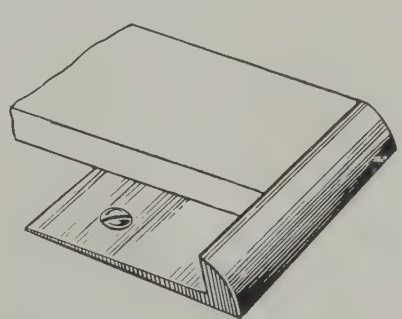
"Protective" Floor Edgings

Designed to protect the edges of linoleum, rubber tile and similar flooring materials at door entrances, aisle passageways, table and desk tops, etc.

The flanges reinforce the edging in such a manner that it lies level at all stages of wear and all unsightly screws are concealed by the flooring material.

E-20 For ⅛-in. material
E-21 For 3/16-in. material
E-22 For ¼-in. material
E-23 For ½-in. material

Furnished in yellow brass only



Stocks Carried

All types of nosings and edgings carried in stock, thus insuring prompt service, furnished, cut to size, holes drilled and countersunk, the yellow brass with highly polished finish and the white metal with brush finish.
